Pigs	7,000	2,100	9,059 (33.0%)	9,030 (30.8%)
Sheep and goats	8,100	2,000	6,364 (6.9%)	8,343 (7.5%)
Horses	5,500	2,600	4,573 (21.8%)	2,469 (16.4%)

*In pre-1939 territory. †Figures given by A. I. Kirichenko, the first secretary of the Ukrainian Communist party, in his report to the Central committee (Oct. 14, 1953).

30% of the bread grain crops in the U.S.S.R. (*see* Table III). However, no reliable data were to be obtained for agricultural production of the Ukraine after 1935. The livestock figures are given in Table IV.

So much decentralization of the constantly growing Soviet industry had been achieved that the share of the Ukraine in the Soviet economy was considerably smaller in 1951 than in 1913. (*See* Table V.)

TABLE V.—*Contribution by Ukraine to Soviet Industrial Production*
(In thousand metric tons; electricity in million kw.hr.; with percentages of the total Soviet output)

	1913*	1940*	1951†
Coal	22,760 (78%)	83,728 (50%)	93,775 (33%)
Iron ore	6,388 (80%)	18,900 (60%)	23,814 (48%)
Pig iron	2,832 (68%)	9,183 (62%)	10,836 (49%)
Steel	2,300 (55%)	8,622 (47%)	10,174 (33%)
Electricity	452 (24%)	11,938 (25%)	16,713 (16%)

*Figures taken from the *Bolshaya Sovietskaya Entsiklopedia: S.S.S.R.*, (Moscow, 1948).
†Estimates based on a report of L. G. Melnikov, first secretary of the Ukrainian Communist party (17th congress, Kiev, Sept. 24–26, 1952).

UKRAINIAN LANGUAGE. This is the lineal descendant of the colloquial language of Kiev Russia and is less like Russian than is White Russian. Indeed, the last forms the link between them, as it has transitional dialects to both. On the other hand, there is no transitional dialect between Ukrainian and Russian. Ukrainian dialectal characteristics occur in mediaeval manuscripts as early as the 12th century, especially those originating in the west. They become very marked after the destruction of Kiev in the 13th century and the gradual incorporation of considerable parts of Ukrainian territory in the Grand Duchy of Lithuania. The official language of this state was White Russian (Byelorussian) till this was displaced by Polish in the 16th century. White Russian and Polish were used mainly in legal documents at that time, and Ukrainian figured in writs and private usage as it had since the 14th century. In the 16th the Reformation impinged on Ukrainian, as on White Russian and Polish, religious literature. The 17th saw a Ukrainian form of Church Slavonic in wide use among nationally minded Ukrainian scholars. But at the same time a more colloquial form of this language was used for scholastic verse and interludes. It is out of this colloquial style that modern literary Ukrainian emerged at the end of the 18th century with the *Enejida* of I. Kotljarevśkyj. Since then the language, like modern White Russian, has been used not only for literature but for academic and administrative purposes. Like White Russian, it has a large body of Polish words and expressions, although here again the fundamental linguistic features are of independent development.

Phonetically Ukrainian differs from Russian in its itacism or intermediate vowel between *i* and *u* (something like the English *i* in "sit"); the use of bilabial *w*, written *v* and found finally and before consonants (*cf. buv* "was," *vovk* "wolf" with Russian *byl, volk*); the affricates *dz* and *dž;* the glottal fricative *h*, as in White Russian; *chv* for *f* in many instances; hardened labials and final *r*, as in White Russian (*cf. krov* "blood" with Russian *krov'*); long soft consonants (*cf. korinnja* "roots," *žyttja* "life" with Russian *koren'ja, žit'jo*); and the retention of final voiced consonants (*cf. gorod* "town" with Russian *gorot*). Phonologically we have the alternation of *i/o* and *i/e* as in the nominative-genitive singular *vil/vola* "ox"; *pič/peči* "stove" (*cf.* Russian *vol/vola; peč/peči*), the closer vowel figuring in the closed syllable; and, as in White Russian, the alternation of *h/k/ch* with *z/c/s* (*cf.* nominative singular *noha* "leg," locative *na nozi*, with Russian *noga, na noge*). Ukrainian morphology is distinguished by retention of the vocative singular (*e.g., žinko!* "woman!"), the extensive use of forms of the Old Church Slavonic *ŭ*-declension (*cf.* genitive singular *snehu* <*snih* "snow" with Russian genitive singular *snega*), contracted adjectival forms in the feminine and neuter nominative singular (*cf. zelena/zeleno* "green" with Russian *zeljonaja/zeljonoje*), a new future made by compounding the infinitive with the present tense of the auxiliary "to have" (*cf. chodytymu* "I shall go" with Russian *budu chodit'*), and the absence of the *t*-ending in the present tense of first-conjugation verbs (*cf. nese* "he/she carries" with Russian *nesjot*). Syntactically a notable feature of Ukrainian is the impersonal neuter passive construction, which is found also in Polish, but not in Russian and White Russian (*cf. dveri vidčineno* "the door has been opened" with Polish *dano trzecią potrawę* "the third course has been served").

UKRAINIAN LITERATURE. A literary language, so-called Church Slavonic came to Kiev from Byzantium with Christianity (988). The first original works were the *Chronicle* of Nestor and the Kiev Lavra hagiography and sermons. Among prominent later works were *The Discourse on Law and Grace* of Metropolitan Ilarion (11th century); *Pilgrimage* of Abbot Danylo; and *Instruction to Children* by Volodymyr Monomakh (12th century) and *The Lay of Igor's Campaign* (*see* RUSSIAN LITERATURE: *Kievan Period*). The sack of Kiev (1169) by Andrey, prince of Suzdal, and the Mongol invasion (1240) caused a transfer of cultural activity to Volhynia and Galicia. The colorful *Galician-Volhynian Chronicle* (1205–92) is a monument of this period.

Delayed influence of the Renaissance and Reformation in western Europe stimulated a cultural revival in the Ukraine, with new translations of the Gospel, establishment of the first university schools (collegiate edition of Bible in Ostroh, 1581) and a wealth of religious polemics. Ivan Vyshensky (d. 1625) was the outstanding polemist of the time. Poetic songs and the oral historical *dumy* appeared. A new Cossack aristocracy revitalized culture in Kiev, where Metropolitan Petro Mohyla (1596–1647) founded his academy in 1633. The Baroque literary period developed there, flowering especially in the 18th century. Prominent writers included the poet, dramatist and author of the monumental *Lives of Saints*, Dmytro Tuptalo (1651–1709); the master of interludes, M. Dovhalevsky; the epigrammatist, I. Velychkovsky (d. 1726); and the poet and philosopher Hryhory Skovoroda (1722–94). Literary language, still adhering to the traditional church style, turned more frequently to the vernacular in this period.

Classical literature at the time could not develop because of political reasons. Theofan Prokopovich (1681–1736), a dramatist and literary theoretician, became the political philosopher of Tsar Peter I. Ivan Kotlyarevsky (1769–1838), in his comedies and his travesty of Virgil's *Aeneid*, used the vernacular exclusively.

Kharkov university (1805) became the centre of romanticism. The ethnographic publications of N. Tsertelev (1819) and M. Maksymovych (1827–49), and the first attempts to interpret Ukrainian history scientifically (D. Bantysh-Kamensky), plus interest in history and folklore (as in the works of I. Sreznevsky) gave an impetus to romantic poetry: L. Borovykovsky (1806–89), A. Metlynsky (1814–70) and Mykola Kostomarov (1817–85) and, in Western Ukraine, Mykola Ustyanovych (1811–85). But it took the genius of Taras Shevchenko (1814–61) to breathe a new national spirit into romanticism and into all of Ukrainian litera-

ture. Panteleymon Kulish (1819–97), translator of the Bible and of Shakespeare, poet, historical novelist and essayist, enriched and developed it. Marko Vovchok (1834–1907), a prose writer, and I. Karpenko-Kary (1845–1907), playwright, ended the romantic period and introduced that of modern realism.

Modern Ukrainian literature was first headed by Ivan Franko (1856–1916), a great writer, and by the outstanding dramatist and poetess Lesya Ukrainka (1871–1913). Masters of impressionist prose were Mykhailo Kotsiubynsky (1864–1913) and Vasyl Stefanyk (1871–1936). The best in pure lyricism was written by O. Oles (1878–1944).

World War I, with the fall of tsarism and the Ukraine's struggle against Soviet Russia (1918–22), gave literature a further impulse. Pavlo Tychyna (1891–) was a new type of lyricist. Founded on Kievan tradition, a poetic school of neoclassicists appeared, revering antiquity and Parnassianism; it was headed by the erudite Mykola Zerov (b. 1890, deported 1933) and Maksym Rylsky (1895–), the most outstanding poet of the period. Masters of the modern novel were Valerian Pidmohylny (b. 1901, deported *c.* 1934) and Yuriy Yanovsky (1902–54); a master of drama was Mykola Kulish (b. 1892, deported *c.* 1934).

The Soviets began suppressing Ukrainian literature in 1923, and by 1929–30 there was a mass liquidation of authors and removal of their works from circulation. The novelist and pamphleteer Mykola Khvylovy (1893–1933) made heroic attempts from 1925 to 1930 to stem this activity conducted in the name of Communism and to organize an opposition but in the end committed suicide.

As a result, literature could develop freely only in the west (Lwow and Prague). Prominent writers beyond the boundaries of the Soviet Ukraine were M. Cheremshyna (1874–1927), Olha Kobylanska (1865–1942) and the historical novelist Kateryna Hrynevych (1875–1947); the lyricists Yuriy Darahan (1894–1926), Oleh Olzhych (1909–44), Yuriy Lypa (1900–44), Yuriy Klen (1891–1947) and others; and the essayist-critic Dmytro Donzov (1883–). UKULELE. A small guitar (*q.v.*) used by the natives of the Hawaiian Islands and adopted as a jazz and solo instrument in England and the United States.

ULAN (*Uhlan*), originally a Polish lancer. The Ulans were cavalry and wore the national dress and czapka (or lancer cap). They were first introduced into the Prussian army in 1740, but failed to distinguish themselves in the first Silesian War, and it was only after the treaty of Tilsit (1807) that Ulan regiments were again formed in the Prussian army. In the German army the old Ulan regiments have been represented in most cavalry regiments by at least two squadrons. In the Austrian army an "Uhlanpulk" of Poles was formed in 1784 and ordinary Uhlan regiments of Austrian cavalry in 1791. In the Polish army there are a number of Uhlan regiments.

ULAN BATOR ("red knight"), previous to 1921 called Urga (from Orgo-palace), capital of Outer Mongolia, on an affluent of the Tola river. It was the holy city of the Mongols and the residence of the "living Buddha," metropolitan of the Kalka tribes, who ranked third in degree of veneration among the dignitaries of the Lamaist Church.

In 1920, White Russians under the "mad baron" Ungern-Sternberg occupied Urga. After defeating them, 1929, Soviet Russia remained in control of Urga and Outer Mongolia, although Chinese suzerainty was recognized. Urga, as seat of the government of the Russian-sponsored People's Revolutionary party, was renamed Ulan Bator. When in 1924 the living Buddha died, reincarnation was not permitted, and the palace became a museum. Formerly 13,000 of the city's 85,000 people were lamas; in 1939 theoretically no lamas remained. The two representative bodies, the great and small khuruldan, meet in Ulan Bator. In 1932 a magnificent theatre was opened, with revolving stage and several thousand seats. Ulan Bator has also a radio station, several papers and magazines, high schools, a university, veterinary college, medical school and a military school with Russian advisers.

ULAN UDE (formerly Verkhne-Udinsk), a town of Asiatic Russia, the capital of the Buriat-Mongol A.S.S.R. It is on the Uda river, at its confluence with the Selenga, and has steamer communication with Lake Baikal, and southward with Mongolia. It is also on the Siberian railway and grew markedly after the railway was constructed in 1905. The climate is extreme, average July temperature 66.2°, Jan. −17.3° F. The water supply to the railway in winter is a difficulty, since the ground is frozen and water pipes cannot be buried below frost level. Pop. (1939) 129,417. The town was on the 18th-century military Siberian road and was formerly a great centre for the tea trade from Mongolia via Kiakhta. (*See* TROITSKOSAVSK.)

ULCER. An ulcer is a lesion of the skin or any mucous membrane characterized by a loss of the surface epithelium and more or less of the underlying connective tissue. The term is also applied to lesions of the aorta and the valves of the heart in which there is a loss of the lining endothelium. An ulcer has a depressed floor or crater surrounded by sharply defined edges which are sometimes elevated above the level of the adjoining surface. The floor of an ulcer is formed by granulation tissue which is usually infected from bacterial contamination. Since many ulcers are cancers, it is most important to the patient to know whether the ulcer is benign or malignant (cancerous). Benign ulcers are usually caused by infections or by nutritional disturbances. The ulcers on the legs of persons with varicose veins are caused by the slow circulation of the blood in the skin. Any infection under the skin such as a boil, a carbuncle or a tuberculous lesion may break through the surface and form an inflammatory ulcer. The significance of an ulcer is best explained by a separate consideration of the different regions of the body in which ulcers develop. When an ulcer of the skin has been present for a month or longer the possibility of cancer must always be considered. If the edges of the ulcer are hard and the patient is past middle life, the probability of cancer is still greater. Ulcers on the vermilion border of the lower lip in elderly men are nearly always cancers. Women rarely develop cancer of the lower lip. Such cancers must be recognized and treated early before they spread and become inoperable. The superficial ulcers on the lips, the ordinary "cold sores," are caused by a virus and are of no serious significance.

Ulcers in the mouth and throat are frequently caused by infection but are more often cancerous, especially in older individuals. The malignant ulcers usually have hard edges. In diphtheria there is often extensive ulceration of the throat. Ulcers in the oesophagus are nearly always cancers.

Peptic ulcer refers to an ulcer in the part of the intestinal tract bathed by the gastric juice; *i.e.,* the stomach and the first segment of the duodenum. Ulcers do not occur in the duodenum below the ampulla where the alkaline bile and pancreatic secretion enter and neutralize the gastric acid.

Peptic ulcer is a common disease of unknown cause. Ulcers in the duodenum are four or five times as frequent as ulcers in the stomach. The patient has pain or distress of some kind in the epigastric region which is related to the time of eating and the kind of food taken. Peptic ulcers may bleed into the intestinal tract causing the appearance of tarry stools and the development of anaemia. A large haemorrhage may be fatal. The ulcer may perforate, admitting the intestinal contents into the peritoneal cavity, causing peritonitis. Ulcers in the stomach are frequently cancers but those in the duodenum are rarely malignant. Peptic ulcers in younger persons may usually be controlled or cured by dietary management, but in older individuals peptic ulcers are less responsive to medical management and may require surgical intervention. At mid-20th century a majority of surgeons favoured a total or subtotal gastrectomy for intractable peptic ulcer. This operation removes the greater part of or all the gastric mucous membrane which secretes acid. Acid plays an important role in the causation of peptic ulcer.

Ulcers in the small intestine occur chiefly in the terminal portion not far from its entrance into the large bowel. The most frequent causes of ulcers in the terminal ileum are typhoid fever and tuberculosis. In the large bowel single large ulcers are usually cancers. Cancerous ulcers are most frequent in the rectum but may develop in any part of the colon. They cause pain, constipation and blood in the faeces. They are highly malignant cancers and can be successfully

removed only when recognized in an early stage. Ulcerative colitis refers to a disease in which hundreds of small ulcers develop in the mucous membrane of the large intestine. Some cases are caused by amoebic dysentery and some by bacillary dysentery but in the majority of cases no cause can be established. The cases of unknown causation are the most difficult to treat and it is sometimes necessary to remove the entire large intestine.

Ulcers developing in the urinary bladder may be inflammatory or cancerous in nature. Cancers of the bladder are highly malignant and few cures are effected.

Ulceration of the valves of the heart occurs in bacterial endocarditis. Bacteria, usually streptococci, lodge in the valve leaflets and produce an inflammation which destroys the surface of the valves and makes an ulcer. This disease was almost invariably fatal before the introduction of penicillin, but many cases of bacterial endocarditis have been cured by penicillin. (E. T. Be.)

ULEABORG: *see* Oulu.

ULEMA, the learned of Islam, theologians, canon lawyers, professors, judges, muftis, etc., all who, whether in office or not, are versed theoretically and practically in Moslem science in general. (Arab. *'ulamā*, sing. *'ālim*, literally, "knowers," in the sense of *scientes*.) By "science" in this case is especially meant what is learned from tradition, books or men and through the intellect. In a narrower sense, Ulema is used, in a Moslem state, of a council of such learned men, holding government appointments. If all conception of intermediary priesthood is eliminated, the Ulema may be said to be equivalent to the secular clergy of Roman Christendom (*see* Dervish). Opposed to them, again, are the *'ārifs* ("knowers," "perceivers," *sentientes*, as opposed to *scientes*), to whom religious knowledge comes in the vision of the mystic, not by tradition or reason (*see* Ṣūfīism).

ULFILAS (*c.* 311–383), the apostle of Christianity to the Gothic race, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths at the trans-Danubian provinces about the year 311.

The Arian historian Philostorgius (*Hist. eccl.* ii, 5) says that his grandparents were Christian captives from Sadagolthina in Cappadocia, who had been carried off to the lands beyond the Danube in the Gothic raid of 264, and became so naturalized that the boy received a Gothic name, *Wulfila* (Little Wolf). An authoritative record of the outlines of his life was only discovered early in the 19th century in a writing of Auxentius of Milan, his pupil and companion. At an early age Ulfilas was sent, either as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. Ulfilas may therefore have been a convert to Christianity when he reached Constantinople. But there probably he came into contact with the Arian doctrines which gave the form to his later teaching. For some time before 341 he worked as a lector (reader of the Scriptures). From this work he was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the bishops who were with them," probably at Antioch, in 341.

He was then 30 years of age, and his work as "bishop among the Goths" covered the remaining 40 years of his life. For seven of these years he worked among the Visigoths beyond the Danube, till the success which attended his labours drew down the persecution of the still pagan chief of the tribe. To save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people. With the consent of the emperor Constantius he led them across the Danube, "a great body of the faithful," and settled in Moesia at the foot of the range of Haemus and near the site of the modern Trnovo (349).

The life of Ulfilas during the following 33 years is marked by only one recorded incident (Sozomen iv, 24), his visit to Constantinople in Jan. 360, to attend the council convened by the Arian or Homoean party. The part played by Ulfilas in these troublous times has not been determined with certainty. It may have been he who, as a "presbyter christiani ritus," conducted negotiations with Valens before the battle of Adrianople (378); but that he headed a previous embassy asking for leave for the Visigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favoured by the emperor, and drew with him the whole body of his countrymen—these and other similar stories of the Orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. In 383 he was sent to Constantinople by the emperor. A split seems to have taken place among the Arians at Constantinople. Ulfilas was summoned to meet the innovators, and to induce them to surrender the opinion which caused the dispute. No sooner had he reached Constantinople than he fell sick, "having pondered much about the council," and before he had put his hand to the task which had brought him, he died, probably in Jan. 383.

The Arianism of Ulfilas was a fact of pregnant consequence for his people and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of his own confession—"Ego Ulfilas semper sic credidi." If, as seems probable from the circumstances of his ordination, he was a semi-Arian and a follower of Eusebius in 341, at a later period of his life he departed from this position and vigorously opposed the teaching of his former leader. He appears to have joined the Homoean party, which took shape and acquired influence before the council of Constantinople in 360, where he adhered with the rest of the council to the creed of Ariminum, with the addendum that in future the terms *ὑπόστασις* and *οὐσία* should be excluded from Christological definitions. Thus we learn from Auxentius that he condemned Homoousians and Homoiousians alike, adopting for himself the Homoean formula, "filium similem esse patri suo."

His version of the Scriptures is his greatest monument. By it he raised a barbarian tongue to the dignity of a literary language; and the skill, knowledge and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work. For the linguistic value of the Gothic version of the Scriptures by Ulfilas *see* Goths: *Gothic Language*. It is preserved, though only in a fragmentary form, in the famous *Codex Argenteus* at Uppsala. This manuscript, discovered at the monastery of Werden, near Cologne, was deposited at Prague, carried off by the Swedes in 1648 and presented to Queen Christina. From Stockholm it passed by some means into the hands of Isaac Vossius, and a transcript was made and published by Franciscus Junius in 1655. The manuscript was bought by the count de la Gardie and presented to the University of Uppsala. Its uncial letters are formed in silver on a surface of purple vellum.

ULIANOVSK (formerly Simbirsk), a town in the Kuibyshev region, Russian S.F.S.R., founded in 1648, lying on a hill 560 ft. above the Volga at a point where the Svyaga closely approaches it, in 54° 23′ N., 48° 25′ E. Pop. (1939) 102,106. Its suburbs extend to the Svyaga and to the Volga. Suburbs on the left bank of the Volga are cut off from communication during the spring and autumn, but are reached by boat in summer and sleigh in winter. The town has a brisk river trade and has sawmills, flour mills, breweries, distilleries and brickyards. It has railway communication across the Volga and with the west. The historian N. M. Karamzin was born there in 1766 and Nicolai Lenin in 1870. Ulianovsk was the scene of much fighting during the civil war of 1917–1920.

The former province of Ulianovsk was divided among the Gorki, Penza and Kuibyshev regions and the Tatar A.S.S.R. and Chuvash A.S.S.R.

ULM, a city of Germany, in the *Land* of Württemberg, situated on the left bank of the Danube, at the foot of the Swabian Alps, 58 mi. S.E. of Stuttgart by rail and 63 mi. N.W. of Munich. Pop. (1950) 71,132. Ulm is mentioned as early as 854; it became a town in 1027 and was soon the principal place in the duchy of Swabia. Although burned down by Henry the Lion, it soon recovered from this disaster and became a free imperial town in 1155. Its trade and commerce prospered and in the 15th century it attained the summit of its prosperity, ruling over a district about 300 sq.mi. in extent and having a population of about 60,000. In 1803 Ulm lost its freedom and passed to Bavaria, being ceded

to Württemberg in 1809. In Oct. 1805 Gen. Karl Mack with 23,000 Austrians capitulated there to Napoleon. Ulm is remarkable in the history of German literature as the spot where the Meistersinger lingered longest, preserving without text and without notes the traditional lore of their craft.

Ulm still preserves the appearance of a free imperial town and contains many mediaeval buildings of historic and of artistic interest. Among these are the town hall, of the 16th century, in the Transition style from late Gothic to Renaissance, restored in recent years; the Kornhaus; the Ehingerhaus or Neubronnerhaus, containing the industrial museum; and the commandery of the Teutonic order, built in 1712–18 on the site of a habitation of the order dating from the 13th century, and later used as barracks. The magnificent early Gothic cathedral, begun in 1377, and carried on at intervals till the 16th century, was long left unfinished; but in 1844 the work of restoration and completion was begun, being completed in 1890. It has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 ft., its breadth 159 ft.; and the aisles are covered with rich net vaulting. The tower in the centre of the west façade was completed in 1890 and is the loftiest ecclesiastical erection in the world (528 ft.). The cathedral contains some fine stained glass, and a number of interesting old paintings and carvings. It belongs to the Protestant Church.

The Danube, joined by the Iller just above the town and by the Blau just below, becomes navigable, so that Ulm occupies the important commercial position of a terminal river port. There is water communication with the Neckar, and so to the Rhine. The market for leather and wool is important, and the manufactures include wire ropes, borax, paints, cheese, jute, leather, lace, perfumes and cement. Brewing and weaving, iron- and brass-founding are carried on as well. As a fortress Ulm has been famous, and it is a garrison town.

Mollvo (ed.), *Das rote Buch der Stadt Ulm* (1904).

ULMACEAE, a family of dicotyledonous trees, the best known and most important members of which are the elms (*q.v.*), forming the genus *Ulmus*. The family contains 13 genera and about 130 species. *Celtis australis* is the nettle tree, the fruit of which is edible. *C. occidentalis* is the hackberry (*q.v.*).

ULMANIS, KARLIS (1877– ?), Latvian statesman, was born on Sept. 4, 1877, at Berze, Zemgale, a province of Latvia. He studied agriculture in Germany and helped to improve Latvian dairy farming and cattle breeding. In 1905, at the time of the first Russian revolution, he promoted Latvia's movement for political autonomy. After the revolution Ulmanis went into exile in the United States. Having been granted an amnesty, he returned to Latvia in 1913. Shortly after the Russian revolution of 1917 he founded the Latvian Farmers' union, claiming Latvia's independence. With other Latvian leaders he formed a Latvian National council which on Nov. 18, 1918, proclaimed the independence of Latvia and appointed him the head of the provisional government. He remained in power until June 18, 1921, his period of office coinciding with years when freedom had to be defended not only against the Russian and Latvian Communists but also against the Germans. With a Latvian army formed by Gen. Janis Balodis, he liberated the country and organized the election of the constituent assembly which convened at Riga on May 1, 1920. Peace with Soviet Russia was concluded on Aug. 11, 1920. Ulmanis was again premier from Dec. 1925 to May 1926, and from March to Dec. 1931. Since in the Latvian *saeima* (parliament) of 100 deputies there were 24 political parties, every government was necessarily a somewhat unstable coalition. Ulmanis returned to power for the fourth time on March 17, 1934, at a time of great political tension created by the Communists and right-wing nationalists (the Perkonkrustiesi or Thundercrosses). A third element of disloyalty was the nazified German minority. On May 15 he suspended the constitution and, backed by the army, established an authoritarian regime. On April 11, 1936, Ulmanis became president of the republic also, with General Balodis as vice-president. In June 1940 he accepted a Soviet ultimatum to form a "friendly" government headed by August Kirchensteins. Ulmanis and Balodis were arrested on July 21, 1940, and deported to the U.S.S.R. Their fate remained unknown. (K. SM.)

ULMUS: *see* ELM.

ULPIAN (DOMITIUS ULPIANUS) (170?–228 A.D.), Roman jurist, was of Tyrian ancestry. He made his first appearance in public life as assessor in the *auditorium* of Papinian and member of the council of Septimius Severus; under Caracalla he was master of the requests. Heliogabalus banished him from Rome, but on the accession of Alexander (222) he was reinstated, and finally became the emperor's chief adviser and prefect of the praetorian guard. Curtailing privileges granted to the guard by Heliogabalus, he provoked their enmity and narrowly escaped their vengeance; at last, in 228, he was murdered in the palace during a riot between the soldiers and the mob.

His works include *Ad Sabinum*, a commentary on the *jus civile*, in more than 50 books; *Ad edictum*, a commentary on the edict, in 83 books; collections of opinions, responses and disputations; books of rules and institutions; treatises on the functions of the different magistrates—one of them, the *De officio proconsulis libri x*, being a comprehensive exposition of the criminal law; monographs on various statutes, on testamentary trusts and a variety of other works. His writings altogether have supplied to Justinian's *Digest* about a third of its contents, and his commentary on the edict alone about a fifth. As an author he is characterized by doctrinal exposition of a high order, judiciousness of criticism and lucidity of arrangement, style and language.

Domitii Ulpiani fragmenta, consisting of 29 titles, were first edited by Tilius (Paris, 1549). Other editions are by Hugo (Berlin, 1834), Böcking (Bonn, 1836), containing fragments of the first book of the *Institutiones* discovered by Endlicher at Vienna in 1835, and in Girard's *Textes de droit romain* (Paris, 1890).

ULSTER, EARLS OF. The earldom of Ulster was the first title of honour in Ireland of English creation, and for more than a century was the only one. It dates from a grant to Hugh de Lacy in 1205. Hugh de Lacy, 1st earl of Ulster (d. 1242?), was descended from Walter de Lacy (d. 1085), who fought for William the Conqueror at Hastings. The first earl was the brother of Walter de Lacy (d. 1241), who succeeded his father as lord of Meath in 1186. In 1203 Hugh de Lacy drove John de Courcy out of Down and was rewarded by grants of land and in 1205 by the earldom of Ulster. He was then invested with quasi-viceregal authority, but in 1207 war broke out between the earl and the king's justiciar. King John came to Ireland and banished the earl to Scotland. He returned to Ireland in 1226, and died at Carrickfergus. On his death the earldom reverted to the crown.

A second creation followed, when Prince Edward (later Edward I) transferred "the county of Ulster" (*c.* 1255) to Walter de Burgh, lord of Connaught. The earldom remained in the family of De Burgh until the death of William, 3rd earl of this line, in 1333, when it passed to his daughter Elizabeth, who married Lionel, afterward duke of Clarence, son of Edward III. Lionel was succeeded in the earldom of Ulster by his daughter Philippa, who married Edmund Mortimer, earl of March. The third Mortimer earl of Ulster died unmarried in 1425, when his titles were inherited by Richard Plantagenet, duke of York, whose son Edward ascended the throne as Edward IV in 1461.

Since that date the earldom of Ulster, which then merged in the crown, has been held only by members of the royal family. In 1928 it was bestowed upon H.R.H. the duke of Gloucester.

ULSTER, the ancient northeastern province of Ireland, had a varying frontier and is now roughly coextensive with Northern Ireland. Uladh was its ancient Gaelic name, and the ending "ster" was of Norse origin. At the beginning of the Christian era a kingdom of Ulster stretched from the Shannon to the Boyne, with its chief stronghold near Armagh. By the close of the 4th century this had broken up and the name Ulidia was applied to an area roughly corresponding to the modern Down and Antrim. John de Courcy invaded the area successfully in the last quarter of the 12th century and contemporary writers referred to him as "Princeps Ulidiae" and "Conquestor Ultoniae." In 1205 King John deprived de Courcy of his territories and gave them to Hugh de Lacy with the title of earl of Ulster. In Tudor

times the ancient provincial divisions of Ireland were used for administrative purposes. In 1585 Lord Deputy Sir John Perrot caused Ulster to be shired, defining the area of Ulster as the eight counties of Antrim, Down, Armagh, Monaghan, Coleraine, Donegal, Tyrone and Fermanagh. To this Sir Arthur Chichester added Cavan which had formerly counted as part of Connaught. By 1608 nine counties were regarded as making up Ulster. Coleraine became the county of Londonderry in 1613. The nine-county Ulster was made quite arbitrarily and did not correspond to the ancient kingdom or any earlier Ulster. It never had much reality as an administrative entity. The name Ulster has been generally used since 1920 as another name for Northern Ireland, appearing in the titles of many public bodies and institutions; but for a few purposes, including some forms of interprovincial sport, the name still indicates nine counties. The three counties of Cavan, Donegal and Monaghan form Ulster province (3,123 sq.mi.; pop., 1951, 253,252) in the Republic of Ireland. (Hu. S.)

ULTIMATUM is a technical diplomatic term, derived from the Latin word for "last." It signifies a formal, categorical declaration, addressed by one state to another, to the effect that if certain demands are not met, serious consequences will ensue. These consequences may range from the rupture of the particular negotiations, economic measures, breaking-off of diplomatic relations or threat of force, to the actual application of force in the form of war. An ultimatum is called simple if it does not indicate the measures to be taken by the government sending it. It is called qualified if it indicates the nature of the measures to be taken. Art. i of convention iii, adopted by the second Hague conference (1907), regulates in detail the formalities to be observed with regard to an "ultimatum with a conditional declaration of war." The practical importance of these provisions was greatly diminished by the provisions of the covenant of the League of Nations and of the charter of the United Nations, limiting the right of the member states to use war as an instrument of national policies. It was also diminished by the disregard with which many states treated these provisions.

Diplomatic history abounds with examples of ultimatums. Thus on Aug. 4, 1914, the British ambassador, Sir Edward Goschen, submitted to the German foreign minister, Gottlieb von Jagow, a written statement that, unless Germany would give assurances by midnight that it would proceed no further with the violation of Belgian neutrality, the British government felt bound "to take all steps in their power to uphold the neutrality of Belgium." Again, on Sept. 3, 1939, at 9 A.M., the British ambassador, Sir Nevile Henderson, informed the German government that, unless it would give assurances to the British government by 11 A.M. of the same day concerning the suspension of all aggressive action against Poland, a state of war would exist between the two countries as of that hour. (H. J. Mu.)

ULTIMOGENITURE, the custom by which the youngest son inherits the homestead, is known in English law as Borough English. In England it obtained in parts from Gloucester to Cambridgeshire. Under the name of Mainète and Jungerrecht it was known in northern France and northern Germany. In Assam it is found among the matrilineal Garos who possess the dual organization and speak a Tibeto-Chinese language, among the matrilineal Khasias who speak an Austric language, among patrilineal Lusheis, Meitheis, Nagas and Kachins, speakers of Tibeto-Chinese languages. Cases are known in Africa.

This custom has been regarded as derived from the *jus primae noctis,* the youngest son being of undoubted paternity. This view has been successfully traversed by Blackstone, Westermarck and Frazer. It has been ascribed among settled peoples, such as Nagas and Meitheis, to the custom of making provision for the elder sons as they marry and set up house independently. The rule requiring elders to marry before juniors is found among communities which do not now practise ultimogeniture. Among people like the Lusheis, who practise shifting cultivation, it is due to the custom by which the sons of chiefs, on marrying, swarmed off to found new villages. The view that it is connected with domestic worship is supported by the Khasi evidence, where the youngest daughter "inherits the religion"—in organic association with the homestead. With the Garos it is inseparably connected with the general system of marriage.

See Blackstone's *Commentaries on the Laws of England,* vol. ii; O. Elton, *Origins of English History,* 1st ed. (1888); E. Westermarck, *History of Human Marriage,* 5th ed.; Sir J. Frazer, *Folklore in the Old Testament* (1918).

ULTRACENTRIFUGE: *see* CENTRIFUGE.

ULTRAMARINE is the colour principle of the gem lapis lazuli (*q.v.*) which, besides its use as an ornament, formed the blue pigment used by painters in the middle ages. Ore containing the colour was ground and the powdered lapis lazuli separated from the other mineral matter by an oil pasting process. The blue pigment so obtained is said to have been literally worth its weight in gold. The fact that the product was imported into Europe gave it its name—ultramarine, "beyond the sea."

The value of the material caused great efforts to produce it artificially and these succeeded in the late 20s of the 19th century. It appeared on the market almost simultaneously in France and Germany. To be sure, the ultramarine of those early days was a weak, poor product from the present point of view, but it was the start of a development leading to the pigment of today.

The present process of manufacture is this: more or less equal amounts of china clay, sulphur and soda ash (sodium carbonate) are taken, together with considerably smaller amounts of silica and rosin or pitch. Variations in the proportions of the ingredients are used to cause variations in the shade of the product from a greenish to a reddish blue. The mixture is very finely ground and loaded into crucibles with porous walls. More than 1,000 of these are stacked in a single furnace, which is then slowly fired up to a top temperature of about 750°C. Many and complicated reactions occur among the ingredients of the mix. When the top temperature has been reached, the fire is drawn, the furnace sealed and allowed to cool over a period of about two weeks. During this cooling period the atmosphere of the furnace exerts an oxidizing action upon the crucible contents, of much importance to the character of the product. The crude ultramarine is removed from the crucibles, is washed free from salts, very finely ground and separated by successive sedimentations from water suspension into a series of particle sizes. The varying characteristics required for different uses of ultramarine are satisfied by selection of the desired shade and particle size. For some purposes, the product requires further special surface treatments.

The main fields of use of ultramarine are paints and lacquers, calcimine, linoleum, paper both in whitening and colouring, coloured roofing material, laundry blueing. It has a particularly brilliant blue colour, is very light-fast and is resistant to not too strong alkali, but not to acids. The structure of ultramarine was a matter of much controversy until F. M. Jaeger finally settled the matter in 1929 by the use of the X-ray. Ultramarine, or better, the ultramarines, consist of a framework or lattice of cubical form with truncated corners, built up of aluminum and silicon atoms joined to one another through oxygen atoms. The ratio of aluminum to silicon atoms can vary within limits, but their combined number is always 12. Commonly the silicon atoms outnumber the aluminum atoms. The connecting oxygen atoms number 24. Within the lattice and in the spaces formed by the truncated corners of adjacent lattices are atoms of sodium and sulphur not rigidly fixed as to number or position.

It will be clear from the above why there is a family of ultramarines and why variations in composition exist. The usual percentage limits within which the components fall are the following:

Silicon	17.75	to	20.0%	by weight
Aluminum	12.3	to	15.5%	by weight
Sodium	12.8	to	15.3%	by weight
Sulphur	10.0	to	14.0%	by weight
Oxygen	Balance (except for small amounts of water and impurities)			

The shade and properties of the ultramarines will vary with changes in the proportions of the components. (A. P. B.)

ULTRAMICROCHEMISTRY. The term "ultramicrochemistry" refers to a set of chemical techniques by which chemical analyses and other chemical manipulations are performed on the most minute amounts of material. If a standard analytical method

requires about $\frac{1}{10}$ gram or sample, the micromethod for the analysis would require about $\frac{1}{1000}$ gram and the ultramicromethod about $\frac{1}{1,000,000}$ gram. It is less ambiguous, then, to term ordinary scale or macro-operations as "decigram methods," micromethods as "milligram methods" and ultramicromethods as "microgram methods" (1 microgram = 0.000,001 gram = about 0.000,000,035 oz.). Microchemistry is then "milligram chemistry" (1 milligram = 0.001 gram) and ultramicrochemistry is "microgram chemistry." It is also termed "drop analysis" because a sample of blood or other solution being analysed is usually less than a drop.

Systematic ultramicrochemistry originated in the Carlsberg laboratory in Copenhagen about 1930. The techniques developed there were used chiefly to analyze traces of enzymes, or biological catalysts, in tiny slices of tissues of plants and animals. The techniques applied to this purpose became known as "enzymic histochemistry." They were widely employed by K. Linderstrøm-Lang and his co-workers of the Carlsberg laboratory, as well as by many others, to the solution of fundamental biological problems.

A broader chemical approach was made by Paul L. Kirk and his co-workers at the University of California, starting about 1933. Instead of specific applications to limited types of biological problems, the aim of the California group was to make all kinds of chemical operations practical with microgram quantities, so that any chemical study could be made, regardless of the type of material studied. Although the chief applications of these techniques were also expected to be biological in nature, the general applicability was demonstrated when they were used to develop the chemistry of plutonium, the man-made element used as an explosive in the atomic bomb. Microgram manipulation was made necessary in this case by the fact that only microgram quantities of plutonium could be made by methods then available, and larger amounts could not be manufactured until extensive chemical information was available. Virtually the entire chemistry of plutonium was elucidated before there was as much as a milligram of the material in existence and the huge production plants were constructed with a scale-up of more than a billionfold—an all-time industrial record.

Up to about 1940, the strictly chemical techniques were largely confined to volumetric operations; *i.e.*, measurement of liquid volumes as a means of analysis. This was true of both the Copenhagen and California groups as well as for several other laboratories in which microgram chemistry was being studied or used. Included in these developments were methods for study of chemical changes through gasometric methods depending on measurement of gas volumes, respiration of single cells and of very small organisms or bits of tissue, enzyme catalysed reactions in droplets and various manipulative techniques. During World War II, further advances occurred in ultramicroweighing, submicrogram chemical analysis through colour measurement and chemical study of reacting systems containing only a few micrograms of material through improved manipulative techniques.

Liquid Volumetric Techniques.—Analytical methods depending on measurement of volumes of liquids were peculiarly adaptable to ultramicroanalysis and were the first techniques developed. Titrations were readily performed with burets made from fine capillary tubes, which delivered small volumes of reagent solutions with an accuracy of ±0.02 microlitres or better (1 microlitre = 0.000,001 litre; 1 litre = approx. 1 quart). Liquid samples were measured with the same accuracy by use of the same fine graduated tubing. The blood of a grasshopper, or a droplet from a child's fingertip, could then be measured accurately and its constituents accurately determined by titrating this bit of blood with a capillary buret. Operations other than titration usually needed to be done. If so, techniques for spinning down the corpuscles, removing the protein, ashing the blood, filtering it, stirring it or boiling it were developed and could be used without ever having a greater volume than about one drop of liquid. By such means, quantitative analysis for nitrogen, urea, sugar, amino acids, lactic acid, ammonia, chloride, sodium, potassium, calcium, phosphorus and other common constituents of blood could be performed. Adaptations of these procedures are applicable to the analysis of all types of materials other than blood. They can be valuable in the clinical laboratory by avoiding the difficulty of obtaining large amounts of blood from patients; *e.g.*, infants. They are useful to the research worker who can study insects, some single cells, small plants and animals and their parts which by common methods could not be analysed at all. They can be used for the study of minute amounts of inorganic material such as the radioactive isotopes obtained by the nuclear physicist. The dangers of radioactivity are less with the small sample, and very often only the smallest samples can be obtained.

Gasometric Ultramicromethods.—Methods depending on gas volume changes have been chiefly useful in measuring the respiration rate of cells, tissues and small organisms. Some of these devices have been made sensitive enough to measure the minute trace of oxygen used by single invisible protozoan cells; the most delicate direct instrument used in 1946 was that of B. B. Cunningham and Kirk. Several such instruments could determine the rate of oxygen consumption with slightly larger organisms or tissues. One ingenious device which has been widely used both for respiration and enzyme studies is the Cartesian diver micromanometer which was first described by Linderstrøm-Lang.

Gas analysis also was highly developed as an ultramicrotechnique during World War II. Most significant were the methods of P. F. Scholander and his associates who succeeded in analysing as little as ten microlitres of gas mixtures for their constituent gases with approximately the same accuracy as is possible with large samples. These techniques were applied to various physiological studies.

Weighing.—Although very sensitive balances were developed early in the 20th century, little refinement or use had been made of them until 1942. P. L. Kirk, Roderick Craig and J. Gullberg succeeded that year in combining earlier weighing principles and refining them in a quartz fibre balance which could carry a total load of about 100 milligrams and weigh a sample of 0.3 milligram with a sensitivity of about 0.005 microgram. A human breath weighs about 750,000 micrograms; a dime, 2,500,000. With little loss in load capacity, the sensitivity could be increased by about tenfold. This instrument for the first time made weighing a practical technique of ultramicroanalysis and opened the way for development of all types of investigation of ultrasmall samples which require weight determination.

Colorimetric Submicrogram Analysis.—Most significant of developments in ultramicrochemistry during World War II was the initiation of submicrogram analysis by means of the spectrophotometer. By using specially designed capillary absorption cells, the sensitivity of the colorimetric methods could be so increased as to allow the accurate analysis of amounts of many materials as low as one or a few millimicrograms (1 millimicrogram = 0.001 microgram = 0.000,000,001 gram). By 1946 little application had been made of this type of technique in practical research work, but the field of application is so broad in all phases of chemistry, biochemistry and biology that developments along this line were expected to outdo all past efforts toward chemical study of the microscopic world.

Miscellaneous Techniques.—The development of fine manipulative methods for separating and handling minute objects, such as the nuclei of cells, has progressed markedly to supplement the quantitative techniques which constitute the foundation of ultramicrochemistry. Improved microscopic methods using fluorescence from ultra-violet light and improved methods of staining certain constituents of cells and tissues for identification purposes have come into use.

For the first time in history, the ultramicrochemist possesses the tools with which he can carry chemical investigations into the cells, the very seat of life processes of plants and animals, and elucidate their nature. He can elaborate the complete chemistry of a new synthetic element before the amount of it on earth is the size of a small pin head. He can facilitate or make possible all sorts of research investigations which were completely impossible without these extremely delicate techniques. Medicine, agriculture, radiochemistry and biology can now advance in their basic chemical knowledge just as they advanced as a result of the in-

vention of the microscope, except that now it is chemical vision which is magnified, and now can be seen not only what is present but how much and how it is composed.

BIBLIOGRAPHY.—P. L. Kirk, *Annual Review of Biochemistry*, 6, 73 (1937); 9, 593 (1940); D. Glick, *Annual Review of Biochemistry*, 13, 705 (1944). (P. L. K.)

ULTRAMONTANISM, the name given to a certain school of opinion in the Roman Catholic Church (Lat. *ultra,* beyond, *montes,* the mountains). The expression *ultramontane* was originally no more than a term of locality, characterizing the persons so described as living—or derived from—"beyond the mountains"; but from the very beginning we find it used as a party appellation to describe those who looked "beyond the mountains" in order to obtain a lead from Rome, who represented the papal point of view and supported the papal policy. Thus, as early as the 11th century, the partisans of Gregory VII were styled ultramontanes, and from the 15th century onward the same name was given to the opponents of the Gallican movement in France.

It was not until the 19th century that "ultramontane" and "ultramontanism" came into general use as broad designations covering the characteristics of particular personalities, measures and phenomena within the Roman Catholic church. At the present time they are applied to a tendency representing a definite form of Catholicism within that church; and this tendency, in spite of the individual forms it has assumed in different countries, everywhere displays the same essential features and pursues the same ends. It follows, from the very nature of ultramontanism, and from the important position to which it has attained, that the official organs of the church and all the people interested in the continuance of the actual state of affairs deny that it exists at all as an independent tendency. It is indisputably legitimate to speak of ultramontanism as a distinct policy, but it is very difficult to define its essential character.

(i) The first and fundamental characteristic of ultramontanism is its carrying to a logical issue the concentration of all ecclesiastical power in the person of the Roman Pontiff. (*See* PAPACY.) To the *curial system,* so evolved, continually fortifying its position in the domains of theology, ecclesiastical law, and politics, the *episcopal system* stands in opposition. The system admits that the pope represents the unity of the church, and acknowledges his primacy, while at the same time it claims on behalf of the bishops that, in virtue of the divine ordinance, they possess an inalienable right to a share in the government of the church (*see* CHURCH HISTORY; FEBRONIANISM). The struggle between these two systems continued well into the 19th century; and, though episcopalism was not infrequently proscribed by the Curia, it still survived, and until the year 1870 could boast that no oecumenical council had ventured to condemn it. This was done for the first time, in 1870, at the Vatican council (*q.v.*), whose decrees, recognizing the universal episcopate and the infallibility of the pope, marked the triumph of that doctrine by which they had been long anticipated. The Catholic church, in all countries, has become more and more dependent on the Curia: the bishops have lost their autonomous standing, and their position is little more than that of papal delegates, while all important questions are referred to Rome or settled by the nuncios.

(ii) A second peculiarity of ultramontanism is that it claims for the Catholic church the functions of a political power, and asserts that it is the duty of the secular state to carry out its instructions and wishes. Since the conditions of the age no longer allow the pope to depose a temporal sovereign, the practical application of this conception of the relationship between the spiritual and temporal powers has taken other forms, all of which, however, clearly show that the superiority of the church over the state is assumed. This may be seen in the attitude of ultramontanism toward secular law. It assumes that God has conferred on the individual and on society certain rights and competences as inalienable possessions. This "natural law" ranks above all secular law, and all state legislation is binding only in so far as it is in harmony with that law. As to the provisions of this natural law, and the consequences they entail in individual cases, these can be decided only by the church, *i.e.,* in the last resort, by the pope. Thus, even at the present time, the opinion is very clearly expressed in ultramontane quarters that, in the event of the state issuing laws contravening those of nature or of the church, obedience must be refused. The attitude of ultramontanism, for instance, toward the right claimed and exercised by the state to make laws concerning marriage is wholly negative; it recognizes no marriage laws except those of the church, the church alone being regarded as competent to decide what impediments are a bar to marriage, and to exercise jurisdiction over such cases.

(iii) Since ultramontanism cannot hope to realize its political ambitions unless it succeeds in controlling the intellectual and religious life of Catholic Christendom, it naturally attempts to extend its sphere of influence in all directions over culture, science, education, literature and the forms taken by devotion. The development of these efforts may be easily traced from decisions of the congregation of the index and the holy office in Rome. Ultramontanism, too, labours systematically to bring the whole organization of education under ecclesiastical supervision and guidance.

(iv) In the fourth place, ultramontanism is the embodiment of that intolerance toward other creeds which is the logical consequence of the authoritarian claims of the Catholic church. The general presupposition involved is that a man cannot be saved except within the Catholic church. Since, however, on the one hand—in virtue of a theory advanced by Pius IX against the emperor William I of Germany, in a letter which has since become famous—every Christian, whether he will or no, belongs to that church by baptism, and is consequently pledged to obey her, and, on the other hand, since the state lies under the obligation to place the "secular arm" at its disposal whenever one of its members wishes to secede, the most far-reaching consequences result. In the past this principle led to the erection of the Inquisition (*q.v.*) and, even at the present day, there exists in the Curia a special congregation charged with its application. The gradual separation of state and church, a process traceable in its various degrees in all countries of Europe, has resulted in rendering impossible the strict application of a system to which human nature itself has rightly or wrongly, taken exception. As a result of this situation, the Catholic condemnation of heresy—though as stringent as ever in principle—has assumed forms less physically dangerous for the heretic.

(v) Lastly, ultramontanism opposes the nationalization of Catholicism. This peculiarity is connected, though not identical, with the above-mentioned tendency toward the Romanization of the church. Just as in Protestant countries there has often been an amalgamation of evangelical belief with national feeling, so many Catholics desire that Catholicism shall enter into the sphere of their national interests, and that the activities of the Catholic church should rest on a national basis. These aspirations have been proclaimed with especial emphasis in France, in Germany (*Reformkatholizismus*) and in the United States (*Americanism; see* HECKER, ISAAC THOMAS); but they are everywhere met with a blank refusal from the ultramontane side. Ultramontanism fears that any infusion of a national element into ecclesiastical life would entail the eventual separation of the people in question from papal control, and would lead to developments fraught with danger to the supremacy of the papacy.

A MUCH DISPUTED PROBLEM

The relationship of ultramontanism to Catholicism is a much-disputed problem. The ultramontane maintains that there is no justification for distinguishing between the two; but, even within the pale of the Roman church, the identification provokes dissent, and is repudiated by all who are shocked by the effects on the life of the church of an overcentralized political Catholicism. It was on these grounds that in Jan. 1904, it was proposed in the chamber of the Bavarian Reichsrath that the clergy should be deprived of the suffrage. The years between the Treaty of Frankfurt (1871) and the outbreak of World War I witnessed a growing difficulty on the part of Catholic Germans to reconcile ultramontane doctrine with the political and industrial development of united Germany. This was the real background of what is known as the *Kulturkampf* (*see* GERMANY, *History*).

The collapse of Germany after World War I (1914–18) tended, on the whole, to stimulate ultramontanism (*e.g.,* in Bavaria); but the republican elements which combined in 1919 to uphold the constitution of Weimar, proved strong enough to resist the more extreme manifestations of this tendency.

It may be admitted that for all the principal contentions of ultramontanism, analogies may be found in the past history of the Catholic church. Thus, in the middle ages, we find extremely bold pronouncements with respect to the position of the papacy in the universal church; while political Catholicism had its beginnings in antiquity and found very definite expression, for instance, in the bull *Unam sanctam* of Boniface VIII. Again, the attempt to subordinate all intellectual life to ecclesiastical control was a feature of the mediaeval church, and the fundamental attitude of that church toward heresy was fixed during the same period. But since then much has been altered both in the church and her secular environment. The state has become independent of the church, legislates on its own sole authority, and has recognized as falling within its own proper sphere the civilizing agencies and social questions formerly reserved for the church. Again, education, science, art and literature have been secularized; the printing press carries knowledge into every house, the number of illiterates diminishes from year to year in every civilized country, and the clergy are no longer the exclusive propagators of culture, but merely one factor among a hundred others.

The origin of modern ultramontanism is preceded and conditioned

by the collapse of Catholicism in the period of the French Revolution. Pius VI and Pius VII were expelled from Rome, deprived of the papal states, and banished to France. In that country the church almost completely lost her possessions; in Germany they were at least considerably curtailed; in both the hierarchical organization was shattered, while the Catholic laity surveyed the catastrophe in complete passivity. But from this severe fall the church recovered with comparative readiness, and the upward movement is contemporaneous with the rise of ultramontanism. The birth of that system, however, cannot be fixed as a definite event by the day and the hour; nor was it created by any single personality. Rather it was the product of the first post-revolutionary generation. Neither is it merely fortuitous that the reaction proceeded from France itself. For in no other country had hostility to religion attained such a pitch or assumed such grotesque forms; and consequently in no other country did the yearning for religion manifest itself so unequivocally, when experience had demonstrated the necessity of a return to law and order. And in the other states of Europe there existed, more or less, a similar desire for peace and an equal dread of a fresh outbreak of revolutionary violence. In contrast to the struggle for an ideal freedom, which was at first hailed with tempestuous delight only to reveal itself as a dangerous tyranny, men became conscious of the need for a firmly established authority in the reconstruction of society. At the same time, the repression of idealism and sentiment during the period of "illumination" was amply revenged, and the barren age of reason gave place to Romanticism. These tendencies in contemporary opinion favoured the renovation of the Catholic church.

The papacy signalized its reinstation by restoring the Society of Jesus (1814) and re-establishing the index. In Germany ultramontanism had to contend with great difficulties; for here ecclesiastical affairs were not in so desperate a case that the most drastic remedies possessed the most powerful attraction; while, in addition, the clergy were unwilling to renounce all scientific work. The result was that a series of struggles took place between the old Catholicism and the new ultramontanism. But even here ultramontanism gained ground and derived inestimable assistance from the blunders of government after government. The growth of Jesuitical influence at Rome—more especially after the return of Pius IX from exile—implied a more definite protection of ultramontanism by the papacy. The proclamation of the dogma of the Immaculate Conception in 1854 was more than the decision of an old and vexed theological problem; it was an act of conformity with a pietistic type especially represented by the Jesuits. The Syllabus of 1864, however, carried with it a recognition of the ultramontane condemnation of some aspects of modern culture (*see* Pius IX). Finally, in the Vatican council, the Jesuits saw another of their favourite theories—that of papal infallibility—elevated to the status of a dogma of the church (*see* Vatican Council and Infallibility).

ULTRASONICS IN MEDICINE. The study of ultrasonic energy as a separate science began in the early 1920s, when high-frequency acoustic vibrations were first employed for underwater communication (this led to the development of Sonar, or sound navigation and ranging, during World War II). In the following decades, several thousand articles on various applications of ultrasonic energy were published, and many articles were written concerning the medical applications of ultrasonic energy.

Commonly these high-frequency sound waves or ultrasonic vibrations are produced by using a piezoelectric crystal. Certain crystals such as quartz will become electrically charged on opposite surfaces when they are subjected to mechanical pressure. This property is called the piezoelectric effect. The reverse effect also occurs, and the crystal will undergo mechanical vibration when opposite sides are subjected to an alternating electric field. It is comparatively easy to construct a piezoelectric transducer which converts electrical oscillations into mechanical vibrations which, in turn, produce sound waves. Such vibrations can be transmitted through a "sound head" to the surface of the body which is to be treated. The term ultrasonic (beyond sound) is self-defining. The acoustic spectrum is described as being divided into infrasonic, sonic and ultrasonic regions. The terms ultrasonics and supersonics have been used interchangeably. Aeronautic engineers adopted the term supersonics to denote velocities greater than those of sound. Medical investigators adopted the term ultrasonics to indicate frequencies higher than those audible to the human ear. Unlike electromagnetic waves, sound waves require a material medium for their propagation. The mechanical forces accompanying pressure alternations and cavitations caused by ultrasonic energy play the major role in causing biologic effects. In addition to these mechanical effects are also thermal effects which are due largely to the absorption of the sound energy. Ultrasonic energy also accelerates many chemical processes, particularly oxidative processes. If one observes living cells under the microscope during ultrasonic irradiation, one may see such phenomena as whirling of the protoplasm, appendages being sheared off, filaments of spirogyra torn to pieces, laking of red blood corpuscles and paramecia rendered immobile and later torn open.

The mechanical and thermal effects of ultrasonic energy may cause either mechanical or thermal death of animals. The explosive violence with which cavitations occur may bring about the dissociation of molecules, and the heat produced by ultrasonic energy may reach levels which will destroy life.

When it is applied in large dosage, ultrasonic energy is a dangerous agent. Nevertheless, agents which are harmful in large doses may be of therapeutic and diagnostic value in smaller appropriate doses. This proved to be the case with regard to ultrasonic energy.

Ultrasonotherapy is a term which indicates the use of ultrasonic energy in medical therapy, and medical scientists in the 1950s were just beginning to investigate the therapeutic possibilities of this agent. Ultrasonoscopy, the employment of ultrasonic energy diagnostically, gave promise of proving valuable. The employment of ultrasonic waves for detecting flaws in metals was well established by mid-century. Similarly such detectors were being employed in medicine for disclosure of certain lesions in the human being. A device to aid in medical diagnosis operates on the same principle as does the reflectoscope which sends pulsed ultrasonic waves into a medium and picks up their reflections from the opposite surface or from any irregularities that lie in their path. This principle was employed in medicine to detect the presence of gallstones and foreign bodies as well as in measuring the thickness of the intestinal wall, in detecting various abnormal growths and in measuring the size of the ventricles of the brain (sonography).

The bactericidal and virucidal effects of ultrasonic energy had been demonstrated. Destruction of luminous bacteria by ultrasonic energy had been reported, and it had been shown that some bacteria are less resistant than others to the action of ultrasonic energy.

Early studies had been made on the employment of ultrasonic diathermy with the thought that it might produce valuable selective heating effects in various tissues of the human body. Ultrasonic diathermy will heat bone cortex and bone marrow in living animals to higher levels of temperature than can be achieved by any other similar procedure. Also ultrasonic radiation will heat nerve tissue selectively, raising the temperature of nerves to higher levels than that of surrounding tissues. Although the employment of ultrasonic energy in diagnosis and in therapy would seem to have considerable promise, its exact sphere of usefulness had not yet been fully determined at mid-century, and it should be employed only in the hands of especially well-trained and highly qualified experts.

See E. C. Gregg, Jr., "Ultrasonics: Biologic Effects," *New Medical Physics*, vol. 2, pp. 1132–38 (Chicago, 1950); Council of Physical Medicine and Rehabilitation, "Present Status of Use of Ultrasonic Energy in Physical Medicine," *J.A.M.A.*, 148:646–651 (Feb. 23, 1952).

ULTRA-VIOLET RAY: *see* Light and Radiation in Relation to Health.

ULUNDI (Zulu for "high place"), a site in the Zululand region of Natal, U. of S.Af., lies about 3 mi. N. of the White Mfolosi river, between Melmoth and Nongoma, in the heart of the magisterial district of Mahlabatini. Shaka, Dingaan, Panda and Cetywayo successively built kraals in this area. The basin on the south side of the Mfolosi is the cradle of the Zulu race. There, scattered on various European farms, are the graves of the royal house from Zulu to Sensagakona. In 1927 the farm "Moordplaats," on which stand the grave of Zulu and the site of Dingaan's Mgungundlovu kraal, was placed under the care of the Historical Monuments commission. Cetywayo built the kraal at Ulundi immediately after his accession in 1873. On the plain about a mile

from Ulundi, before the Nodwengu kraal whence is derived the Zulu name for the battle, Lord Chelmsford won his decisive victory over Cetywayo's impis on July 4, 1879. Cetywayo fled but was hunted down and captured. On his restoration (Jan. 1883), Cetywayo rebuilt Ulundi, but it was attacked by his rival Zibebu (Usibepu), who burned more than 1,000 huts and killed 59 chiefs and indunas. Cetywayo died a refugee in the magistracy of Eshowe (1884) and was buried near the kraal of Lukungu, induna of Siganandа. After this second destruction Ulundi ceased to be a rallying point. (*See* ZULULAND.) (W. A. ML.)

ULVERSTON, a market town and urban district in the Morecambe and Lonsdale parliamentary division, in the Furness district of Lancashire, just south of the Lake district, Eng., 9 mi. N.E. of Barrow-in-Furness and 37 mi. N.W. of Lancaster by road. Pop. (1951) 10,076. Area 5 sq.mi. Ulverston occurs in Domesday Book, where Vlureston is named as a manor. Early in the 12th century the manor passed to Stephen, count of Boulogne, who gave it to Furness abbey. In 1196 the abbot granted the vill of Ulverstone with the inhabitants to Gilbert Fitz-Reinfred, who granted it a charter and made it a free borough. The lordship became divided. One part passed to the Harringtons and finally to Henry Grey, duke of Suffolk, on whose attainder in 1553 it was forfeited to the crown; the other, returned to the abbey at the Dissolution, was surrendered to the crown. Early in the 17th century the crown alienated the manor, which descended to the family of Buccleuch. In 1280 Roger de Lancaster obtained a charter from Edward I for a weekly market and an annual fair. The council maintains the markets and the fairs are still held annually at Whitsuntide and Martinmas. The church of St. Mary, founded in 1111, retains the original (Transitional) south door, but is mainly Perpendicular in style with an altar-tomb of 1588. Swarthmoor hall, former home of George Fox and a centre of the Quaker movement, is in the care of the Society of Friends. The lighthouse monument on Hoad hill is to the memory of Sir John Barrow, the explorer, author and secretary to the admiralty, who was born in the parish. Conishead priory, 2 mi. S.E., a mansion on the site of a priory founded in the reign of Henry II, is a convalescent home for mineworkers. Ulverston's former iron and steel works and the chemical and paper works have disappeared and the principal industries now include the manufacture of antibiotics, electrical accessories, leather tanning, light engineering and clothing.

ULYSSES: *see* ODYSSEUS.

UMBALLA or AMBALA, a city and district of India, in Punjab. The city is 3 mi. E. of the Ghaggar river, 902 ft. above the sea. Pop. (1951) 52,685. It has a station on the North-Western railway, with a branch line to Kalka at the foot of the hills (39 mi.), which was continued to Simla in 1903. Umballa has a large military cantonment which was first established in 1843. The cantonment, which lies 4 mi. S.E. of the native town, is well laid out with broad roads. Pop. (1951) 94,043.

The DISTRICT OF UMBALLA has an area of 2,019 sq.mi. With one small exception it consists of a level alluvial plain, sloping away gradually from the foot of the Himalayas, and lying between the Jumna and Sutlej rivers. These rivers do not materially affect the district, which has a drainage system consisting of the numerous torrents which pour down from the hills. The principal of the northern streams is the Ghaggar, into which the minor streams empty themselves, some within and some beyond the limits of the district. The Ghaggar is the only perennial stream within the district, but dwindles to a tiny rivulet in the dry season, and disappears altogether beyond the border of the district. In 1951 the population was 943,734. The principal crops are wheat, maize, pulse, millets, rice, cotton and some sugar cane. There are factories for ginning and pressing cotton, and also for grinding wheat. Two opposite corners of the district are watered by the Sirhind and the Western Jumna canals. Umballa is one of the territories previously held by numerous Sikh sirdars, which were attacked by Ranjit Singh. This caused the movement of British troops in 1809 which resulted in the treaty with Ranjit Singh, by which he was required to withdraw his army from the left bank of the Sutlej. In June 1849, after the second Sikh War had brought the Punjab under British rule, the chiefs were deprived of all sovereign power. In March 1869 a grand durbar was held at Umballa on the occasion of the visit of the amir Shere Ali.

UMBEL, in botany, an inflorescence in which the stalks of the flowers all spring from the top of the main stalk, thus usually producing a flat-topped flower head, as in the carrot, parsnip and fennel. (*See* FLOWER.)

UMBELLIFERAE, a plant family of polypetalous dicotyledons belonging to the order Umbelliflorae, which includes also the families Araliaceae (ivy family) and Cornaceae (dogwood family). It contains 200 genera with about 2,700 species, occurring in all parts of the world but chiefly in north temperate regions. It is well represented in the British flora by 35 genera. The plants are annual or perennial herbs, rarely shrubby as sometimes in *Bupleurum,* with generally a very characteristic habit, namely stout erect stems with hollow internodes, alternate pinnately compound exstipulate sheathing leaves and compound umbels of small, generally white, flowers.

An example of an annual is the common fool's parsley, *Aethusa cynapium;* carrot (*Daucus carota*) is a biennial; others are perennial, persisting by means of tubers or rhizomes—such are hogweed (*Heracleum*), *Angelica, Peucedanum* and others. Some genera have a creeping stem as in *Hydrocotyle* (pennywort), a small herb with a creeping filiform stem and, in the British species, entire leaves. *Bupleurum* has simple, entire, often perfoliate leaves. *Azorella,* a large genus in south temperate regions, has a peculiar caespitose habit, forming dense cushions often several feet in diameter and persisting for many years; they resemble those of the Australian *Raoulia* (vegetable sheep). *Eryngium,* represented in Britain by sea holly (*E. maritimum*), is a large genus of rigid, often glaucous herbs with spiny-toothed leaves, which in some South American species with narrow parallel-veined blade and broadly sheathing base recall those of a monocotyledon such as *Agave* or *Bromelia.* In sanicle (*Sanicula*), *Astrantia* and others the leaves are palmately divided.

There is also considerable variety in the development of the umbel, which is usually compound but sometimes simple, as generally in *Hydrocotyle* and *Astrantia,* rarely reduced to a single flower as in species of *Hydrocotyle.* In *Eryngium* the flowers are crowded into dense heads subtended by a whorl of rigid bracts. A terminal flower, distinguished by its form and dark colour, is sometimes present as in carrot (*Daucus*). The presence or absence of bracts and their form when present afford useful diagnostic characters. When present at the base of the primary rays of the umbel they form the involucre, and the involucel when at the base of a partial umbel. In *Astrantia* the simple umbel is enveloped by a large, often coloured, involucre.

The small epigynous flowers are usually hermaphrodite and regular, with parts in fives. The sepals are usually very small, often represented only by teeth on the upper edge of the ovary; the petals are usually obovate or obcordate in shape, often with the tip inflexed; the stamens have long slender filaments bent inward in the bud but ultimately spreading; the two carpels are in the median plane; the two-celled ovary is surmounted by an epigynous glandular disk, which bears the two styles. Each ovary cell contains a single pendulous anatropous ovule with a ventral raphe and a single integument. The flowers are rendered conspicuous by being massed into more or less dense flat-topped inflorescences (umbels). A resemblance to the rayed heads of Compositae is suggested in the frequently larger size of the flowers on the circumference of the umbel which are often sterile and zygomorphic from the larger size of the outer petals. This arrangement allows a large number of flowers to be visited by insects in a short time. The flowers are generally white, sometimes pink or yellow, very rarely blue; they are generally scented, but the whole plant has an odour from the general presence in the tissues of an ethereal oil or resin. The flower is widely open, the petals and stamens radiating from the central disk, on which honey is secreted, and is thus accessible to short-tongued flies. Cross-pollination is necessary, the flowers being generally protandrous. The fruit is very characteristic; a schizocarp which splits down the septum to form two dry one-seeded mericarps which are at first

attached to, or pendulous from, an entire or split central axis or carpophore. The form of the mericarp affords valuable characters for distinguishing genera. On the outer surface of each are generally five ridges (primary ridges), between which are sometimes four secondary ridges; oil cavities, vittae, are often present in the intervening furrows.

The family is classified according to the nature of the flower and fruit. Engler divides the family into three main classes, Hydrocotyloideae, Saniculoideae, Apioideae; the first two with two subfamilies each, the last with eight. The 35 British genera represent 7 of the 12 subfamilies. The following may be mentioned: *Hydrocotyle* (pennywort), *Sanicula* (sanicle), *Conium* (hemlock, *q.v.*), *Smyrnium* (Alexanders), *Apium* (celery, *q.v.*), *Carum* (caraway, *q.v.*), *Myrrhis* (cicely), *Foeniculum* (fennel, *q.v.*), *Aethusa* (fool's parsley, *q.v.*), *Angelica* (*q.v.*), *Pastinaca* (parsnip, *q.v.*), *Heracleum* (hogweed), *Daucus* (carrot).

It is represented in North America by about 70 genera. The more common ones are *Sanicula* (black snakeroot), *Osmorrhiza* (sweet cicely), *Cicuta* (water hemlock), *Sium* (water parsnip), *Thaspium* (meadow parsnip) and *Angelica*.

UMBER: *see* MANGANESE; PAINTS, CHEMISTRY OF.

UMBRELLA, an accessory of dress, is a covering carried in the hand to ward off the rain. The original purpose of the umbrella was that of a sunshade and as such it is traced back to ancient Egypt and Nineveh where it early became a symbol of honour and authority. Ancient Egyptian art depicts the Pharaoh enthroned beneath an umbrella. From the far east also come many interesting accounts and legends of the umbrella. There its use was permitted only to royalty and those of high office.

The Greeks are credited with introducing the umbrella as a sunshade into Europe. Paintings on Greek vases suggest that it was in common use. Roman sunshades were similar to those used by the Greeks. It is believed, however, that the Romans were the first to use the umbrella as a protection against rain.

The use of the umbrella almost disappeared during the middle ages but it appeared again in Italy in the latter half of the 16th century when it was regarded as a symbol of distinction and power by the pope and the clergy. By 1680 the umbrella appeared in France and later in England. The use of the umbrella was general in Italy, France, Britain, Germany and Holland by the 18th century, by which time it was generally employed as protection against the rain. The general construction of umbrellas has changed little through the centuries; however, with the introduction of the steel frame in 1850, the weight was reduced considerably.

Though the umbrella, especially the handle, varied in style with the changes of fashion, it was generally black in colour. In the 20th century women's umbrellas were produced in a variety of colours though men's umbrellas continued to be black.

See Katherine Morris Lester and Bess Viola Oerke, *Accessories of Dress* (Peoria, Ill., 1940); Carolyn G. Bradley, *Western World Costume* (New York, 1954); Millia Davenport, *The Book of Costume* (New York, 1948; London, 1951). (M. B. K.)

UMBRELLA BIRD, the name for a species of the genus *Cephalopterus,* belonging to the American family Cotingidae. The males are black and bear a peculiar umbrellalike crest from which characteristic the name is derived. They also have long, plumed wattles depending from the throat.

UMBRELLA MAGNOLIA or UMBRELLA TREE, common names applied to *Magnolia tripetala,* a deciduous tree of the United States with spreading branches and an open head that grows to 40 ft. and bears one- to two-feet-long pointed oblong to broadly oval leaves that are pale green and are soft-hairy beneath. The flowers are cup shaped, white, ten inches across, unpleasantly scented and appear when the leaves are well developed. It is native from Pennsylvania to Alabama and Arkansas. *See* MAGNOLIA. (J. M. Bl.)

UMBRIA, the name of an ancient and a modern district of Italy.

1. The ancient district was bounded in the period of the Roman supremacy by the Ager Gallicus (in a line with Ravenna) on the north, by Etruria (the Tiber) on the west, by the Sabine territory on the south and by Picenum on the east. The Via Flaminia passed up through it from Ocriculum to Ariminum; along it lay the important towns of Narnia (Narni), Carsulae, Mevania (Bevagna), Forum Flaminii, Nuceria Camellaria (Nocera) and Forum Sempronii; and on the Adriatic coast Fanum Fortunae (Fano) and Pisaurum (Pesaro). To the east lay Interamna (Terni), Spoletium (Spoleto), Fulginium (Foligno—on a branch of the Via Flaminia which left the main road at Narnia and rejoined it at Forum Flaminii) and the important town of Camerinum on the side of the Apennines toward Picenum. On the side toward Etruria lay Ameria (Amelia) and Tuder (Todi), both on the direct road from Rome to Perusia, Iguvium, which occupied a very advantageous position close to the main pass through the Apennines, and Hispellum (Spello). Not far off was Asisium (Assisi), while far to the north in the mountains lay Sarsina. Under the empire it formed the sixth region of Italy.

The name Umbria is derived from the Umbri, one of the chief constituent stocks of the Italian nation. The origin and ethnic affinities of the Umbrians are still, like their geographical location in early times (1200–1000 B.C.), unknown, but their language proves them to have been an Aryan people closely allied with the Oscans and in a remoter degree with the Latins.

The process by which the Umbrians were deprived of their traditional predominance in upper and central Italy and restricted to their confines of historic times cannot be traced in detail. Their easternmost territory in the region of Ancona was perhaps wrested from them by the Picenes, a branch of the Sabine stock; and it is probable that they were partly displaced in the valley of the Po by the Gaulish tribes which began to pour across the Alps from about 500 B.C. But their chief enemies were undoubtedly the Etruscans (*q.v.*), who eventually drove them into that upland tract athwart the Apennines to which the name of Umbria belonged in historical times without eradicating the Umbrian element of population in the conquered districts. In Etruria proper the persistence of the Umbrian stock is indicated by the survival of numerous Umbrian place names, and by the record of Umbrian soldiers taking part in Etruscan enterprises; *e.g.,* the attack on Cumae in 524 B.C. Indeed it is not unlikely that the bulk of the population in Etruria continued to be of Umbrian origin, and that the Romanization of this country was facilitated by the partial absorption of the Etruscan conquerors into the Umbrian multitude.

Against the Romans the Umbrians never fought any wars of importance. After the downfall of the Etruscan power they made a belated attempt to aid their Samnite kinsmen in their decisive struggle against Rome (308 B.C.); but their communications with Samnium were impeded by the foundation of a Roman fortress at Narnia (298 B.C.), and at the great battle of Sentinum (295 B.C.), which was fought in their own territory, the Umbrians did not lend the Samnites any substantial help. It is perhaps on account of this defection that in 200 B.C. they received from the Romans a portion of the Ager Gallicus reconquered from the Senonian Gauls. They offered no opposition to the construction of the Via Flaminia through the heart of their country, and in the second Punic War withheld all assistance from Hannibal. In the Social War (90–89 B.C.), they joined the rebels tardily and were among the first to make their peace with Rome. Henceforth they no longer played an independent part in Italian history.

The material prosperity of Umbria, in spite of its unfavourable position for commercial intercourse, was relatively great, as a result of the fertility of the numerous small valleys which intersect the Apennine system in this region. The chief products of the soil were olives, vines and spelt; the uplands harboured the choicest boars of Italy. The abundance of inscriptions and the high proportion of recruits furnished to the army attest its continued populousness. Among its most famous natives were the poets Plautus (b. at Sarsina) and Propertius (b. at Assisi).

The Umbrians in addition to the city (*tota*) had a larger territorial division in the *tribus* (*trifu,* acc.) as is gathered from Livy (xxxi, 2). Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits. There is conclusive proof of strong Etruscan influences in Umbria, and their alphabet is undoubtedly of

Chalcid-Etruscan origin, while the language, which is known from one or two inscriptions from Fulginium and Tuder, and from the so-called *Iguvine Tables*, the earliest parts of which may go back to the 5th cent. B.C. (*see* IGUVIUM), is a dialect which sprang from the Oscan, but is marked by some phonetic changes. Etruria also taught the towns near it (*e.g.*, Tuder and Iguvium) the art of minting, for they alone had a coinage. The Umbrians counted their day from noon to noon. But whether they borrowed this likewise from the Etruscans is not known. In their measuring of land they employed the *vorsus*, a measure common to them and the Oscans, $3\frac{1}{3}$ of which went to the Roman *jugerum*.

2. The modern territorial division is situated in the middle of the peninsula, between Tuscany and the Marches on the north and east, and Lazio (Latium) and the Abruzzi on the south and west, and comprising the two provinces of Perugia and Terni, with an area of 3,267 sq.mi.; pop. (1951) 803,918. Umbria and the provinces of Ancona and Pesaro and Urbino taken together form an area slightly more extensive than that of the sixth region of Augustus. The surface is mountainous, but affords good pasture, and there are numerous fertile valleys. Many treasures of art and architecture are preserved, and Umbria is in this respect one of the most interesting regions of Italy. (*See* PERUGIA.) Modern Umbria formed down to 1860 a part of the states of the church.

Three main lines of railway run through the territory. One from Florence to Rome skirts the borders of the province on the west, running north and south. Another Rome-Florence line bisects the territory north and south, while the Rome-Ancona runs across the province from northeast to southwest. The cross communication is given by three branch lines. In the north a narrow gauge line from Arezzo to Fossato passes through Gubbio. Perugia, the capital of the province, stands on the line from Terontola to Foligno, while on the extreme south a line passing through Rieti and Aquila, and ultimately reaching Sulmona, starts from Terni on the Rome-Ancona line. There is also an electric railway from Terni via Perugia to Umbertide, on the line between Arezzo and Fossato.

The great steelworks of Terni (*q.v.*), the chloride factory at Nera Montoro near Narni, the chemical manure works at Narni, Foligno and Assisi, the wool and jute works of Terni and Foligno, the cotton spinnery of Spoleto may all be mentioned, while the hydroelectric plants of Umbria, which are concentrated at Terni, are of great importance, and are able to help those of Lazio and Tuscany. (T. A.)

UMBRIAN LANGUAGE. The dialect in which the *Iguvine Tables* (*see* IGUVIUM) are written is usually known as Umbrian, as it is the only monument we possess of any length of the tongue spoken in the Umbrian district before it was Latinized. The language is that of a certain limited area, which cannot yet be shown to have extended very far beyond the eastern half of the Tiber valley (from Interamna Nahartium to Urvinum Mataurense).

Umbrian has diverged from Oscan in the following matters:

(1) The palatalization of *k* and *g* before a following *i* or *e*, or consonant *i* as in *tiçit* (i.e., *diçit*) = Lat. *decet; muieto* past part. passive (pronounced as though the *i* were an English or French *j*) beside Umb. imperative *mugatu*, Lat. *mugire*.

(2) The loss of final *-d*, *e.g.*, in the abl. sing. fem. Umb. *tōtā* = Osc. *toutād*.

(3) The change of *d* between vowels to a sound akin to *r*, written by a special symbol 𐌓 (*ḍ*) in Umbrian alphabet and by RS in Latin alphabet, e.g., *teḍa*, in Umbrian alphabet = *dirsa* in Latin alphabet, "let him give," exactly equivalent to Paelignian *dida*.

(4) The change of *-s-* to *-r-* between vowels as in *erom*, "esse" = Osc. *ezum*, and the gen. plur. fem. ending in *-aru* = Lat. *-arum*, Osc. *-azum*.

To this there are exceptions, *e.g.*, *asa* = Lat. *ara*, which are generally regarded as mere archaisms. Unfortunately the majority of them are in words of whose origin and meaning very little is known, so that (for all we can tell) in many the *-s-* may represent *-ss-* or *-ps-* as in *osatu* = Lat. *operato, cf.* Osc. *opsaom*.

(5) The change of final *-ns* to *-f* as in the acc. plur. masc. *vitluf* = Lat. *vitulōs*.

(6) In the latest stage of the dialect the change of final *-s* to *-r*, as in abl. plur. *arver, arviis, i.e.*, "arvorum frugibus."

(7) The decay of all diphthongs.

(8) The change of initial *l* to *v*, as in *vutu* = Lat. *lavito*.

Save for the consequences of these phonetic changes, Umbrian morphology and syntax exhibit no divergence from Oscan that need be mentioned here, save perhaps two peculiar perfect-formations with *-l-* and *-nçi-*; as in *ampelust*, fut. perf. "impenderit," *combifiançiust*, "nuntiaverit" (or the like).

UNAMUNO, MIGUEL DE (1864–1936), Spanish scholar and man of letters, was born at Bilbao on Sept. 29, 1864. He was educated in Madrid, receiving a doctor's degree in philosophy and letters, and in 1892 was appointed to the chair of Greek language and literature at Salamanca university. In 1900 he became rector of the university. He was always vitally interested in practical affairs and later in a campaign by means of newspaper articles and addresses against governmental corruption and abuses he was so outspoken that he was removed from the rectorship of the university. The coup d'état of Primo de Rivera in 1923, which established a military directorate, aroused him to such vehement denunciation that in Feb. 1924, he was exiled to one of the more remote of the Canary Islands. The sentence aroused much criticism and the government granted amnesty in July, 1924, but Unamuno refused to return to Spain and took up his residence in Paris. In letters Unamuno was a man of wide culture and of great influence in Spanish-speaking countries. In his poems there is vigorous thought and lofty passion which strains at the bonds of rhyme, while his blank verse is weighted with mysticism. There are many excellent sonnets in the collection *Rosario de Sonetos liricos* (1911). His most remarkable poem was *El Cristo de Velazquez* (1920), a long series of mystic meditations, which is often compared by critics to the work of William Blake. His novels are made impressive by their philosophical quality. Superfluous details and descriptive writing are suppressed and the stage is stripped for the interaction of passions and ideas. *Niebla* (1914), *Abel Sanchez* (1917), *La Tia Tula* (1921) and *Tres Novelas Ejemplares* (1921) are all important, but his masterpiece is generally acceded to be *Del Sentimiento Tragico de la Vida* (1913; trans. into English, 1921). Much of his thought, as well as more colourful descriptive writing, is to be found in the *Ensayos* (7 vol., 1916–19), while warmth of feeling for the people and countryside of Spain is shown in *De mi pais* (1903); *Por tierras de Portugal y de España* (1911) and *Andanzas y Visiones* (1922). In the *Vida de Don Quijote y Sancho* (1914; trans. into Eng. 1927) he preached the cult of quixotism as an ideal.

A number of selections and extracts from his essays are translated in *Essays and Soliloquies* (1925); other translations are *The Agony of Christianity* (1928) and the novel *Mist* (1929).

UNAO, a town and district of India, in the Lucknow division, Uttar Pradesh. The town is 10 mi. N.E. of Kanpur. Pop. (1951) 25,240.

The DISTRICT OF UNAO has an area of 1,762 sq.mi. It consists of a flat alluvial plain, lying north of the Ganges. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren *usar*, the whole being intersected by small streams used for irrigation. The Ganges is the only navigable river in the district, while the Sai forms its northeastern boundary. Pop. (1951) 1,067,055.

UNCERTAINTY PRINCIPLE, THE. This principle, which was formulated by Werner Heisenberg (in 1927), and which plays a fundamental role in quantum mechanics (*q.v.*) states that it is impossible to specify or determine simultaneously both the position and velocity of a particle as accurately as is wished. It is, to be sure, possible to fix either of these quantities as precisely as desired, but only at a price, for the greater the precision in one, the greater the inevitable lack of definiteness in the other. A

more exact formulation is as follows: there is no way in which quantum-mechanical language permits us to say that a co-ordinate x and its conjugate momentum p_x simultaneously have values x' and p'_x with arbitrarily small uncertainty. Instead, if Δx and Δp_x denote the uncertainty in x and p_x respectively, there exists the inequality

$$\Delta x \Delta p_x \geqq \frac{h}{4\pi} \qquad (1)$$

where h is Planck's constant 6.62×10^{-27} ergs×sec. It is to be emphasized that the restrictions imposed by the uncertainty principle apply only to a pair of dynamical variables which are canonically conjugate. There is no limit in principle to the precision with which values can be assigned to a co-ordinate and a momentum conjugate to another independent co-ordinate, as, for example, the x component of position and the y component of momentum.

Because h is so small, the indeterminism caused by the uncertainty principle is of no consequence in ordinary experience. For instance, the resulting error in the position or velocity of a rifle bullet would be completely inconsequential even for the most refined ballistic calculation. On the other hand, the Heisenberg uncertainty principle is of great interest and importance in the interpretation of atomic experiments, and has startling philosophical implications.

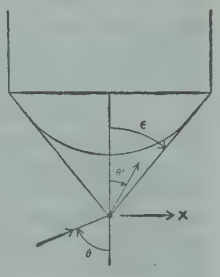
For discussion of the place of the uncertainty principle in the general scheme of things in quantum mechanics *see* QUANTUM MECHANICS: *Statistical Significance.* A quantitative definition is given there of the uncertainty in terms of root mean square deviation, as well as an outline of how the uncertainty principle is derived from the basic equations of wave mechanics, of which it is a necessary consequence.

A standard illustration of the uncertainty principle is furnished by the resolving power of a microscope, which shall be taken as an example.

Let the particle be at such a distance that the cone of rays scattered by the particle and entering the lens of the microscope have an angular opening ϵ, as shown in the figure. It is shown in optics that the resolving power of the instrument is

$$\Delta x = \frac{\lambda}{\text{sine } \epsilon} \qquad (2)$$

where λ is the wave length. In order for the particle to be observed it must scatter at least one quantum of light into the microscope. (If more than one quantum is scattered, the particle will receive extra recoil kicks, and the uncertainty will be even greater than with the estimate.) The theory of the Compton Effect (*q.v.*) and related subjects shows that a light quantum of frequency ν is endowed with a momentum $h\nu/c$, where c is the velocity of light. Consider for simplicity the case where the initial and scattered quanta fall in the same plane as the axis of the microscope, and make angles θ, θ' with the latter, as shown in the figure. Since momentum is conserved in the interaction between the particle and the light quantum, the x component of momentum imparted to the particle is $(\text{sine } \theta - \text{sine } \theta')\frac{h\nu}{c}$ (Here the Compton change of frequency on scattering has been neglected, but this is a second order effect.) As θ' is comprised within the limits $\pm\epsilon$ in order to enter the microscope, the x component of momentum imparted to the particle may be anywhere between



$$(\text{sine } \theta - \text{sine } \epsilon)\frac{h\nu}{c} \text{ and } (\text{sine } \theta + \text{sine } \epsilon)\frac{h\nu}{c}$$

Hence the observation inherently introduces an uncertainty in the momentum of the particle amounting to $\Delta p_x = 2 \text{ sine } \epsilon \cdot \frac{h\nu}{c}$. Combining this result with (1) and remembering that $\lambda = \frac{c}{\nu}$, it is seen that $\Delta p_x \Delta x = 2h$. The fact that ϵ does not appear in this result illustrates the futility of trying to defeat the uncertainty principle with any choice of aperture.

Too much significance should not be attached to the fact that the error is apparently 8π times the minimum allowed by (1), for the estimate (2) of resolving power is accurate only to order of magnitude.

In classical mechanics, if the initial position and velocity are known, together with the forces acting, then a particle's path can be computed for all future time. On the other hand, the uncertainty principle prevents specification of the initial conditions in quantum mechanics, and as a result the future of a particle cannot be definitely predicted. Because of this the law of cause and effect ceases to apply, though the ambiguity is, of course, important only on the atomic scale. Instead the future of a particle can only be statistically predicted in quantum mechanics, but the type of information supplied is just that needed to describe actual experiments. For instance, in the theory of the scattering of alpha particles, quantum mechanics gives directly the formula for the distribution-in-angle of the scattered particles, without correlating a particular scattering angle with a particular distance of closest approach to a scattering centre. Such a correlation is involved in classical theory, but it is necessary to integrate over all distances of approach, and the latter are supernumerary quantities not capable of being observed in the experiment; hence it is unimportant that they are uncertain in the quantum-mechanical interpretation. In fact, it must be regarded as an element of strength in quantum mechanics that the statistics governing the distribution of distances of approach is self-contained in the formalism, and not introduced as an additional hypothesis as in the classical treatment.

It is to be emphasized that in making observations on a system, it is necessary to exchange energy and momentum with it. This exchange of necessity spoils the original properties of the system. The resulting lack of precision with which these properties can be measured is the crux of the uncertainty principle. In the microscope example, for instance, the momentum of the particle was rendered uncertain by the impact with the light quantum by which it was being observed.

The fact that there are intrinsic limits to the precision of experimentation obviously has profound philosophical significance. In particular, metaphysicians can argue whether nature inherently lacks determinism, or is instead completely deterministic. With the latter view, the ambiguity involved in the uncertainty principle, or the apparent breakdown of the law of cause and effect is to be considered as arising only by virtue of the "spoiling" by the experimentation. It is in a certain sense a meaningless question which view is correct, as the properties of nature that are inherently incapable of observation have no realistic significance. In this connection it is well to quote a few sentences from an article by P. W. Bridgman in *Harper's Magazine,* vol. 158, pp. 443–451 (1929):

> The immediate effect [of the uncertainty principle] will be to let loose a veritable intellectual spree of licentious and debauched thinking. This will come from the refusal to take at its true value the statement that it is meaningless to penetrate much deeper than the electron, and will have the thesis that there *is really* a domain beyond, only that man with his present limitations is not fitted to enter this domain. . . . The existence of such a domain will be made the basis of an orgy of rationalizing. It will be made the substance of the soul . . . the principle of vital processes will have its seat here; and it will be the medium of telepathic communication. One group will find in the failure of the physical law of cause and effect the solution of the age-old problem of the freedom of the will, and, on the other hand, the aetheist will find the justification of his contention that chance rules the universe.

The safest conclusion is perhaps that man should remain humble in the face of nature since there are inherent limitations to the precision with which he can observe the latter.

See W. Heisenberg, *The Physical Principles of the Quantum Theory* (1930). The uncertainty principle was first formulated by Heisenberg in the *Zeitschrift fur Physik,* vol. 43, pp. 172–198 (1927), and somewhat amplified by Niels Bohr in *Nature,* vol. 121, p. 580 (1928). An interesting popular article on the philosophical implications of the

uncertainty principle is that by P. W. Bridgman in *Harper's Magazine*, vol. 158, pp. 443–451 (1929). (J. H. V. V.)

UNCLE SAM, the popular name for the United States. The origin of the name is unknown, but is attributed to the initials U.S., placed on property of the government. It came into existence about the time of the outbreak of the War of 1812, spread rapidly, and within a few years was recognized universally.

UNCONSCIOUS. Sigmund Freud, about 1885, began an era of thought by stating that ideas, feelings and memories outside consciousness may affect a person's behaviour even though he cannot report upon them. William James called this the most important step forward in the time he had been studying psychology.

Just as the activities of all units of an army are not always integrated, so all aspects of the mental processes and behaviour of an individual are not co-ordinated. Some mental systems which affect behaviour unconsciously are independent of and unrecognized by the controlling part of the personality.

Disparate and sometimes conflicting uses of "unconscious" occur in popular and scientific writings. The word has been used synonymously with "inanimate" or "subhuman" to describe whatever is incapable of discriminating or behaving. Individuals have been termed unconscious under many different circumstances —when unresponsive to stimulation because of absentmindedness, day-dreaming, hypnosis, sleep, anaesthesia, etc.; when not discriminating between different stimuli; when acting sheerly on the basis of conditioned responses (*see* below); when not sensing, because one or more factors are preventing adequate stimuli from affecting their nervous systems. A person may also be called unconscious if he is not attending to something; if he lacks insight into the nature of a situation involving him; if he forgets something; if his actions are purely instinctive; if he does not recognize the character of the determinants of his behaviour; if some of his acts are involuntary; if he cannot communicate all he is aware of, by word, gesture, facial expression or other means; if he deliberately ignores facts he knows; or if he makes discriminations but is unaware that he does.

The actions, ideas, emotions, needs or drives of a person are also often called unconscious in many of the above meanings, as well as in another sense—not mental. Various theoretical schools deny that unconscious processes exist, on the grounds that consciousness and mind are equivalent, that what is unconscious is therefore not mental, and that hence the concept of unconscious mental processes is self-contradictory. Freud contended that this apparent paradox arises from misunderstanding the psychoanalytic use of "unconscious," which refers to processes that (1) are dynamically repressed away from awareness, the organ of perception; (2) can be brought to awareness only by special techniques like hypnosis and psychoanalysis; and (3) are not controllable voluntarily.

The numerous uses of the word "unconscious" reflect great theoretical disagreements, and sometimes the same process is conscious in one sense and unconscious in another. For example, after a bell has been sounded routinely one minute before repeated feedings, the salivation that normally occurs upon presentation of food can eventually be elicited by the bell—a conditioned response. Psychologists who do not accept introspective reports as valid consider that behaviour indicating discrimination between the presence and absence of a stimulus is evidence of consciousness. Hence a conditioned response is such evidence—a sign, in the example, of consciousness of the bell. Other psychologists do not agree that mental processes are merely neural function evidenced by discriminatory behaviour, believing they also involve awareness of this discrimination. Some of the latter group hold that this consciousness is associated with every mental process, and since conditioned responses are often given a purely neurophysiological explanation, they are not mental—unconscious.

Various schools explain how it is determined which mental processes are conscious and which unconscious by using one or both of two concepts—the economy principle and the pleasure principle. The economy principle is that ordinarily one, or at most a few, thoughts or acts are attended to at a time. The organism appears to function most efficiently when it does not dissipate the energy of attention but concentrates this consciousness on a restricted range of activities, allowing the rest to be relatively or completely automatic. Moreover, certain activities, including composing, complex judgments and highly practised muscular acts, are often accomplished best automatically. If unattended processes develop unusual characteristics or threats to the organism's welfare, a guarding mechanism swiftly turns attentive consciousness to them. Along with this change appear expressions indicating surprise, characteristic objective signs of the onset of the new state of consciousness. Presumably this is associated with increasing "neural vigilance," a phrase of Henry Head meaning high-grade physiological efficiency in a part of the nervous system, which he postulated as developing as consciousness turns to the functions of that part.

Subjectively, various levels of unconsciousness merge imperceptibly into one another. The ordinary waking state differs from hypnosis which differs from sleep which differs from deep anaesthesia. Functional levels of the nervous system also exist, each with its own threshold. Stimuli may be strong enough to cross the threshold to one level and affect behaviour, without being capable of reaching the level of highest neural vigilance. Thus, behaviour may be affected and awareness not be. There is a range of intensity of stimulation at which perception and learning occur without awareness.

Freud described how the pleasure principle operates, thrusting painful thoughts and desires into unconsciousness and permitting pleasant ones to remain conscious. He considered painful those which produce shame, guilt or injury to self-esteem. These are repressed into unconsciousness, which psychoanalytic theory sharply delimits from consciousness, recognizing little merging. They are censored and kept from consciousness unless altered into dream symbols, slips of the tongue, jests or some other acceptable guise.

Because dreams seem distorted and for other reasons, unconscious processes are frequently called irrational. Clinical evidence indicates that one class of these is not illogical but shrewdly devoted to fulfilling socially unacceptable, anarchic desires for independence and self-centred pleasure. Other classes are not irrational either, but are determined by subthreshold stimulation, unconscious conditioning or forgotten events. They elicit unaccountable behaviour because they are not available to awareness. Society forces us to explain our acts, so we make them appear to ourselves and our fellows to arise logically from accepted principles of our culture. That this mechanism is called rationalization does not mean unconscious processes are irrational.

(Ja. G. M.)

UNDERGROUND RAILROAD, a term used popularly to designate an organized system existing in the northern states of the United States prior to the Civil War by which slaves were secretly helped by sympathetic northerners and in defiance of the Fugitive Slave laws (*q.v.*), to make their way to Canada, and thus to freedom. The name arose from the exaggerated use of railway terms in reference to the conduct of the system. Levi Coffin and Robert Purvis were the "presidents" of the road. Various routes were known as "lines," stopping places were called "stations," those who aided along the stages of the route were "conductors" and their charges were referred to as "packages" or "freight." The system reached from Kentucky and Virginia across Ohio, and from Maryland across Pennsylvania and New York or New England. The Quakers of Pennsylvania perhaps initiated the system; the best known of them, Thomas Garrett (1789–1871), is said to have helped 2,700 slaves to freedom. One of the most picturesque conductors was Harriet Tubman, a Negro woman called "General" Tubman by John Brown, and "Moses" by her fellow Negroes, who made about a score of trips into the south, bringing out with her perhaps 300 Negroes altogether. Levi Coffin, a native of North Carolina, in 1826 settled at New Garden (now Fountain City), Ohio, where his home was the meeting point of three "lines" from Kentucky. In 1847 he removed to Cincinnati, where he was even more successful in bringing out

slaves.

Estimates of the number of slaves who reached freedom through the system vary from 40,000 to 100,000.

See W. H. Siebert, *The Underground Railroad* (1898), a scholarly study containing maps of routes and bibliography. W. Still, *The Underground Railroad* (1872); R. C. Smedley, *History of the Underground Railroad* (1883); and *Reminiscences of Levi Coffin* (1880) are personal records of participants.

UNDERWOOD, FRANCIS HENRY (1825–1894), U.S. author, was born in Enfield, Mass., on Jan. 12, 1825. He attended Amherst (Mass.) college for a year and then went to Kentucky to study law and teach. He was admitted to the bar in 1847. An original antipathy to slavery was heightened by close observation and hastened his return to Massachusetts in 1850.

After a year of law practice he was appointed clerk of the state senate and two years later became a literary editor for the Boston publishing house of Phillips, Sampson and company. The idea came to him at about this time of starting a magazine in New England, similar to *Harper's* in New York, in which the Free Soil movement could find a voice. He was peculiarly fitted for the task, combining in himself both practical connections in the publishing trade and wide personal associations among the most distinguished writers of his day—Emerson, Lowell, Holmes, Longfellow, Charles Eliot Norton and Whittier. He entered into correspondence with these and other men, securing manuscripts and promises of material, and by 1853 had contracted for publication with J. P. Jewett and company, publishers of *Uncle Tom's Cabin.*

Unfortunately the firm failed before a beginning could be made, and Underwood turned doubtfully to Phillips, Sampson and company, who had once turned down Harriet Stowe's novel for fear of alienating its southern trade. Chiefly through the influence of Mrs. Stowe, they were finally persuaded to publish the *Atlantic Monthly,* so named by Holmes, and the first number was issued in Nov. 1857 with Lowell as editor.

Underwood, assistant to the editor, was responsible for sifting all copy for undesirable material. Two years later the *Atlantic,* already a success, was taken over by Ticknor and Fields, and there Underwood's association with the magazine ended. Recalling early plans of its makers, he wrote in 1882: "The *Atlantic Monthly* was started with the definite purpose of concentrating the efforts of the best writers upon literature and politics under the light of the highest morals."

In 1859 he became clerk of the superior criminal court of Boston, which position he left after seven years to engage in private enterprise. He was twice appointed U.S. consul in Scotland by Pres. Grover Cleveland; in 1866 to Glasgow, and in 1893 to Leith. He wrote a number of books, the best known of which was *Quabbin, the Story of a Small Town* (1893). It is a novel based on life in his own home town of Enfield and was written in Glasgow. His biographies of Longfellow, Lowell and Whittier are notable for their personal recollections. *Cloud-Pictures,* a collection of short stories, appeared in 1872. Other books include a *Hand-Book of English Literature* (1871) and a *Hand-Book of American Literature* (1872).

He died in Edinburgh on Aug. 7, 1894.

UNDERWOOD, OSCAR WILDER (1862–1929), U.S. politician, was born at Louisville, Ky., on May 6, 1862. He studied at the University of Virginia, Charlottesville (1881–84), was admitted to the bar in 1884 and practised law thereafter in Birmingham, Ala.

From 1895 to 1915 he was a member from Alabama of the national house of representatives, and during his last two years chairman of the committee on ways and means. After the Democrats came into power in 1913 he had a large share in framing the tariff bill passed the same year. In 1914 he opposed the Panama Canal Tolls Repeal bill, but supported the resolution authorizing the president to use armed force in Mexico. He was opposed to the woman suffrage amendment to the federal constitution, holding that the question was a state issue. He also opposed the national prohibition amendment. In 1914 he was elected to the U.S. senate, and in 1920 re-elected. In 1919 he favoured the antistrike clause of the Cummins railway bill. A strong supporter of the peace treaty of Versailles, in Dec. 1919 he offered a resolution in the senate providing that the president of the senate should appoint a committee of ten senators to work out some acceptable plan for adopting the peace treaty; but this was blocked by Senator Lodge. In April 1920 he was chosen Democratic leader in the senate. He was a U.S. delegate at the Washington Conference on the Limitation of Armaments, which assembled in Nov. 1921.

At the Democratic national convention held in New York city, June 1924, Senator Underwood was an unsuccessful candidate for the presidential nomination. In 1927 he was made a member of the U.S. delegation to the Pan-American congress. He published *Changing Sands of Party Politics* (1927). He died at Woodlawn, Va., on Jan. 25, 1929.

UNDERWRITING: *see* INSURANCE.

UNDSET, SIGRID (1882–1949), Norwegian writer and Nobel prize winner in literature, was born at Kalundborg, Den., on May 20, 1882. After completing her studies at the Christiania Mercantile college, Mme. Undset entered a city office in 1899 and remained a clerk until 1909. She thus gained an intimate acquaintance with the empty and unenlivened existence of the girls with whom she came into contact, and used her experience in her first literary works, initiated in 1907 by *Fru Marta Oulie.* In 1912 she achieved fame by the great Christiania novel, *Jenny* (Eng. trans., 1920), remarkable for its courageous treatment of the erotic problem.

After revealing in one of her minor works (1919) the religious crisis in her mind which in 1925 caused her to join the Roman Catholic Church, Mme. Undset published *Kristin Lavransdatter* (1920–22), Eng. trans., part i, *The Bridal Wreath* (1923), part ii, *The Mistress of Husaby* (1925), part iii, *The Cross* (1930), a remarkable novel of the 14th century.

Mme. Undset's work shows psychological depth and an ability to appraise the mind and temper of bygone ages. Her work *Olav Audunsson,* a novel of the 13th century (1925), Eng. trans., *The Axe* (1928), has the same qualities. Other works are *In the Wilderness* (1929); *The Burning Bush* (1932); *The Faithful Wife* (1937); and *Men, Women, and Places,* an autobiography (1939). She was awarded the Nobel prize in 1928. She died at Lillehammer, Nor., June 10, 1949.

See J. Bing, *Sigrid Undset* (1924).

UNDULANT FEVER: *see* BRUCELLOSIS.

UNEARNED INCREMENT, in economics, a term frequently applied to that part of the value of land which is due to the growth and development of the community using it, to the construction of buildings, roads, railways, canals, docks, harbours, upon it, or to the working of minerals beneath it. Thus a piece of land in one part of a country, although beautiful or fertile, may be worth very little, while in another part of the same country a piece of land of similar area required for a railway, or by a railway made accessible for residential purposes, may rise in value by a hundredfold or a thousandfold. The gains thus made by some landowners are so obvious and so great that the specific taxation of the unearned increment has been often proposed and in some countries carried into effect (*see* article on LAND TAXES). Among others, John Stuart Mill favoured a progressive tax on land.

Henry George's tax amounted to a proposal to absorb the whole of the surplus value (*see* SINGLE TAX).

UNEMPLOYMENT. The population of a modern industrial nation can be divided for labour market purposes into three groups: those who are actively engaged in producing economic goods and services; those who are able and willing to engage in such activities and, lacking at the moment the opportunity to do so, are looking for work; and those who are not engaged in such activities and have at the moment no intention of doing so.

The first group can be designated as the employed, using that term in its broadest sense to include not only employees receiving a wage or salary, but also all other persons producing for income or profit. The second group are the unemployed, while the third group may be designated as the nonproducers or the nonworkers. The first two groups constitute the labour force of a nation, which

includes those who are actively in the labour market. The total labour force of a nation includes the armed forces as well as the civilian labour force, although for many economic analyses, the figure for the latter is used. In some countries, the numbers in the armed forces are not made known to the general public in any precise terms.

While these three groups seem quite clear and distinct as loosely defined above, in actual practice there are a good many knotty problems in defining the exact limits of each. Thus the employed are those who are engaged in some kind of economic activity for pay, income or profit. The great majority of these are readily identifiable because they are actually at work and are represented on some kind of a payroll. However there are a few areas of uncertainty which have to be taken into account when actual measurements are attempted.

For example, at any one time there may be a considerable number of employed persons on holiday or vacation with pay. It is obvious that such persons are not at the time actually working, yet they are employed, they draw income and they cannot be considered as withdrawn from the labour force entirely. In many statistical tabulations, these persons are listed as "having a job, but not at work." There are a considerable number of groups of workers in this category: the temporarily ill or disabled, employees on strike who may be picketing the establishment but not working in it, and other such groups.

Farmers and farm workers are sometimes marginal in this employed group, as during winter they may be taking care of the farm, or doing maintenance work for board and room, but without current income.

In another group which is difficult to classify are those who work without pay in a family business or on a farm, usually a wife or a child of working age. On the farm a youth may work with his father in the fields without receiving regular pay; in a small shop, the proprietor's wife may alternate in attending customers without pay. Such persons are considered to be in the employed labour force because they are engaged in selling or in producing for sale in the market.

At the other extreme, the group excluded from the labour force also contains some types which are difficult to classify. The counterpart of the unpaid family workers who are counted as employed are the housewives and other members of the family who are homemakers.

This group, mostly women, is not counted in the labour force. There is no question about the usefulness and productive worth of the homemaker's activities. If she were not doing the housework required, it would be necessary to hire a domestic servant. The difference is that the domestic servant is in the labour market working for pay, while members of a family do not ordinarily maintain strict economic relationships with each other. Children often receive allowances, and the homemaker usually spends most of the chief wage earner's money, but these exchanges of funds are not governed by the bargaining which occurs in a paid job.

There are in fact many kinds of volunteer activities carried on by the so-called nonproducing members of society. In social welfare work, in community activities and in education, there are many unpaid people who work as hard and as usefully as those who work for pay. However, where there is no economic evaluation placed on the activity in the form of pay, there exists no basis for including such people in the labour market.

Between these extremes are the unemployed who constitute a small but important class of people. The usual type of unemployment is not hard to describe. The chief wage earner of a family has been working on a job, but, because of a decline in business, he loses his job and with it his income. The best solution for his problem is to find another job with an income attached to it. During the period he is out of a job, he is clearly unemployed.

However, in this group there are many marginal situations in which it is sometimes difficult to decide just what the labour force status of a person is at a particular time. One example is that of the housewife who takes a job in the canning factory during the summer months. She joins the employed labour force when she takes the job, but when the canning season is over and she returns to housework, is she unemployed or has she withdrawn from the labour force? A similar problem arises in connection with the numerous temporary workers who are employed during the Christmas shopping season but laid off in January.

When the laid-off worker is the chief wage earner of the family and actively seeks other work immediately, there is no difficulty in defining him as being unemployed. But a woman who resumes her housework and makes no effort to obtain another paid job has obviously withdrawn from the labour force. The problem is that a person's labour force status sometimes depends upon the worker's intentions, which may not be easy to discern.

Some difficult problems of classification arise in the small, one-industry town in which the plant closes down. In such cases, there may be few other employment opportunities in the district and many of the unemployed do not actively seek work since none is available locally. Under these circumstances, a common-sense definition is usually applied, and such people are considered to be truly unemployed, even though they are presently making no efforts to get jobs.

All these marginal cases are further complicated by the fact that people's activities and intentions vary widely over a period of time. In June of each year, several million high school and college students leave school for the summer and many of them seek paid jobs. In the U.S. and Canada, as well as in some other countries, such young people would be counted as unemployed when they start looking for work. On the other hand, in some countries, a new entrant into the labour force is not considered to be unemployed until he has first held a paid job and thereby demonstrated the capacity of being attached to the labour market. The result is that the unemployment trends for the summer months differ quite markedly in different countries.

There are many examples of people shifting back and forth to and from the labour force. During wartime, many millions of women enter the labour market to replace young men withdrawn for the armed forces. At the end of World War II, some of them remained in the labour force, while many others withdrew and returned to homemaking. From one season of the year to the next, large numbers of people shift their activities and enter and withdraw from the labour force at will.

Some idea of the magnitude of this shift may be obtained from figures published in 1956 in the U.S. by the bureau of the census. During the year 1955 the average civilian labour force was approximately 65,000,000 persons, but the total number who were in the labour force at one time or another during the year amounted to about 75,000,000.

As might be expected, the vast majority of these shifting workers were women. The average number of women in the U.S. labour force during 1955 was about 20,000,000, but the total number of women who were in the labour force at one time or another during the year was nearly 28,000,000. These figures demonstrate that the women of the U.S. constitute a reserve labour supply which becomes available on a short-time basis in seasonal industries, and on a long-term basis during a national emergency.

These borderline cases are cited, not to undermine the validity of labour force statistics, but to emphasize that the figures contain margins of haziness which should be taken into account when using them. The theoretical concepts of the employed, the unemployed and the nonworkers are quite clear, and the bulk of the population definitely falls into one or another of these groups.

METHODS OF MEASURING UNEMPLOYMENT

Prior to World War I, even though unemployment was becoming a growing problem in many industrial countries, there were no satisfactory statistics of unemployment. The earliest data on the subject came from trade-union reports of unemployment existing among their members. Union officials issued periodic statements on the proportion of their membership which was unemployed. Table I shows the average percentage of unemployment among the members of certain trade unions in Great Britain over the period 1881–1926.

These figures were useful, although their significance is limited. In many cases, they were undoubtedly rough approximations made

by local trade-union secretaries. Furthermore, they do not give an indication as to the unemployment situations among the vast numbers of workers who were not members of trade unions.

TABLE I.—*Average Yearly Percentage of Unemployed Among Members of Certain Trade Unions, Great Britain*

Year	Per cent	Year	Per cent	Year	Per cent	Year	Per cent	Year	Per cent
1881	3.5	1891	3.5	1901	3.3	1911	3.0	1921	14.8*
1882	2.3	1892	6.3	1902	4.0	1912	3.2	1922	15.2*

The first governmental approach to the problem of measurement came through statistics of employment, usually in the form of reports from business concerns that showed the number of persons on the payroll from month to month. In the U.S. certain state governments began to collect employment and payroll reports from employers immediately before and after World War I. The bureau of labour statistics in the U.S. department of labour began a systematic collection of such employment statistics in 1915. Since that time this type of reporting has been expanded and extended until it is now a common practice in many countries. These figures are useful in connection with unemployment, not as direct measures of the number of unemployed, but as indicators of the industries and communities where unemployment may be increasing because of declines in employment.

During the 1920s there were no official unemployment estimates in the U.S. In 1926, when the bureau of labour statistics was called upon to make an estimate, the bureau used the employment statistics to derive a measure of the decline in unemployment which had occurred from a previous date. This was the closest approximation that could be obtained at that time to the number of unemployed in that country.

The development of unemployment insurance systems brought about a definite improvement in the methods of measuring unemployment. All workers protected by unemployment insurance laws were required to register at local employment exchanges or

employment offices as a condition of obtaining benefits. Thus the administration of the system brought about a full count of those unemployed workers covered by unemployment insurance. The earliest comprehensive reports of this kind were those in Great Britain, which are shown in Table II.

These figures did not constitute a completely accurate measure of total unemployment in Great Britain, but the coverage of that unemployment insurance system is so comprehensive that the statistics have served as a guide to national policy.

In the U.S. unemployment insurance did not come into existence until the depression of the 1930s. Consequently, the volume of insured unemployment in the U.S. has been known only since 1940. Table III shows the number and percentage of insured unemployed in the United States over the period 1940–55, including the unemployment in the railroad system and the ex-servicemen drawing veterans' unemployment benefits.

The insured unemployed in the U.S. do not constitute as large a proportion of the total unemployed in that country as do the total insured unemployed in Great Britain, where the unemployment insurance system covers a larger proportion of the working population. In years of downward trends in business, such as 1949 or 1954, the insured unemployed in the U.S. make up about three-quarters of the total unemployed, whereas in prosperous years the

proportion drops to as low as one-half.

Of course, these proportions hold good only during short periods of business recession. In a deep depression many of the insured unemployed exhaust their benefit rights and fall into the uninsured class. This happened in Great Britain during the 1920s. It was then considered necessary in that country to devise a system of extended benefits in order to assist the large numbers of workers who had exhausted their unemployment insurance rights before they obtained jobs.

Some efforts have been made to measure unemployment by means of the registrations at employment offices, that is, the total registrations, including those not covered by the unemployment insurance system. Canada, in addition to its other statistics of unemployment, issues a monthly figure on the number registered for work at the employment offices. In the U.S. during the 1930s some attempts were made to obtain measurements of this kind. These figures, while useful for many administrative purposes, are not wholly accurate as measures of unemployment. The insured unemployed are required to register and the count of that group can be accurately made.

However, the uninsured, if convinced that the employment offices could not help them, might fail to register at all; or, even if they do register, they might let their registration lapse while still being unemployed. Then, a moderate number of employed persons, currently dissatisfied with their jobs, register at the employment offices in the hope of obtaining better ones. This group is not unemployed.

Finally, when a registered worker gets a job, he may not report that fact to the employment office, at least in countries such as

Canada and the U.S. where workers do not carry workbooks. In Great Britain, where the unemployed person is required to deposit his workbook at the employment exchange as a condition of obtaining unemployment benefits, his taking of a job is immediately recorded administratively. However, at any one time the employment office registrations in the U.S. and Canada contain the names of a considerable number of workers who are in employment.

The most effective statistical method of measuring the unemployed is the sample population census, which is used in the U.S. and Canada, as well as in a few other countries. When a full population census is taken in a country, it is possible to obtain (on the basis of reports by the people themselves) the employment and unemployment status of the entire working population. In the U.S. the 1930 census was the first decennial census in which this question was asked. Since that time, it has become a regular feature of the population census. While decennial census figures provide useful detailed breakdowns, they become out of date as economic conditions change. Consequently, for obtaining current unemployment information some system had to be devised, which was done by establishing a measurement system based upon a small sample of the nation's population.

In the United States this type of measurement was begun in the late 1930s, primarily for the purpose of determining the number of workers needing jobs under the government's work programs. Until the spring of 1956, a sample of 21,000 families was considered large enough to provide reasonably accurate information for the country as a whole, though with limited details. At that time the sample was enlarged to 35,000 families and the number of local areas represented was increased to 330. Canada later adopted this same system of measuring unemployment. Table IV shows the unemployment figures for the U.S. and Canada based upon this method of measurement.

TABLE IV.—*Unemployment in Continental United States and in Canada, Annual Average, 1940–55*
(in 000s of persons 14 years of age and over)

Year	United States	Canada
1940	8,120	418

The chief limitation in measuring unemployment by means of a sample census is that it is applicable primarily to large countries. The method is an expensive one, since a visit to the family by a census agent is necessary in order to obtain accurate information. If less populous countries could use proportionately small samples, the expense would not be a serious handicap, since it would be reduced proportionately. Unfortunately, such a practice is not statistically possible. A very thin sample of the total number of families in the country is quite feasible for a large nation like the U.S., but in small countries having only a fraction of the U.S. population, the sample would have to be relatively larger. The smaller the country, the larger the proportion of the population that would need to be included in the sample to obtain accurate data.

Therefore, while this method is undoubtedly the best yet devised for obtaining reasonably accurate information on the unemployment situation in a country with a large population, it is not likely to come into general use because of the comparatively high cost to small countries.

CAUSES OF UNEMPLOYMENT

Unemployment is not the result of any one factor. It arises from a wide variety of circumstances, some in the worker himself, some in the individual business concern and some in general economic conditions. However, it is possible to classify the major factors producing unemployment.

Seasonality.—One of the most obvious of the short-run factors is the seasonality of industry and agriculture. Crops are usually planted in the spring and harvested in the summer and early fall, with comparatively little farming activity during the winter months. As a result, there is a heavy seasonal demand for labour in agriculture.

In the U.S. the reports from the bureau of the census show that between the low point of employment in mid-winter and the peak of employment in summer, there is a range of about 2,500,000 workers each year. In the period 1950–55, the average farm employment in February was about 5,500,000 while the average in June was about 8,000,000.

After the season of high employment, the workers are no longer required. They are laid off, and some are considered to be unemployed and have to find other work during the off season. In many cases, however, these seasonal workers withdraw from the labour force entirely at the end of the season. Housewives returning to housework and students returning to school in September generally withdraw from the labour force when the work stops; that is, they shift from employment into nonemployment rather than to unemployment. When they attempt to join the labour force the following spring or summer, they may experience a period of genuine unemployment before they find a job for the next season.

Building and construction activities are another example of high seasonality. In the U.S. the reports of the bureau of labour statistics show that employment in contract construction varies by about 500,000 workers from the low point in midwinter to the high point in midsummer. Among the manufacturing industries there are similar examples in fruit and vegetable canning, logging and lumbering, slaughtering and meat packing and a number of others. In retail trade and in the post offices, there are sharp increases in employment during the Christmas season, with heavy layoffs immediately afterward.

Some individual firms and industries attempt to even out their seasonal variations by producing for inventory or by developing additional products to stabilize production during the year. Many workers who need year-round employment manage to shift jobs during the year. However, in spite of all the efforts which have been made, there is still a considerable amount of seasonal unemployment, even in the most prosperous years.

Industrial and Technological Change.—Unemployment may also arise from a series of factors associated with industrial shifts and economic change. One major factor is the change in consumer demand. When the motorcar became the popular form of transportation, the carriage industry declined. The demand for tractors on the farm has resulted in the growth of the agricultural implement industry, but it has reduced the need for raising draught horses and mules. The consumer demand for television sets has reduced to some extent the demand for radios, although fortunately for the manufacturers and workers concerned, these are generally produced in the same industry.

TABLE V.—*Employment in Selected Nonagricultural Industries in the United States, Annual Average 1939, 1947 and 1955*
(in 000s)

Selected industries	1939	1947	1955
Coal mining	477	505	246
Automobiles	466	776	921
Chemicals and allied products	406	694	813
Textile-mill products	1,232	1,335	1,075
Leather and leather products	383	409	382
Wholesale and retail trade	6,612	9,196	10,728

Source: United States Department of Labor, *Bureau* of Labor Statistics, *Handbook of Labor Statistics* (1950); 1955 figures in *Employment and Earnings* (Feb. 1956).

Table V shows for selected years the volume of employment in certain industries in the U.S. The table shows that while some industries are expanding and therefore hiring more labour, other

industries may be in a long-run decline.

Geographic shifts of industry for one reason or another may leave pockets of unemployment in the declining areas, as was dramatically illustrated in the U.S. where, even in years of peak total employment during the postwar period after World War II, some local areas suffered heavy unemployment because of the decline of industries located there or the shift of some of the industries to other parts of the country.

The bureau of employment security in the U.S. department of labour officially classifies the major areas in the continental United States with reference to the percentage of unemployment in each. In May 1956 there were 20 areas listed as having a substantial labour surplus. Unemployment in these areas generally represented 6% or more of the local labour force. In a few communities unemployment amounted to 12% or more. Table VI shows the classification of 145 major areas in the continental United States in May 1956.

TABLE VI.—*Classification of Major Labour Market Areas in Continental United States According to Relative Adequacy of Labour Supply, May 1956*

Labour supply group	Number of major areas
Total, all groups	145
Group A	0
Group B	44
Group C	81
Group D	14
Group E	3
Group F	3

Note: Generally speaking, the classification groupings indicate a ratio of unemployment to total labour force in the following ranges:

Group A	less than 1.5%
Group B	1.5%— 2.9%
Group C	3.0%— 5.9%
Group D	6.0%— 8.9%
Group E	9.0%—11.9%
Group F	12.0% or more

The extent of unemployment in a particular area is only one of several factors used in determining the appropriate area classification for each locality. Consideration is also given to the area's employment outlook, as reflected by local employer estimates of their manpower requirements; to the significance of essential activities; to the relationship between labour supply and demand; to the seasonal pattern of employment and unemployment fluctuations; and to several other factors.

Areas classified in categories D, E and F under this classification system are regarded as areas of substantial labour surplus or areas of substantial unemployment.

Source: United States Department of Labor, Bureau of Employment Security, *Bimonthly Summary of Labor Market Developments in Major Areas* (May 1956).

Another related factor that causes unemployment is change in the method of production, that is, changes in technology which reduce the amount of labour required to manufacture a given product. Employers are always engaged in seeking new and cheaper methods of production; new materials, new processes, new machines. The result is the displacement of labour from certain jobs and occupations, accompanied by the creation of new jobs and occupations. Labour displacement brought about by these changes in production methods does not necessarily result in unemployment, because the workers displaced may be absorbed in the new jobs. However, some unemployment may result if the displacement is very large, or if some firms fail to keep up with the technological progress of the industry.

Unemployment resulting from technological change is only temporary, though it may last longer than seasonal unemployment. For example, in nearly all western industrial countries there has been a tremendous gain in productivity (that is, in output of product per man-hour of labour) in the half century from the early 1900s to the early 1950s. Yet, at the end of that great technological advance, most of those countries are experiencing practically full employment. Technological progress creates jobs as well as eliminating them. However, individual workers may suffer loss of jobs and earnings because of their inability to adjust to the change.

Labour Market Imbalance.—There is a continuing volume of unemployment due to a series of factors which are often characterized by such general terms as frictional, transitional, personal or even normal. However, this catchall group of causes can perhaps be best summarized as a short-term imbalance of labour demand and supply (excluding seasonal variations).

Unemployment of this type may be due to factors affecting the business concern and the demand for labour, or in workers themselves and the supply of labour. In a competitive economic system, business concerns are continually failing, while others are starting up. When a concern closes down it necessarily lays off the workers who have been employed. New or expanding firms are at the same time in the market looking for workers. Nevertheless, considerable unemployment may develop from this change-over because the new industries find it difficult to use the experience and skills of the displaced workers.

Thus the closing of a textile mill would result in the layoff of a great many women workers; a large construction project in the community would require many men workers. Unemployment in the one case could not be solved immediately by the employment created in the other.

Some of this short-term unemployment is due to actions or handicaps of the workers themselves. For example, during periods of prosperity and high employment levels there is a heavy volume of labour turnover due to quits, that is, to the voluntary job changing by the workers themselves. Workers dissatisfied with their current jobs often quit in the hope of obtaining better-paying jobs elsewhere. During this transition they may undergo varying periods of unemployment before they succeed in finding other jobs.

New entrants, that is, those previously not in the labour force, flow into the labour market almost continuously. These workers may undergo a period of unemployment before they find a satisfactory job.

A more general factor is the short-term immobility of the workers and their families. Working wives who become unemployed cannot leave their husbands and families to take a job in another community. Young workers cannot readily leave home. Health reasons may limit the kind of work an unemployed man can accept.

There is no need to elaborate further on this general point. There are many reasons why job opportunities and unemployed workers cannot be matched up quickly and completely. Among these are the factors of geography, sex, age, skill, legal restrictions, union rules and many others.

In Great Britain and Canada, efforts have been made to measure the significance of this labour market imbalance by counting the number of job vacancies which exist in all the employing business concerns. However, great caution needs to be exercised in interpreting any such figures as the jobs which are open may not at that time be suitable for the workers who are available. These job opportunities may need to be filled either by new entrants into the labour force or by a shift of workers now employed elsewhere. This shift in turn might vacate a job which could be filled by one of the unemployed.

There are many signs that this problem is growing in importance. One is the aging of the working population. In the 18th century, before the Industrial Revolution, economic change proceeded at a slow pace. Occupations remained unchanged for many decades. At the same time, life was short, and a comparatively small proportion of the labour force reached the age of 45 years or over. Thus there was a comparatively rapid turnover of the labour force, with the average worker serving perhaps 25 or 30 years at the most.

In the 1950s the situation is very different. On the industrial side, there are many new technological developments, including those which are usually summarized under the heading of automation. These developments presage exceedingly rapid changes in industrial processes and in production methods. Then also, under the improved conditions of health and medical care, the working population has a greater life expectancy.

In the U.S. the estimates of the National Office of Vital Statistics show that, as of 1950, a young man age 20 had a prospect of living until age 69, a period of nearly a half century. The bureau of labour statistics, using its Tables of Working Life, shows that this young worker is likely to be in the labour force until age 63, a total of 43 years. In the coming decades, if present trends continue, both the average life and the average working life are likely to increase further.

The problem is then that older workers are less flexible and adaptable to new jobs and new occupations than young workers. Thus the increasing rapidity of industrial change coupled with the gradual aging of the working population has the effect of

lengthening the time required to readjust displaced workers, especially older ones, thereby enlarging to some extent the pool of unemployed.

Some institutional factors are also operating in this direction. In the period after World War II, in a number of countries and especially in the U.S. and Great Britain, there grew up a large number of private industry pension plans designed to produce retirement benefits for workers when they reached the end of their productive capacity.

These plans tend to lessen labour turnover and thereby produce steady employment for older experienced workers. However, they may also have the effect of limiting the employment opportunities of older workers who are seeking work. Some of this rigidity can be overcome by "vesting," which is the device of permitting a worker, after a certain limited period of service, to acquire pension rights and retain them even though he shifts to another firm or another industry. Also, insured pension plans can be written in terms which will not increase the employer's costs if he hires an older man instead of a younger.

Business Cycles.—Finally, the most serious cause of unemployment is the swing in general business conditions between various stages of prosperity and depression. This factor is of greater significance than all others combined. In the great depression of the 1930s, the volume of unemployment in the U.S. and Germany, both of which were highly industrialized economies which had previously enjoyed high levels of employment in the 1920s, amounted to fully one-third of the total labour force in each country. In Germany this economic disaster was a major factor in the rise of Hitler and naziism. In the U.S. it produced many far-reaching changes in social and economic policies.

The experiences of Great Britain with unemployment after World War I were the stimulus for the theoretical work of John Maynard Keynes, the economist whose theories about the causes of unemployment have profoundly influenced economic thinking since his time.

Theories of Cyclical Unemployment.—Since the Industrial Revolution, economic thinkers have been deeply concerned with the reasons for the periodic and occasional business depressions which have accompanied the development of the modern industrial system of production. Soon after the close of the Napoleonic Wars, analyses of business cycles appeared in economic literature and many theories were evolved. Some thinkers, especially the socialists, postulated that instability was inherent in the economic system and that the only solution was the ownership of the means of production by the government. The presumption was that the government could manage industry in such a way as to prevent unemployment. Karl Marx based his confidence in the further triumphs of socialism on his belief that ever-increasing and ever-deepening business crises (depressions) would eventually bring about the collapse of the capitalistic free enterprise system. Evidence of the continued survival of this type of thinking was found in the official belief of the soviet government that the economic readjustments after World War II would produce a major business depression in the U.S. and other countries of the western world.

More orthodox economic thinkers in the 19th century attributed the depressions to the round-about system of production which is inherent in modern industry, in that the basic cause of the business cycle was the lack of co-ordination in production. A business boom is a period in which many businessmen expand capital development; a depression is a period in which the existing plant and equipment can produce all the goods that consumers are able to demand.

Other economic thinkers looked more to the money and credit problems which lie behind the processes of production. Statistical analysis of the different phases of the cycle showed that a considerable number of financial problems developed as production increased. The theory was that financial stresses eventually brought the boom to an end because prices and credit had become too far out of line with other factors in the economy.

The short but sharp depression in 1920–21 is one example of this type. In the U.S. the expansion of credit had reached the limitations established by law, and the rediscount rate in the federal reserve system was raised to 7%. The result was a swift deflation of commodity prices, stock prices, land values, etc. Much more disastrous was the world-wide deflation of 1929, during which the drop in the world's commodity markets, stock markets and bank assets produced the deepest and longest depression the world had yet seen.

Lord Keynes made an attempt to synthesize from all these ideas a comprehensive theory which would satisfactorily explain the economic factors contributing to the business cycle. His *General Theory of Employment, Interest and Money* (1936) is a landmark in economic theory, and economic thinking since the publication of his great book has been influenced by his ideas.

It is not necessary here to elaborate details of Keynes's theory, but it can be summarized briefly. People either spend or save income. Then businessmen planning to expand their plants and equipment require funds with which to do so. Funds so applied from income or savings are termed investment. The operation of the economic system brings together the investment and the savings.

Keynes pointed out that when investment exceeds savings, there is an expansion of credit which makes up the difference, and this brings about a rise in business activity. On the other hand, if savings exceed investment, there is a loss of purchasing power which produces a business decline. The problem, therefore, becomes one of trying to maintain as even a balance as is practicable in a changing economic system.

REMEDIES FOR UNEMPLOYMENT

In some respects, unemployment is the price of economic progress. In a competitive industrial society, new business concerns are started at the same time that other concerns are closing down. Whole industries are on the upgrade, while other industries are on the downgrade. With many thousands of firms employing millions of workers engaged in a competitive struggle, it is inevitable that some unemployment will always exist, no matter how prosperous a nation may be. Under the pressure of World War II shortages, unemployment in the U.S. seldom fell below 1,000,000 workers, or a little less than 2% of the labour force.

Even in the most prosperous years following World War II, unemployment in the U.S. seldom fell below 1,500,000 workers at any one time. The complete elimination of unemployment would be practically impossible; and if it were to be pursued as a goal, the result would be to limit the growth of the economy and to reduce it to a static state.

Furthermore, some unemployment is the result of the free choice of the workers themselves—a calculated risk, so to speak. A free economy means that workers are free to quit their jobs, either because they have decided to leave the labour force or because they are looking for a better job. In this situation it is not a case of the employer laying off a worker who is clinging to his job, but rather a worker who is exercising his own free enterprise by leaving the employer who may be very eager to keep him.

This aspect of unemployment is shown in the statistics of labour turnover. In times of prosperity and high-level employment, the great majority of separations from jobs occur through the voluntary quit by the worker. At certain times from two-thirds to three-fourths of all separations are on the worker's initiative. In addition, the unemployed worker in good times may exercise a great deal of caution in choosing another job. Unskilled, unpleasant and low-paid jobs may be going begging, while skilled and semi-skilled workers elect to look around for a job in line with their previous experience.

When business turns down and job opportunities are less plentiful, the quit rate declines. It is then that the employer becomes the initiating factor in job separations. When his sales decline, he lays off workers. At those times, the layoff rate becomes the major factor in unemployment.

Also, since job opportunities are not plentiful, an unemployed worker is more likely to remain out of work for much longer periods of time. It is unemployment of this kind which produces social and economic problems.

The earnings from work constitute the main support of the aver-

age family. Any prolonged interruption of those earnings will generally cause destitution. The objective of social policy should be to limit the amount of involuntary unemployment as much as possible. Some methods are discussed below.

Stabilization by the Individual Firm.—Many employers have attempted to limit unemployment by stabilizing the employment in the individual firm. A remarkably high degree of employment stabilization has been achieved by some firms. A classic economic example in the U.S. is the integration of the coal and ice business, which matches winter and summer activities. Concerns engaged in producing Christmas cards, which sell during a very short demand season, have managed to round out the year by taking on other kinds of business. Many firms manufacture to stock during the slack season. When a concern finds itself with a declining product, it is often able to take on a new line which is expanding.

A few employers have devised the system of paying the worker a regular weekly wage, but varying the hours of work in accordance with production needs. Some employers prefer to have their employees work overtime, even at premium rates of pay, when production schedules are heavy, rather than to hire additional workers. When production falls off, they cut back to the standard weekly hours, or even share the work at reduced hours, in order to keep a stable labour force.

Despite all the achievements which have been made by individual concerns in pursuit of stabilized employment, these are only a partial solution of the problem. Many businesses cannot be stabilized. An employer in a declining industry may not find any way to prevent reduced employment. Manufacturing to stock has definite limits.

Unemployment Insurance.—Another suggested solution is the establishment of a system of unemployment insurance which will pay benefits to a worker when he is out of work through no fault of his own. Unemployment insurance is based on the principle that a certain amount of unemployment is inevitable. If it cannot be prevented, at least a worker and his family can be protected. Since the primary problem in unemployment is the loss of income, the provision of benefit payments overcomes some of the worker's difficulties. (For the workings of various systems *see* also UNEMPLOYMENT INSURANCE.)

In many countries, unemployment insurance is financed by contributions from the employed workers, the employers and the government. This type of insurance is based on the theory that unemployment is not the fault of either the employer or the worker, but that it is a natural consequence of the operation of the free enterprise system, the cost of which should be shared by all.

In the U.S., however, a somewhat different system has been developed. The theory in that country is that the employer, within certain limits, can control the amount of unemployment experienced by his workers. Therefore, the total cost of unemployment insurance is borne by employers only, and among them the rates are varied in accordance with the amount of unemployment attributed to their individual firms. The effect of this is to enable some employers to achieve comparatively low rates of contributions, while other employers pay higher rates, each based on his own experience. An additional argument for this system is that the variation of the individual employer rates will exercise some influence in stimulating an employer to stabilize his own employment insofar as it is possible.

Whatever the system of employment insurance, its chief advantage is that it permits the economic system to operate in accordance with competitive economic principles. This means that employers are free to expand or contract, to hire workers or to lay them off. Economic progress can take place at any desired rate. The insurance simply protects the workers and their families against some of the consequences of this progress.

Public Works Programs.—In times of business depression, the initiation by the government of a public works program is generally popular with all. There are several reasons for the popularity of this program. One is that public works are a governmental responsibility, and people look to the government for help when the private economy is not doing well. A second is that government can take a long view, inaugurating and carrying out projects which may not pay off for many years. Third, there is the belief that government construction activities could help counterbalance in some degree the swings of prosperity and depression in the private economy.

This general idea of public works as a partial remedy for unemployment received official sanction in the U.S. in 1923 when the Committee of the President's Conference on Unemployment published a report recommending the expansion of public works in times of business downturn as a countercyclical measure. During the great depression of the 1930s this idea was put into practice. In the U.S., beginning in 1933, an expanded public works program was begun under the Public Works administration. Two years later, the Works Progress administration was established for the specific purpose of providing jobs for the millions of the unemployed by means of special state and local projects, such as parks, schools and public buildings of various kinds. While these WPA projects were not wholly made work, they were definitely selected in such a way as to provide the maximum number of jobs per dollar of expenditure and to be of a character that would not interfere with the regular public works program. The Civilian Conservation corps was established to provide jobs for young men in forest conservation and similar types of activity.

In many countries throughout the world, similar types of programs were instituted, though seldom on a scale comparable with that in the U.S.

The experience of the 1930s led to a re-examination of the part which a public works program can play in the relief of unemployment. The limitations of such a program have been more clearly recognized. In the first place, the volume of public works constitutes only a small proportion of total economic activity. Even in times of great construction activity, the volume of construction constitutes only about 10% of the nation's gross national product. Employment on public works, even during peak periods, amounts to only a few per cent of the labour force.

Furthermore, public works construction has become in recent decades much more mechanized, with the result that it creates fewer direct jobs per dollar of expenditure. Increased mechanization in turn leads to greater skill requirements and to greater specialization of labour in construction. This condition became apparent in the U.S. during the WPA program when projects were held up for lack of the necessary skilled labour, although there were many thousands of unskilled workers available for jobs. As a result, more thought was given after World War II to the idea of establishing long-range public works programs and maintaining stability in these programs rather than attempting to use them to counterbalance changing business conditions.

Monetary Policy.—It has long been recognized by economists that periods of prosperity coincide with expansion of the money supply, while depressions have been accompanied by a contraction in money and credit. By law or custom the supply of paper money and credit instruments has generally been tied to the gold reserve in the central banks or in government vaults.

The gold standard was an automatic regulatory device. If a business boom in a given country went too far, the available supply of paper money reached the upper legal limit and could not be expanded further. In addition, an outflow of gold to other countries often required a contraction of money and credit in the expanding country. In a business downturn, the mechanism operated in reverse and an inflow of gold provided an opportunity for business recovery.

The gold standard in its old form broke down during the depression of the 1930s when all countries ceased redeeming their paper currency in gold on demand. A modified international gold standard has developed since that time, but most governments do not permit gold to operate as an automatic control mechanism, either domestically or internationally.

In the meantime, during the quarter century following 1930, strong support developed for the theory that government agencies and central banks can operate a somewhat flexible monetary policy, designed to regulate in some degree the supply of money and credit for business, without subjecting the economy to the rigid automatic

operation of the old gold standard. The theory is that a central bank, by regulating the reserves required to be kept by commercial banks, or by buying and selling securities in the open market, can govern to some extent the available supply of credit. Since the government in nearly all countries either controls the central bank or has considerable influence on it, this control or influence effect means the operation of a conscious policy of regulating credit with a view to avoiding excessive business booms and subsequent depressions.

The import of this for unemployment is that a smoothing of the business cycle would avoid some of the worst aspects of unemployment.

MAINTENANCE OF ECONOMIC GROWTH AND STABILITY

The experience of prolonged unemployment during the depression of the 1930s, followed by the full employment of World War II, made many people apprehensive about the possibility of severe unemployment during the postwar readjustment. This problem received the attention of the governments of many different countries, but it received special consideration in the U.S. Western European countries had nearly all suffered severe war damage and were faced with the urgent task of restoring prewar production levels as soon as possible.

The U.S., on the other hand, had not suffered any such destruction, and the government in that country considered that the dismantling of the war industries might lead to considerable temporary unemployment. As the result of this concern, in 1946 a law was passed which established a council of economic advisers in the executive branch of the federal government. Among the functions assigned to this council were the preparation of periodic reports to the president of the U.S. and to congress on current economic conditions within the country, and the making of recommendations for the maintenance of high employment conditions. A council of three members was appointed in 1946. Congress, on its part, created a joint committee on the economic report, the function of which was to evaluate for the members of congress the analyses and advice provided by the council of economic advisers. The council issued semiannual and annual reports and became over a period of ten years one of the most influential agencies in the U.S. government. In general the objectives of the council have been to recommend policies to the government, as well as to industry and labour, designed to maintain economic stability while achieving economic growth.

Most countries with free enterprise economic systems have adopted similar policies. While the government agencies are not exactly the same as in the U.S., there does exist in most western countries some agency of government charged with the responsibility of devising policies to assist in the maintenance of full employment.

The significance of these developments for the problem of unemployment is that there now exist, on a scale never before seriously contemplated, government programs for dealing with cyclical unemployment. Furthermore, these programs are supported by public opinion and by government resources sufficiently large to have a marked impact on the private economy. Therefore, the statistics of unemployment, inadequate as they may be, have become one of the key figures for the determination of economic policy.

Up to the mid-1950s this program was apparently successful. Business downturns occurred in 1949 and 1954 in the U.S. Some moderately heavy unemployment existed at times during the postwar period in Belgium, western Germany and Italy. But there was no world-wide postwar depression and no serious prolonged depression in any western country. Nevertheless, questions were raised by economists and others as to whether this was due more to good luck than to good management.

The western world was engaged after World War II in making up wartime shortages and in rebuilding after wartime destruction. Some thinkers questioned whether the western world was yet returned to normal peacetime business conditions and whether, when it was, the various government economic planning agencies would be as successful as they had been.

However, on one point there was no doubt. If ever and whenever a serious business downturn occurred involving heavy unemployment, the governments would not only be deeply concerned, but would be able to set in motion a whole series of policies and programs designed to offset the decline. The prevention of unemployment had definitely become a matter of national policy.

UNEMPLOYMENT INSURANCE. Although the first suggestion for providing financial assistance to persons involuntarily unemployed was made in Switzerland in the late 18th century, the introduction of national systems to provide this assistance came only in the 20th century. Such systems from the very beginning involved workers, employers and governments, singly or in varying degrees of co-operation; some were voluntary while others were compulsory. Unemployment insurance resulted from a shift from the opinion that lumped the unemployed and the unemployable together as the objects of charity to the 20th-century concept that involuntary unemployment is a matter for serious concern in terms of the health of the entire economic system.

This article is concerned primarily with the methods of financing, requirements for eligibility and general aims of the various national systems. For theoretical considerations and earlier attitudes, *see* UNEMPLOYMENT: *Remedies for Unemployment;* POOR LAW; SOCIAL SECURITY. (X.)

UNITED STATES

The first U.S. unemployment insurance law was passed in Wisconsin in 1932. Before that, U.S. experiments with unemployment insurance were limited to plans either initiated by employers or adopted by agreement between labour unions and employers.

The cornerstone of unemployment insurance in the United States was laid by the enactment of the Social Security act in 1935, which imposed a payroll tax on all employers having eight or more employees in "covered" employment. However, 90% of this tax could be offset if the employer paid unemployment insurance taxes under a state law meeting certain general standards. It also provided for federal grants to the states for the total cost of administering unemployment insurance laws if certain general statutory and administrative standards were met. These inducements were strong enough to bring about the enactment of unemployment insurance laws in every state, the District of Columbia, Alaska and Hawaii before July 1937.

Later, in 1938, a special federal system was adopted for the railroad industry. In Sept. 1954 amendments to the federal Unemployment Tax act extended coverage to employers of four or more workers as of Jan. 1, 1956, and a new title of the Social Security act provided benefits to federal civilian employees for unemployment beginning Jan. 1, 1955.

Unemployment insurance protected the regularly employed who became unemployed because of lack of work and were able and willing to accept suitable employment. It provided income as a matter of right in the form of a weekly benefit related to prior wages. This income was intended to cover the workers' nondeferrable expenses without reducing work incentives.

The objective was to provide benefits for a period long enough to tide most workers over spells of unemployment between jobs and help maintain their purchasing power to prevent the spread of secondary unemployment. Funds were accumulated during periods of high-level employment for use when benefit expenditures

increased. Continuous contact with public employment offices facilitated absorption of claimants into employment.

The system involved close co-operation between the federal and state governments. Except for railroad and federal workers and special temporary programs for veterans, there was no national unemployment insurance law. Federal worker benefits, financed by federal funds, were paid by state agencies under their own benefit formulas.

Federal Responsibility.—The Social Security act of 1935 created a Social Security board to administer the various provisions of the act. After June 1939 the board exercised its function under the direction of the administrator of the Federal Security agency. Operational responsibilities were carried on by the bureau of employment security of that agency.

The United States employment service, created by the Wagner-Peyser act of 1933, was transferred by congress from the U.S. department of labour to the Federal Security agency in July 1948, and combined with the unemployment insurance program as the bureau of employment security. In 1949 the bureau was transferred back to the department of labour.

The bureau administered the federal part of both the employment service and unemployment insurance, maintaining direct relations with state administrative agencies through regional offices. Its primary responsibilities were to see that the state laws conformed with requirements of the federal acts and to determine, within the amounts authorized by congress, the amounts to be granted to the individual states for the administration of the state laws. A clearinghouse and service agency, the bureau promoted efficient administrative methods and made studies and recommendations to improve provisions for economic security.

Among the requirements that a state law had to meet to enable employers to secure credit against the federal tax were the following: that benefits be paid through public employment offices; that all taxes collected under the state law be deposited to the state's credit in the trust fund in the United States treasury from which they could be withdrawn only for the payment of benefits; that unemployment insurance could not be denied "to any otherwise eligible individual for refusing to accept new work under any of the following conditions: (1) if the position offered was due directly to a strike, lockout or other labour dispute; (2) if the wages, hours or other conditions of the work offered were substantially less favourable to the individual than those prevailing for similar work in the locality; (3) if as a condition of being employed the individual would be required to join a company union or to resign from or refrain from joining any bona fide labour organization."

To determine that a state was entitled to federal grants for the costs of administration, the secretary of labour had to find in the state law methods of administration reasonably calculated to ensure the full payment of benefits when due. These included the establishment and maintenance by the state of personnel standards on a merit basis and provisions for a fair hearing to anyone whose claim for benefits was denied. The secretary also had to find that there had not been a denial of benefits due under a state law in a substantial number of cases.

Grants to the states for the administration of unemployment insurance and the employment service were made quarterly. By the latter 1950s they totaled more than $220,000,000 annually.

State Responsibilities.—The state agencies collected and recorded taxes, received and passed upon claims for benefits, paid benefits, adjudicated disputes over benefits and managed state budgetary functions connected with the administration of unemployment insurance. They also furnished to the secretary of labour such reports as he might require. A nation-wide system of public employment offices was affiliated with the United States employment service of the bureau of employment security. Financed by federal funds, it was operated by the state agencies.

The states were free to enact unemployment insurance laws with such coverage, financing and benefit provisions as they desired. However, the state laws were strongly influenced by the provisions of the federal Unemployment Tax act.

Coverage.—This federal act originally taxed only employers of eight or more workers in 20 weeks in a calendar year. It remained unchanged in this respect until Sept. 1954 when it was amended to apply, as of Jan. 1, 1956, to employers of four or more workers. By 1956 all states covered employers of four or more workers; 23 states covered employers of fewer than four workers; 18 of these covered employers of one or more. About 80% of the work force was protected by unemployment insurance.

The growth in the labour force and in employment had increased the number of insured workers from 20,000,000 in 1938 to 36,000,000 at the beginning of 1955. The extension of coverage to federal workers in that year, and to firms employing four to seven workers in 1956, added another 4,000,000. The 12,000,000 wage earners still excluded in 1956 were in agriculture, domestic service, nonprofit religious, educational and charitable organizations and in state and local governments.

Benefits.—All state laws provided that weekly benefits be related to the weekly wages of the individual beneficiary, not based on claimants' sex and age, as in Great Britain. The original goal was to provide about 50% of wages, but the rise in wages immediately before and following World War II outstripped statutory maximums, and weekly benefits fell below that ratio in all states.

Pres. Dwight Eisenhower's economic reports of 1954 and 1955 suggested that states strengthen the benefit provisions so that most beneficiaries could receive half their weekly earnings for 26 weeks of unemployment.

During 1955, 32 states increased their basic weekly benefits. Maximum basic weekly benefits (without dependents' allowances), which had varied from $15 to $26 at mid-century, ranged from $24 to $45 after the 1955 amendments went into effect. Almost 70% of the covered workers lived in 32 states with maximum basic weekly benefits of $30 or more. About 73% of the covered workers lived in 27 states where the maximum potential duration of benefits was 26 weeks or more.

These changes did not fully achieve the president's goal. After they became effective, only seven states, with one-eighth of the covered work force, provided maximum basic benefits equal to half the state-wide average weekly wage.

The maximum potential benefits available to a claimant during a year varied widely. Fourteen states allowed potential benefits for the same number of weeks to all eligible workers. Thirty-six states limited the worker's total benefits to a fraction of his annual earnings, or limited the duration by a fraction of the number of weeks worked. In terms of money, maximum annual potential benefits (without dependents' allowances) ranged from $384 to $1,170 during 1956.

After mid-century, total annual benefit payments throughout the nation ranged between $840,411,000 in 1951 and $2,027,000,000 in 1954.

Dependents' Allowances.—By 1956 only 11 states had adopted provisions to increase the weekly benefits of claimants with dependents. The definition of dependent and the amounts of the allowances varied greatly from state to state. The laws usually provided an allowance of a specified weekly amount for each dependent, varying from $1 to $5, with a ceiling on the total allowance.

Disqualifications.—The major causes of disqualification from benefits were voluntary separation from work, discharge for misconduct, refusal of suitable work and unemployment arising from a labour dispute. The results of disqualification varied greatly from state to state. In some, benefit payments were postponed for a specified number of weeks on the theory that, after a time, the reason for a worker's unemployment resulted more from the general conditions of the labour market than from his disqualifying act. In other states, the disqualification lasted for the duration of the period of unemployment, and in some of these, all prior wage credits were cancelled, tending to put the claimant out of the system. Many states imposed penalties of varying severity for the different causes.

State Administration.—Certain administrative arrangements were common to all states. Every claimant filed his application for benefits at a public employment office and at the same time applied for work.

A report from the employment service or an employer that an applicant had refused suitable employment held up his right to benefits until it could be determined whether the refusal was justified. Each state law defined "suitable employment."

Procedures to settle disputed claims in all states authorized either the claimant or an interested employer to request a hearing before an appeal body on any decision denying or allowing benefits. Decisions of the appeal tribunals might be appealed further either to the state administrative agency or an independent review board, according to state law. Further appeal might also be made to the courts.

Financing.—Until 1954 federal unemployment tax collections went into the general treasury. The Employment Security Administrative Financing act approved in Aug. 1954 earmarked the proceeds of the federal tax for the employment security program. The annual excess of the federal collections over the costs of administration were automatically appropriated to the federal unemployment trust fund account. This account was to be maintained at a level of $200,000,000 for loans to states with depleted reserves. The excess collections beyond $200,000,000 were to be returned to the states for use in financing benefits and, under certain circumstances, for financing administration.

Experience Rating.—The federal law provided that employers could receive tax offset credit not only for the state taxes they paid, but also for those waived under a state experience rating system. Accordingly, all state laws provided for modifying employers' tax rates according to their experience with unemployment "or other factors directly related to unemployment risk."

As a result of the high payroll and employment levels during most of the program's history, and especially after 1941, many states reduced employer tax rates sharply from the 2.7% rate at which they began. Average tax rates fell to about 1.2% by 1947 and were at about that level in 1956.

World War II Servicemen's Readjustment Allowances.—The Servicemen's Readjustment act of 1944 provided veterans' allowances of $20 for each week of involuntary unemployment, up to 52 weeks. It also provided benefits to "self-employed" veterans trying to establish businesses or professions. The state agencies paid the benefits as agents of the federal government. More than 9,500,000 of the 15,100,000 World War II veterans filed claims for these benefits and were paid $3,800,000,000 in the five-year period of its major operations.

Unemployment Compensation for Veterans.—In Oct. 1952 a program providing unemployment compensation for veterans with military service between June 27, 1950, and Jan. 31, 1955, became effective under the Veterans' Readjustment Assistance act of 1952. Known as UCV, this program provided payments of $26 a week for each week of involuntary unemployment up to a maximum of $676. If a veteran qualified for unemployment insurance under any other law he could receive under the UCV law only the difference between $26 and the amount he was entitled to receive under the other program. To be eligible for these benefits, veterans had to meet all requirements of the law of the state through which the payment was made. Between Oct. 1952, when the program began, and Dec. 1955, benefits under this program totaled $240,000,000. During this period more than 1,000,000 veterans had filed claims for UCV benefits, about 750,000 of them had received at least one benefit payment and 139,000 had exhausted their $676.

Unemployment Compensation for Federal Employees.—Federal civilian workers became eligible for unemployment compensation on Jan. 1, 1955. Financed by federal funds, this program, like the veterans' programs, was administered by the state agencies. Unemployed federal workers were paid benefits in the same amounts and under the same conditions as workers in private employment in the applicable jurisdiction, which was usually the state in which the federal worker had his last official station. During 1955, the first year of operation, more than 165,000 claims were filed. Approximately 93,000 unemployed federal civilian workers received nearly $29,000,000 in benefits.

Temporary Disability Insurance Co-ordinated With Unemployment Insurance.—During the 1940s four unemployment insurance programs were expanded to provide weekly cash benefits to workers whose unemployment was due to inability to work as well as to those unemployed because of lack of work. Enacted in 1942 (Rhode Island), 1946 (California), 1947 (the federal Railroad act) and 1948 (New Jersey), these four temporary disability insurance (or cash sickness insurance) laws covered the same workers as the unemployment insurance laws with which they were jointly administered. The Rhode Island and California programs were financed by a 1% worker tax which had formerly been paid for unemployment insurance. In New Jersey workers paid one-half of 1% and employers, one-fourth of 1%. The railroad program was financed by an employer tax formerly paid for unemployment insurance.

Temporary disability benefits were paid under these laws to workers unable to perform their usual work because of illness or accident. California, New Jersey and the railroad program excluded disabilities covered under the workmen's compensation laws; and the California and New Jersey programs also excluded disability due to pregnancy.

California and New Jersey permitted individual establishments to substitute private group insurance for the state plan. Nearly half of the covered workers in California, and about two-thirds of those in New Jersey were under such private plans by 1956. In that year about 6,000,000 workers were covered by the four plans. In addition, in 1949 New York enacted a disability benefit law not co-ordinated with unemployment insurance. Under the New York program, private insurance was emphasized and the worker derived his rights to benefits from the insurance contract rather than from the law. Those coming within the law could be prosecuted for not having provided the insurance, either by self-insurance or by the purchase of insurance from private companies or a state-owned corporation. But this did not automatically protect the worker. (R. C. GN.)

GREAT BRITAIN

Great Britain was the first country to establish a national system of compulsory insurance by the National Insurance act of 1911. Later the same policy was followed in many other countries. The act of 1911 covered only a few industries and 2,250,000 workers. Very few women were covered. Employers and workers each contributed 2½*d.* a week and the exchequer grant was equal to one-third of the total receipts from employers and employed. The rate of benefit was 7*s.* a week for adults, half rates for persons between 17 and 18 years of age. A one-week waiting period was followed by a right to draw a week of benefits for every five contributions paid up to a maximum of 15 benefit weeks in one year. To obtain benefit a person had to show that he had worked in an insured trade in 26 weeks during the preceding five years, had applied at the employment office for work, had since been continuously unemployed, was capable of work and had not exhausted his right to benefit. He could be disqualified if idle voluntarily through misconduct or because of a labour dispute. An insurance officer decided upon his application subject to power of appeal to a court of referees and final reference to an umpire appointed by the crown. The scheme was administered by the board of trade until it was taken over by the ministry of labour in 1917. A national system of employment exchanges had been established as an essential factor in the new scheme.

After World War I unemployment was severe and the insurance scheme was inadequate to meet the situation. Accordingly the Out-of-Work Donations act was passed in 1918 to provide assistance out of general taxation.

The Act of 1920.—The next major alteration was effected by the Unemployment Insurance act, 1920, which brought into insurance an additional 8,000,000 persons above the 4,000,000 already covered. The scheme was then made applicable to all persons of 16 years of age and upward employed under a contract of service or apprenticeship (except apprentices without a money payment), save those in certain excepted employments, mainly agriculture, private domestic service, government service, local government, railway and general utility companies. Nonmanual workers in receipt of remuneration exceeding £250 a year were also excepted. The waiting period was reduced to three days. Benefit and con-

tribution rates and conditions for the receipt of benefits were altered.

Twenty Acts (1920–30).—Various alterations were made in the scheme by 20 acts of parliament during the next ten years. These were influenced considerably by mass unemployment and removed some of the restrictions on the granting of benefit. Provision was made for uncovenanted benefit for those whose rights under the main scheme had been exhausted. Rates of benefit and contribution were both increased and reduced several times but the debt on the insurance fund continued to increase and reached £25,000,000 in March 1927.

Following an examination of the whole subject by a committee under the chairmanship of Lord Blanesburgh the Unemployment Insurance act of 1927 was passed which made a number of alterations, including the creation of a class of young persons between 18 and 21 years of age and the abolition of extended benefit.

Drain on the Insurance Fund.—The unemployment insurance fund became still more insolvent. In 1931 benefits cost £125,000,000 while the contributions of employers and workers were less than £30,000,000. Benefits were reduced, later restored, and generally the operation of the scheme was made more stringent. This situation caused many unemployed men to apply for outdoor relief from the boards of guardians. The cost was, however, spread unevenly throughout the country, and the government was compelled to take action by providing a new form of relief called "transitional payments," subject to a means test. This scheme was administered by the boards of guardians at the cost of the national exchequer. Deep resentment by many people followed by considerable agitation caused the financial assistance of the unemployed outside the insurance scheme to be made a national responsibility by the establishment of the Unemployed Assistance board by the Unemployment Assistance act, 1934. It then became the duty of the board to provide assistance for all persons between the ages of 16 and 65 who were out of work whose normal occupation was an employment in respect of which contributions were payable under the national insurance schemes and who were capable of and available for work. Unemployment assistance (or national assistance as it was called later) continued to be available in supplementation of the national insurance scheme.

Effect of the Beveridge Report.—The comprehensive scheme provided by the National Insurance act, 1946, resulted from the report of the interdepartmental committee on social insurance and allied services presided over by Lord (then Sir William) Beveridge. The minister of national insurance was made responsible for the administration of the scheme. Coverage was extended without any exceptions to all persons aged 16 to 65 (60 for women) employed under a contract of service. This scheme brought in about 4,000,000 new contributors. Benefit became payable, after a three-day waiting period, at the rate of 26*s.* a week for persons over the age of 18; 20*s.* for married women; and 15*s.* for persons under the age of 18. In the case of a married woman or young person entitled to an increase for an adult dependent, or in the case of a married woman with a dependent child, the rate was 26*s.* An additional 16*s.* a week was payable for an adult dependent and 7*s.* 6*d.* for the first child (the others being covered by the family allowance scheme). The conditions for receipt of benefit were the payment of 26 contributions between entry into insurance and the day for which benefit was claimed, with an average of 50 contributions paid or credited (for periods of unemployment, sickness, etc.) in the last contribution year. Benefit continued to be payable weekly in cash at employment exchanges, which continued to be operated by the same ministry as before, which was now called the ministry of labour and national service.

Standard maximum duration of benefit was 180 days; after five years' coverage this duration might be gradually increased for additional contributions (not offset by benefits) up to 130 days more. Extended benefit might then be awarded by local tribunals after taking into account the claimant's circumstances but without imposition of means test (the right to extended benefit was later withdrawn).

Provision was made for claims for benefit to be decided by an insurance officer in the ministry of national insurance who might refer the question to a local tribunal. This tribunal consisted of (1) one member representing employers and persons other than employed persons; (2) one member representing employed persons; and (3) a chairman appointed by the minister. A claimant could appeal to the tribunal against a decision of the insurance officer. In certain circumstances there was a further right of appeal to the national insurance commissioner.

A person who lost his employment by reason of a stoppage of work due to a trade dispute at his place of employment was disqualified (subject to certain exceptions) during the stoppage except where he had meanwhile become bona fide employed elsewhere in his usual occupation or regularly engaged in some other occupation. A person was disqualified for a period not exceeding six weeks if (1) he had lost his employment through his misconduct or voluntarily left it without just cause; or (2) he had refused or failed without good cause to apply for suitable employment notified to him by an employment exchange; or (3) he had neglected to avail himself of a reasonable opportunity of suitable employment; or (4) he had without good cause refused or failed to carry out any reasonable written recommendation given by an officer of an employment exchange to help him find suitable employment; or (5) he had without good cause refused or failed to take reasonable opportunity of receiving approved training to make him or keep him fit for regular employment.

The National Assistance act, 1948, continued the responsibility of the board (now called the Assistance board) to grant assistance to insurable unemployed persons not qualified for unemployment benefit and to persons receiving such benefit who found it insufficient for their needs.

By the National Insurance act, 1954, benefit rates were increased to 40*s.* with an increase of 11*s.* 6*d.* for an only child or the eldest child; 3*s.* 6*d.* for each additional child and 25*s.* for an adult dependent. The rate for a person under the age of 18, with no dependent, was fixed at 23*s.*

(*See* also GREAT BRITAIN: *Industrial and Social Conditions.*)

OTHER COUNTRIES

Unemployment insurance schemes had been adopted by 23 nations at mid-20th century, including the limited-coverage scheme in Chile (for salaried employees only), Greece (where the arrangements were restricted to certain areas) and Uruguay (with special schemes in the wool and hide and cold storage industries, as well as pensions for unemployed persons with long coverage under the retirement system). Nineteen plans were compulsory and four (Denmark, Finland, Sweden and Switzerland) were government-subsidized trade-union schemes.

Europe.—The European countries with schemes in operation were Austria, Belgium, Bulgaria, Denmark, the Republic of Ireland, Finland, France, German Federal Republic, German Democratic Republic, Greece, Italy, Netherlands, Norway, Sweden and Switzerland. In Spain the voluntary plan formerly in existence had been replaced by public works. In the U.S.S.R. unemployment insurance was discontinued in 1930; in Czechoslovakia, in 1948.

The European schemes generally provided for rates of benefit according to the size of the family. But in Denmark provision was also made for fuel and rent allowances where there was prolonged unemployment. In the German Democratic Republic the scheme provided a basic benefit of one-fifth of the previous earnings of the unemployed person subject to a minimum and a maximum daily rate. This was supplemented by a housing allowance varying according to the size of the town or village in which the person was living. In Sweden, where unemployment insurance was voluntary, an unemployed person not so covered received unemployment relief through public works or cash assistance granted by the state or by municipalities subsidized by the state.

Outside Europe.—Outside Europe, by mid-20th century, unemployment insurance schemes had been adopted by Canada, Japan, United States, Union of South Africa and Uruguay.

Canada.—The existing unemployment insurance scheme in Canada came into operation in July 1941 and provided for a contributory scheme administered by the unemployment insurance commission. Regional and local officers throughout the country

dealt both with applications for employment and claims for unemployment insurance benefit. All persons employed under a contract of service were insured unless specifically excepted. The exceptions included such employment as agriculture, fishing, domestic service, schoolteaching and employees in certain categories with annual earnings exceeding $4,800; otherwise persons were insured regardless of earning level. Employers and insured workers contributed equally, the contributions being based on the wages or salary earned. The federal government added one-fifth of the total employer-employee contribution and paid administrative costs. The contributions varied from a minimum of 18 cents weekly to a maximum of 54 cents, the latter applying to persons earning $48 a week or more. Rates of benefit varied from $4.20 weekly for a person without a dependent with an addition of 60 cents for a dependent to $17.10 a week and an addition of $7 a week respectively.

Australasia.—In New Zealand unemployment benefit was subject to a means test as in the case of other social security benefits. The scheme was administered by the social security department. During the year ended March 31, 1955, only 93 applications for unemployment benefit were granted and 57 refused. There were only 19 benefits in force at March 31, 1955. The total expenditure for the year amounted to £5,660. The average duration of unemployment benefits which ceased during the year was 8.4 weeks for males and 10.3 weeks for females.

In Australia no contributory unemployment insurance scheme existed in the mid-1950s but unemployment benefit was payable under a means test to persons who had been in Australia for 12 months and intended to reside there permanently. The scheme was administered by the commonwealth social services department. At June 30, 1955, current benefits totaled 2,679.

General Characteristics.—Other schemes both in and outside Europe varied in detail but through the influence of international bodies such as the International Labour office and the United Nations there was a tendency for them to follow a somewhat uniform pattern. The conditions to be satisfied under the various national systems differed in points of detail, but there were broad lines of resemblance in most of them. For instance, the unemployment against which the worker was insured was involuntary unemployment. Nor would he be paid benefit under the schemes if there was suitable employment which he could take up. In this connection it was worthy of note that in countries which had instituted compulsory systems employment offices had been established by means of which the existence of suitable employment might be known and jobs offered to the unemployed. The loss of work through a labour dispute in which the worker was involved was commonly a reason for disqualification although there were various refinements on this point; *e.g.*, the duration of the disqualification might be for the period of the dispute or for any period after it had ended until the worker was again employed. Voluntarily leaving work without good cause and dismissal for misconduct were also generally grounds for refusal of benefit.

The financing of the various schemes differed in some respects but in most schemes the employer, the insured person and the government contributed. In a few the employer was the only contributor and in others the government made no contribution.

UNGAVA, originally the native name for the region south of Hudson strait and thus a part of the historic Rupert's Land (*q.v.*). The name was adopted officially by Canada by order in council Oct. 2, 1895, as that of a district of the Northwest Territories. But the Boundaries Extension act of 1912 annexed Ungava to the province of Quebec. The northern portion of this province is bounded by Hudson bay on the west; Hudson strait and Ungava bay on the north; and the coast strip of Labrador on the east. The area is estimated at more than 300,000 sq.mi. and includes much of the lower portion of Labrador, with a rim of recent marine deposits along its western coast, but the interior has the usual character of low rocky hills of Archean rocks, especially granite and gneiss, with a long band of iron-bearing rocks, resembling the Animikie, or Upper Huronian of the Lake Superior region, near its eastern side. Along Hudson bay shore there is a strip of similar rocks, and a long row of small islands of the same age, with great sheets of trap or diabase forming the tops of the hills. In 1949 intensive development began on a proven initial reserve of 300,000,000 tons of high-grade iron ore located in roughly the centre of Ungava. Recovery involved creation of a seaport at Sept Iles, Que., on the Gulf of St. Lawrence, and building a 360-mi. railway to the ore field.

Ungava, like the rest of Labrador, has risen several hundred feet since the Ice Age, marine beaches being found up to 700 ft. on the Hudson bay side; and it is interesting to find seals like those of the adjoining sea coasts in the Seal lakes 100 mi. inland and 800 ft. above the present sea level. Because of its northerly position a large part of Ungava is treeless, and belongs to the barren grounds where caribou roam and feed on the so-called caribou moss, a grayish lichen.

Until the mining development began, Ungava inhabitants were chiefly migratory Eskimos, wards of the government. Pop. (1951) 4,470. (C. CY.)

UNGER, FRANZ (JOSEPH ANDREAS NICOLAUS) (1800–1870), Austrian physician and botanist, was born at Amthof in Steiermark on Nov. 30, 1800. Unger studied medicine in Graz, Vienna and Prague. He practised in Stockerau and Kitzbühel and in 1833 became professor of botany at the University of Graz. In 1849 he went to Vienna to occupy the chair of plant physiology. In 1866 he retired to live in the country near Graz where he died on Feb. 13, 1870.

Unger made many contributions to the understanding of plant anatomy and physiology, and was also much interested in plant palaeontology. Among his published works were *Die Exantheme der Pflanzen* (1833); *Ueber den Bau und das Wachstum des Dikotyledonenstammes* (1840); *Anatomie und Physiologie der Pflanzen* (1855); *Chloris protogaea, Beiträge zur Flora der Vorwelt* (1841–47); *Sylloge plantarum fossilium* (1860–64); *Versuch einer Geschichte der Pflanzenwelt* (1852); *Botanische Streifzüge auf dem Gebiet der Kulturgeschichte* (1857–67).

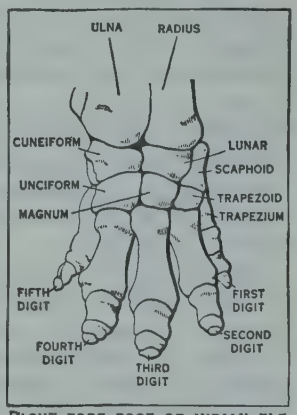
UNGER, RUDOLF (1876–1942), German writer and literary critic, born in Hildburghausen. He studied in the universities of Heidelberg, Munich and Berlin, and in 1911 became professor in literature at Munich. After 1921, he was professor of German literature at Göttingen. He was noted for his studies in the period of Goethe. He edited *Obras de Goethe* (1910) and wrote *Philosophische Probleme in der neueren Literaturwissenschaft* (1908), *Weltanschauung und Dichtung* (1917), *Gesammelte Studien* (1929), etc. He died Feb. 5, 1942.

UNGULATA, an order or superorder of placental mammals including the hoofed herbivorous quadrupeds. Aristotle in his work on *The Parts of Animals,* in describing the extremities of the viviparous quadrupeds, says that ". . . some are bifid and have hoofs instead of nails, as the sheep, the goat, the elephant, the hippopotamus; and some have undivided feet, as the solid-hoofed animals, the horse and the ass. . . ."

After the Renaissance, E. Wotton (1552), following Aristotle, divided the viviparous quadrupeds into the many-toed, double-hoofed and single-hoofed. In 1693 John Ray divided the viviparous quadrupeds into two grand divisions, the Ungulata, or hoofed, and the Unguiculata, or clawed, forms. The former were subdivided into: (1) the Monochela, or Solidipeda, with solid hoofs, including the horse, the ass and the zebra; (2) the Dichela, or Bisulca, with cloven hoofs; and (3) the Tetrachela or Quadrisulca, including the rhinoceros and hippopotamus. The Dichela were again subdivided into the Ruminantia, or ruminants, and the Non-ruminantia, or swine; the Ruminantia were finally divided into

those with permanent horns, namely the cattle, sheep and goats, and those with deciduous horns, of the deer kind. Here then was a usable and nearly correct classification of the ungulates before the beginning of the 18th century.

Subsequent discoveries have added to the Ungulata a great many extinct and some recent groups which were wholly unknown to Ray. Thus in Osborn's *Age of Mammals* (1910) the "Cohort Ungulata" includes no less than 13 "orders" of hoofed mammals. While each of these is a more or less natural group of animals related by descent from a common ancestral stock, the derivation and interrelationships of the orders themselves are still far from clear. It is well established that the typical ungulates, namely the Perissodactyla (horses, tapirs, rhinoceroses, etc.) and the Artiodactyla (ruminants, swine, etc.) were wholly distinct from each other in the Lower Eocene, some 50 to 60 million years ago. It is indeed not improbable that the ungulate, or hoofed herbivorous type, was evolved several different times from different families of placental mammals of the Cretaceous period, or in other words, that many of the resemblances between ungulate orders are examples of either parallel or convergent evolution.



RIGHT FORE FOOT OF INDIAN ELEPHANT, SHOWING PARTS

Order Condylarthra.—In the Basal Eocene formations of New Mexico and in the Lower Eocene of Wyoming have been found the fragmentary jaws and teeth, and very rarely more or less entire skeletons, of small hoofed mammals which on the whole were *structurally* intermediate between the oldest creodonts or flesh-eaters, and the true ungulates. Of these the most primitive was the genus *Mioclaenus,* known chiefly from the conical-cusped upper molars, which recall those of such primitive carnivores (creodonts) as *Tricentes* and *Claenodon.* Somewhat higher in the scale was the group of species of the genus *Hyopsodus*; these little animals were about as large as a hedgehog, the skull being of remarkably generalized type. The dental formula, (Incisors $\frac{3}{3}$ Canines $\frac{1}{1}$ Premolars $\frac{4}{4}$ Molars $\frac{3}{3}$)$\times 2 = 44$, was that of other very primitive placental mammals. The crown-patterns of the molar teeth were advancing ever further away from the primitive tritubercular type toward the more typical condylarth types presently to be described.

By far the most famous condylarth was the Lower Eocene *Phenacodus primaevus,* an animal about as large as a Newfoundland dog, which has figured in many textbooks as the "five-toed ancestor of the horse." But W. D. Matthew has advanced decisive evidence against this view. For in *Phenacodus* (*q.v.*) each quadrangular upper molar had four conical main cusps and two very small intermediate cusps or conules; whereas in the contemporary ancestors of the horse family the oblique crests of the molars were progressively developed. Even in the Lower Eocene genus *Ectocion,* which was related to *Phenacodus,* the detailed patterns of the upper and lower molars were not quite right to be structurally ancestral to the molars of the primitive horses. Another Eocene condylarth, the genus *Meniscotherium,* had more complex upper molar patterns of the type known as buno-lopho-selenodont (*i.e.,* with cones, ridges and crescents), which in some respects foreshadow the general molar types of such later ungulates as the hyracoids, the chalicotheres and the litopterns.

The foot structure of the condylarths was likewise of interest. In the five-toed hind foot the ankle bones were much like those of a contemporary creodont, with a ball-and-socket joint at the lower end, an arrangement to which the name Condylarthra refers. In the fore foot of *Phenacodus* the two rows of carpal bones were placed directly above each other, "like unstruck bricks," whereas in typical ungulates a more displaced, or alternating arrangement, was the rule. E. D. Cope supposed that *Phenacodus* was in this respect also ancestral to later ungulates but Matthew showed that in both *Phenacodus* and the later ungulates the contrasting arrangements of the carpal elements above mentioned were probably both derived independently from the still older interlocking creodont type.

Amblypoda.—In the basal Eocene of New Mexico occur the fragmentary remains of a diversified series of small hoofed mammals collectively known as Pantodonta or taligrade Amblypoda. Some of the smaller genera were hardly bigger than insectivores and with teeth suggestive of insectivore-creodont ancestry, while the larger taligrades (*Periptychus, Pantolambda*) were about the size and proportions of stocky badgers. The upper molar teeth in the smaller forms had three main cusps arranged in a triangle with the apex toward the inner side; the small intermediate cusps or conules were more or less circular; the main internal cusp was flanked by small cusps borne by the anterior and posterior ridges or cingula. In *Periptychus* the upper molar cusps were all subcircular and the enamel surface was pleated. The brain-cast indicates a brain of extremely primitive form with large olfactory lobes and a minimum development of the neopallium. In *Pantolambda* the upper molar crowns bore two sharp outer V's and a centrally placed conical internal cusp.

In all the taligrades the feet were short, especially so in *Pantolambda.* This feature becomes greatly emphasized in the later members of the order, the coryphodons and Dinocerata *Coryphodon* is characteristic of the Lower Eocene of Wyoming and England. It was broad-headed and almost hippopotamus-like. Related forms have recently been found in the Eocene of Mongolia. *Uintatherium, Dinoceras* and their allies were characteristic of the later Eocene. Their bodies were gigantic, larger than modern rhinoceroses, with massive, post-like limbs and extremely short stubby toes. They had sabre-like upper tusks, six or more horn-like bony outgrowths on top of the skull and a brain of low type.

Notoungulata.—The condylarths and taligrades disappeared from the fossil record of the northern hemisphere in early Eocene, but there is some reason to believe that some of them reached South America and there gave rise to the amazingly varied series of herbivorous mammals which are often referred to collectively as notoungulates. These flourished for millions of years in Patagonia and adjacent regions, while the perissodactyls, artiodactyls and other ungulates held sway in the northern world. These notoungulates exemplified the law of adaptive radiation on a grand scale. Protected by geographical barriers from the deadly competition of their larger-brained northern analogues, they exploited all the economic possibilities for ungulates available in South America and gave rise to the wide diversity of forms that covered the ancient pampas. Some (the protypotheres) were small and swift-running like rabbits; others (the smaller litopterns) were like slender-limbed three-toed horses; some (*Macrauchenia*) paralleled the llamas and camels; others closely paralleled the rhinoceroses, while a few almost rivalled the elephants in bulk (*Pyrotherium*).

Litopterna (*q.v.*).—Among the most primitive of the entire series of notoungulates is the genus *Didolodus,* a small forerunner of the litopterns known only from the upper cheek-teeth, which in some ways recall those of the smaller taligrades. In the swift-footed proterotheres of the Miocene of Patagonia both cheek-teeth and feet suggest those of the Oligocene three-toed horses of the northern world. But in the upper molars the main inner cusp is central rather than anterior in position and the posterior cross-crests fail to meet the middle point of junction of the two main outer cusps, as they do in the three-toed horses, while the feet, although superficially horse-like, differ profoundly from the horses in the detailed arrangements and contacts of the tarsal elements. The larger litopterns (*Theosodon, Macrauchenia*), while in general appearance paralleling llamas and camels, yet are more nearly related to the horse-like proterotheres in their deeper characters.

Notioprogonia.—In the "*Notostylops* beds" of Lower Oligocene or Upper Eocene in Patagonia occur a strange group of ungulates, varying in size from a rabbit to a rhinoceros. Of these the most famous form, *Notostylops,* had a small skull in which the upper grinding teeth have oblique and flattened outer walls remotely

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

EXTINCT MAMMALS OF TERTIARY AND QUATERNARY TIMES

1. Skeleton of Lower Eocene *Phenacodus primaevus*, believed to be a five-toed ancestor of the horse
2. Skeleton of Upper Oligocene *Diceratherium*, an extinct species of Rhinoceros
3. Skeleton of *Neohipparion whitneyi*, a horse of the Upper Miocene plains region of North America. The outline is restored
4. Skeleton of Lower Miocene *Moropus*. It stood about six feet high at the shoulders and resembled a large horse
5. Skeleton of *Bison occidentalis*, extinct North American mammal of the Quaternary period, inhabiting Kansas and Alaska. Closest species to the existing bison
6. Pleistocene North American *Mastodon americanus*, forerunner of the elephant

suggesting those of recent rhinoceros. The lower molars bore long obliquely-placed blades on the hinder part or talonid. The skull as a whole suggests that of the recent *Hyrax*. In certain early members in which the feet are known there are five digits on the fore and hind feet, the terminal bones are cleft for the attachment of fairly large hoofs, the main ankle bone (astragalus) is more or less flattened. A single very small jaw, the genus *Arctostylops* of Matthew, found in the Lower Eocene of Wyoming, appears to be related to these South American Notioprogonia. Another apparently related type is found in the Eocene of Mongolia. These small jaws seem to increase the probability that the South American Notioprogonia, like other members of the notoungulate series, had been derived from some basal Eocene or Upper Cretaceous forerunners of the taligrades and condylarths of the northern world.

The *Astrapotheria,* gigantic Santa Cruzian (Lower Miocene) forms with long downwardly growing tusks, may be highly specialized derivatives of some early member of the Notoungulata.

Toxodontia (*q.v.*).—These were perhaps the most numerous in species of all the notoungulate series. One of the best known primitive toxodont is the Santa Cruzian (Lower Miocene) genus *Homalodontotherium,* a larger form in which all the teeth had become high-crowned and all the incisors, canines, premolars and molars were pressed together in a continuous series without break or interval. The Santa Cruzian (Lower Miocene) *Nesodon* was about the size of a rhinoceros but with the back curved and the limbs shorter. The front teeth were enlarged and flattened for cropping vegetation, the upper molar teeth had extremely long oblique outer walls and folded wearing surfaces. The three-toed feet, although rhinoceros-like in appearance, agreed with those of the litopterns in their fundamental characters. The Pampaean (Pleistocene) *Toxodon* was still larger, with a gigantic head and a huge curved back. This was one of the famous fossil South American mammals studied by C. Darwin (see *Voyage of the Beagle*).

Typotheria.—The smaller genera of this group, named protypotheres, included some that broadly resembled *Hyrax* and others that were rabbit-like. They were very abundant in the Lower Miocene of Patagonia. The extremely high-crowned molar teeth were much curved transversely, as in some rodents, and were adapted for grinding tough vegetation. The later form, *Typotherium,* from the Pampaean or Pleistocene of Argentina, had rodent-like incisors. It was about as large as a brown bear. This group is rather closely related to the toxodonts.

Pyrotheria.—In these curious animals the molars were bilophodont, that is they bore two cross-crests like those of tapirs and dinotheres. The skull in some ways resembled those of the Proboscidea (*q.v.*) and the same is true of the tusks, but on the whole it seems more likely that the pyrotheres are simply the South American analogues of the Proboscidea.

Hyracoidea (*q.v.*).—This characteristically African group is represented today by the "coneys" or dassies of southern and west Africa, Abyssinia, Arabia and Syria. These furry little animals have but slight external resemblance to ungulates but their jaws and teeth abound in resemblances to ungulates of many groups. The internal anatomy shows a curious mixture of resemblances to elephants and perissodactyls. There is no satisfactory evidence, however, of the relationship of *Hyrax* to any of the groups so far named. The hyracoids as a group must have been in Africa for many millions of years, since various forms of fossil hyracoids have been found in the Lower Oligocene of the Fayûm district in Egypt. In some of these very ancient hyracoids (*Megalohyrax*) the molar teeth recall those of Eocene titanotheres or of *Meniscotherium* among the condylarths. In its skull *Megalohyrax* was more or less swine-like.

Embrithopoda.—While the hyracoids played the part of the small ruminants in the ancient fauna of the Fayûm, the economic rôles of the rhinoceroses and elephants were assumed by gigantic beasts named *Arsinoitherium* (*q.v.*) in honour of an Egyptian queen. In these very strange animals the whole fore-part of the skull was surmounted by an enormous pair of bony horns, which in the front view rose to a great height. The folded surfaces of the molar teeth remotely recall those of the American Eocene amblypods, but the premolars rather suggest relationships with the hyracoids. The body was very massive and the skeleton shows a curious mingling of resemblances to elephants and amblypods, doubtless the results of similar adaptations to slow browsing movements and the support of the immense body weight. The existence of these highly specialized animals in Africa at such an early date as the Lower Oligocene and their apparent isolation, in spite of their adaptive resemblances to elephants and amblypods, all indicate a very long line of less and less specialized ancestors, traces of which may some day be discovered when still older fossil-bearing horizons are discovered elsewhere in Africa.

Barytherioidea.—Another strange type of extinct ungulate (named *Barytherium grave* by C. W. Andrews) was discovered in the Fayûm district of Egypt along with the fossil hyracoids, arsinoitheres and ancestral elephants. The only parts of the animal found were a large lower jaw, a humerus and a radius, all of which show a curious mixture of resemblances on the one hand to the primitive proboscidean *Moeritherium* and on the other hand to *Dinoceras* of the Amblypoda. In a general way it also resembles the ancient South American *Pyrotherium*.

Proboscidea.—The evolution and structure of the elephants (*q.v.*) are considered in the article PROBOSCIDEA, and further information can be found in H. F. Osborn's *Monograph* of this group. As to the remote origin of the Proboscidea, the fact that *Arsinoitherium,* in spite of its wholly different skull and dentition, shows so many curiously detailed resemblances to the Proboscidea in its limbs and backbone, lends some support to a view that the Paenungulata, a superordinal group, consisting of the Proboscidea, Hyracoidea, Embrithopoda, Amblypoda, may after all be a more or less natural assemblage of ungulates. In fact we may even advance the tentative hypothesis that some such small Lower Eocene condylarth as *Hyopsodus walcottianus* (described by Matthew and Granger), with short spreading feet, reduced canines, slightly procumbent incisors and bunodont molars, would have been an ideal starting-point for the entire subungulate series, including also the South American Pyrotheria and the Sirenia.

Sirenia (*q.v.*).—If "common sense" and superficial appearances were trustworthy, these surprisingly whale-like mammals would still be classified with the Cetacea (*q.v.*) as they were by all early naturalists. But De Blainville as far back as 1816 classified them as *"ongulogrades anomaux pour nager"*—anomalous ungulates adapted for swimming; in his later classification he brigaded them with the Proboscidea under the term "Gravigrades." Andrews in his description of *Eotheroides* (the oldest known sirenian, from the Upper Eocene of the Fayûm, Egypt) pointed out a number of significant features in which the skull of *Eotheroides* resembled that of *Moeritherium,* the oldest and most primitive known proboscidean from the same formation. He also cited a number of curious anatomical details in which even the modern Sirenia agree with the elephants in spite of the enormous difference in their external appearance and mode of life. On the other hand, R. Lydekker pointed out that the unworn molar teeth of certain extinct sirenians were curiously like those of certain extinct artiodactyls (*Merycopotamus*) and that this fact suggested the derivation of the Sirenia from very early Eocene artiodactyls; but one might equally say that the molar teeth of another extinct sirenian (*Miosiren*) suggest those of the Eocene rodent *Ischyromys* and that the order Sirenia had therefore been derived from primitive rodents. Either of these views would be hard, in the present meagre state of our knowledge of the subject, to disprove; but neither has nearly as much positive evidence in its favour as the view of De Blainville and Andrews that the Sirenia are an aquatic specialization from the Proboscidean stem.

Be that as it may, however, by the time of the Lower Oligocene *Eotheroides* was already definitely a sirenian in its dentition, skull and locomotor skeleton. Thereafter during the Oligocene, Miocene, Pliocene and Pleistocene epochs the changes in the skull and skeleton were comparatively slight and unimportant. The middle and late Tertiary sirenians (such as *Halitherium* and *Halianassa*) were for the most part considerably larger than the modern manatees and dugongs (*qq.v.*) and had a large vertically-

placed pair of upper tusks, which have been retained by the dugongs but lost by the manatees.

The Sirenia are whale-like in their torpedo-like bodies and horizontal tail flukes, in the complete absence of external hind limbs and in their flipper-like forelimbs, which however still retain external nails or vestigial hoofs. They differ markedly from typical cetaceans in their relatively small heads, truncate flattened snouts with transversely expanded upper lips covered with very large bristles. The molar teeth are two-ridged,—wholly unlike the conical teeth of toothed cetaceans. Their tusks when present are situated at the end of the muzzle and directed downward. They differ profoundly from cetaceans in their food and feeding habits, being the herbivores of the coasts and estuaries, whereas at least the typical cetaceans are essentially carnivores of the open seas. In their internal anatomy the sirenians likewise differ widely from cetaceans: the musculature of the forelimbs is less profoundly modified for aquatic life, the brain has a much less complexly convoluted surface and the digestive tract recalls that of the ruminants. The skeleton of sirenians is peculiarly massive and dense, the swollen, heavy ribs serving apparently as ballast to keep these voluminous, gas-filled bodies below the surface.

Most of the many known extinct types of sirenians conform in essentials to the dugong type, but one extinct family, the Miocene Desmostylidae, is widely different from the rest. In these the large upper tusks almost suggest the earliest proboscidean types but the most remarkable peculiarity is found in the molar teeth, each of which consists of a closely packed cluster of cylindrical columns of circular cross-section.

Perissodactyla.—*See* PERISSODACTYLA.

Artiodactyla.—This order is chiefly dealt with in the article ARTIODACTYLA. Here it may be noted that attempts, as by Cope and others, to brigade the artiodactyls with the perissodactyls under the terms Taxeopoda or Ungulata Vera have in the long run only served to bring out the entirely artificial nature of such an assemblage and to throw into relief the significant differences which widely separated these two orders from each other as far back as Lower Eocene times. There is indeed more to be said in favour of the view that the Artiodactyla may be an offshoot of some forerunner of the mesonychid family of the creodonts, while the Perissodactyla may be related remotely to the Cretaceous ancestors of the condylarths. Recent studies by Miss H. S. Pearson on the skull structure of the earliest artiodactyls have revealed that at a very early date the order was already subdivided into two series, one the amastoid series, in which the mastoid region of the periotic bone was completely covered by the squamosal and adjacent elements (as in the suines and their extinct relatives) and the other, or mastoid series, in which the mastoid was well exposed on the outer side, as in the Eocene Dichobunidae and all the ruminant artiodactyls.

In conclusion, much future palaeontologic exploration, in Africa, in Mongolia and many other parts of Asia, will doubtless be necessary before many of the problems touched upon in this article can be pushed forward nearer to solution.

UNICORN, a fabulous beast, usually having the head and body of a horse, the hind legs of an antelope, the tail of a lion (sometimes horse's tail), sometimes the beard of a goat, and as its chief feature a long, sharp, twisted horn, similar to the narwhal's tusk, set in the middle of its forehead (Lat. *Unicornis*, single-horned, Gr. *μονόκερως*). The earliest description is that of Ctesias, who (*Indica opera*, ed. Baehr, p. 254) states that there were in

THE UNICORN OF LEGEND AND HERALDRY

The centre illustration shows the heraldic unicorn, and those on the left and right, the Chinese and Japanese varieties respectively

India white wild asses celebrated for their fleetness of foot, having on the forehead a horn a cubit and a half in length, coloured white, red and black; from the horn were made drinking cups which were a preventive of poisoning. Aristotle mentions (*Hist. anim.*, ii. 1; *De part. anim.*, iii. 2) two one-horned animals, the oryx, a kind of antelope, and "the so-called Indian ass." In Roman times Pliny (*N.H.*, viii. 30; xi. 106) mentions the oryx, the Indian ass, and an Indian ox as one-horned; Aelian (*De nat. anim.*, iii. 41; iv. 52), quoting Ctesias, adds that India produces also a one-horned horse, and says (xvi. 20) that the *Monoceros* was sometimes called *Carcazonon*, possibly a form of the Arabic *Carcadān*, rhinoceros.

The mediaeval conception of the unicorn as possessing great strength and fierceness is perhaps due to the fact that in certain passages of the Old Testament (*e.g.*, Num. xxiii. 22; Deut. xxxiii. 17; Job xxxix. 9–10) the Hebrew word *R'ēm*, now translated in the Revised Version "wild ox," was translated in the Septuagint *μονόκερως*, in the Vulgate *unicornis* or *rhinoceros*, and in the Authorised Version "unicorn," though in Deut. xxxiii. 17 it obviously refers to a two-horned animal. Isidore xii. 2, 12 tells how the unicorn has been known to worst the elephant in combat.

As a decoration on drinking-cups it symbolized the ancient belief in the efficacy of the unicorn's horn against poison, which in England remained, even in the time of Charles II., though Sir E. Ray Lankester (*Science from an Easy Chair*, 1910, p. 127) mentions that a cup made of rhinoceros horn was then handed over to the Royal Society for experiment, with the result of entirely disproving the superstition. In the court ceremonial of France as late as 1789 instruments of "unicorn's" horn were still used for testing the royal food for poison.

In heraldry the unicorn was sometimes used as a device (*see* HERALDRY), but oftener as a supporter, and subsists to the present day as the left-hand supporter of the royal arms. This position it assumed at the Union, the Scottish royal arms having been supported by two unicorns. When the unicorn became a supporter of the royal arms both of England and Scotland, a royal crown was added on the head of the unicorn, in addition to the crown with chain and ring round its neck (*see* Great Seal of James I. and VI. in Anderson, Pl. xciii.), but this crown was removed after the Hanoverian succession. In England after the Union the unicorn became the left-hand supporter, but in Scotland, as late as 1766, it was still put on the right (Seton, p. 442).

UNICORN-PLANT (*Proboscidea jussieui*), a North American plant of the family Martyniaceae, called also proboscis-flower and devil's-claw, native from Indiana to New Mexico and southward to Mexico, cultivated for its abundant foliage, peculiarly shaped flowers and oddly formed fruiting pods. It is a

coarse, sticky-hairy, half-prostrate annual, with thick, roundish leaves; large violet or purple flowers, $1\frac{3}{4}$ in. long; and hanging, hornlike, woody pods, with a thick body, 3 in. to 4 in. long, ending in a curved beak of equal or greater length. When dry, the beak splits into two opposed hooklike or clawlike appendages.

UNIDIRECTIONAL RADIO DIRECTION FINDER, a radio device which permits determination of the direction (without 180° ambiguity) of waves as received from a transmitting station.

UNIFIED FIELD THEORY, a term widely applied, early in 1929, to represent the new theory which was then advanced by Albert Einstein, according to which there is but a single background to all material activity—one unified field.

A material object is commonly conceived of as existing in space and time. The scientist often adds that the object is in a gravitational field and in an electromagnetic field. These four terms seem to attribute four different backgrounds to the object. But the special theory of relativity (*q.v.*) has amalgamated space and time into space-time and the general theory of relativity, with its Riemannian geometry, has absorbed the gravitational field into space-time. Thus three of the four terms were already reduced to one.

The unified field theory goes a step further by including the electromagnetic field. For a further discussion of unified field theory as an outgrowth of relativity concepts, *see* RELATIVITY: *Unified Theories.*

UNIFORMS (Lat. *unas,* "one," and *forma,* "form"), distinctive, homogeneous dress worn by naval, military and air services and other bodies.

BRITISH MILITARY UNIFORMS

From Origins to 1768.—The origin of the modern uniform, no doubt, was the armorial bearings and badges of the knight and his retainers. The first permanent body of troops was Henry VII's bodyguard, which exists today as the yeomen of the guard. First dressed in white and green coats, the Tudor colours, embroidered on breast and back with the crown and rose, they continued to wear this livery during the first part of the reign of Henry VIII, who later gave them a new dress of scarlet guarded with black. During the following reigns, the levies raised for various emergencies were frequently supplied with uniform coats of the same colour, sometimes ornamented with guards of coloured lace. During the Great Rebellion this custom continued. It seems, however, that there was no uniformity in the colour of the breeches; even in Cromwell's New Model army, although all were to wear red coats, the breeches were to be "grey or other good colour."

With the return of Charles II began the establishment of the regular army and regimental uniforms. The dress at first was still the short coat and the high-crowned buff-coloured felt hat, which soon gave place to a black one with a lower crown. The coat was made longer, reaching almost to the knees. It served also as an overcoat, which did not form part of the soldier's clothing. Regiments now began to have linings and cuffs of regimental colours, and the fall-down linen collar was replaced by a white neckcloth. Officers wore silk sashes. Sashes of different colours had formerly been used as a means of identification in the field and so became the emblem of military rank. The gorget was almost the last piece of mediaeval armour to be worn. It had now become a small semicircular object fastened round the neck with a ribbon, used as a badge of rank and worn to indicate that the officer was on duty. It survives as the staff officers' tabs.

In 1677 grenadiers were introduced and given a special headdress—a baglike cap with a band of fur. The fur was later replaced by a cloth band and a stiffened front, on which was embroidered the sovereign's crown and cipher or the colonel's crest. The colour of a regiment's breeches and stockings now begins to be mentioned. The former became less voluminous and the stockings were worn pulled over the knees and fastened with a strap and buckle. Shoes and stockings were found impracticable for campaigning in the mud of the Low Countries, and spatterdashes or leggings reaching above the knee were introduced. The wide brim of the felt hat had been looped up on one side, then on two, and finally the three sides were fastened to the crown to form the three-cornered cocked hat. In Great Britain at the end of the 17th century several regiments wore gray coats, the local homespun being the easiest cloth to obtain. These gray uniforms were discontinued by the end of the century, although they continued to be worn in the continental armies, especially by French regiments, who wore light gray uniforms for many years until they changed to those of a definite white cloth.

Cavalry, or "horse" as it was termed at the beginning of the Restoration, wore much the same dress as during the Great Rebellion. The buff coat was still part of its clothing but it became shorter and closer fitting until it developed into the "veste" or waistcoat, still retaining its buff colour. Cuirasses were worn up to 1697–98. The triple-barred helmet was soon replaced by a metal "skull," worn inside the crown of the felt hat as a protection against sabre cuts. Boots at first were made of brown or buff leather, but were soon replaced by the stiff black jack boot with wide tops to protect the legs and knees from being crushed in mounted action. The "horse" wore crimson coats with regimental facings and leather breeches. The dress of Marlborough's army remained more or less the same up to the reign of George II, when he and the duke of Cumberland made serious efforts to standardize regimental uniform. The single-breasted coat was changed to a double-breasted garment with half lapels, buttoned back for full dress or buttoned across for extra protection. The large cuffs were furnished with a laced slash and buttons. The linings, cuffs and lapels were of the facing colour, and each regiment had its own special pattern of lace. This strengthened those portions of the coat liable to extra strain such as the seams, buttonholes, edges of the cuffs, etc. The foot guards wore plain white lace. Nearly all regiments wore red coats and waistcoats, except the foot guards and royal regiments, who wore blue. The outer coat acted as an overcoat. The skirts could be buttoned back for parades or ease in marching, or allowed to fall loose as a protection.

The crowns of the grenadiers' and fusiliers' cloth caps were stiffened with pieces of cane. The fronts were of facing cloth embroidered with the crown and cipher and scrolls or foliage, exceptions being the foot guards and those regiments entitled to special badges. During the Seven Years' War the grenadiers, in imitation of the European regiments, began to cover the front of their caps with fur, which finally developed into the bearskin caps authorized in 1768.

During the campaigns in Canada, 1758–59, provisional light infantry companies were formed. To suit their work in the woods, the long coats were cut down and the sleeves removed, the opening at the shoulders being covered by sewing on wings like the grenadiers. The cocked hats were turned into caps by cutting off the brims and turning up the fronts.

In 1742 both "horse" and dragoons had red coats without lapels, but with buttons and buttonholes on either side. The lace was either plain white or yellow. In 1746, for economy, the first three senior regiments of "horse" after the royal horse guards were transformed into dragoons, the pay of dragoons being less than that of troopers of "horse." As a compensation they were given the title of "guards." The clothing warrant gives the system of dress: "All regiments to have cuffs, lapells, linings, waistcoats and breeches of the facing colour. Horse to have lapells to the bottom of the coat, round cuffs without slashes. Dragoon Guards, lapells to the waist and slit cuffs. Dragoons, no lapells. Only Dragoon Guards and dragoons to wear white or yellow shoulder knots." Horse grenadier guards and Scots grays wore coats like dragoons, and their caps were similar to those of the grenadiers of the infantry. Cavalry cloaks were red with collars of facing cloth, and had "frogs" of the same lace as on the housings. Officers' coats were laced with either gold or silver and a crimson silk sash was worn. The cuirass, which had been laid aside after Marlborough's time, was reissued together with iron skulls to those regiments serving on the continent in 1758. In 1759 regiments of light dragoons were raised, with uniforms similar to those of dragoons with the addition of half lapels.

From 1768 to 1797.—The 1768 warrant made considerable changes in the army's dress. The coats were made closer fitting with fall-down collars and small round cuffs without the slash, the

narrow lapels to the waist still retaining the loops of regimental lace. The linings, waistcoats and breeches were white. The three-cornered cocked hat usually had the front point raised into a more upright position, until finally it took the form of a two-cornered cocked hat. The long white leggings were now changed for black, with black leather tops. The fur cap of the grenadiers was furnished with a black metal plate with the devices in white, the crown at the back still showing the red cloth.

Light infantry had fallen into abeyance until the American Revolution. Their uniform was a short lapelled jacket, red waistcoat, white or buff breeches, stockings and the short spat-shaped gaiters which had come into general use during the war. The headdress was either the felt cap or one of jacked leather with a turned-up front and a black or green feather on the side. The dress of the infantry remained much the same until 1797. Officers began to make the collar stand up, but this was not authorized until 1796. The grenadier caps had white feathers and cap cords added. The battalion companies began wearing a coloured worsted tuft in their hats, officers mostly having black feathers.

Independent companies of highlanders had existed intermittently from 1667, and in 1739 a regiment was formed, later the royal highlanders (Black Watch). The dress was a short red jacket and waistcoat, belted plaid which acted as a cloak, hose and a flat blue bonnet. While the regiment was in Canada in 1759, a piece of black bearskin was fastened to the left side. Later the bonnet was cocked and stiffened, and a bunch of ostrich feathers fastened to the side. Their grenadiers had always worn fur caps. The belted plaid was found to be cumbersome and only the kilt was worn. The original sporran or purse was made of an animal's skin, usually with the hair outside, and had tasselled leather laces.

In 1787 an attempt was made to issue clothing suitable for hot climates, and white round hats were given to the troops serving in the East and West Indies. In 1789 a complete kit was authorized, consisting of a white hat, jacket and trousers. The white hat was replaced by a black one shaped like a silk hat or later a "bowler," and often furnished with a fur crest as an extra protection against the sun. This was also worn by the light companies of the foot guards and the volunteers in 1794.

The style of the coats and hats of the cavalry and dragoons followed much the same changes as those of the infantry. The success of the light dragoons caused more regiments of heavy dragoons to change over. In 1784 their red uniform was changed to a short blue sleeveless jacket and underjacket, both heavily braided with white lace. The headdress was of black leather with a black bearskin crest and a turban of silk or leopard skin. The artillery and engineers in the 17th century came under the master general of the ordnance, the officers being commissioned by him. "The train of artillery," as it was called, was not a permanent force. The uniform of the gunners was red with a cocked hat, although grenadier caps were worn by some. William III's train for his Irish campaign wore blue with orange facings, however.

The red uniforms continued to the end of Marlborough's campaigns. In 1742 blue coats faced red took their place, and in 1778 all ranks wore white breeches and waistcoats, yellow lace having been added to the coats. In 1794 the cocked hat was changed to a flat-brimmed round hat with a tapering crown, the officers wearing the fur-crested hat.

The engineer officers were given their first uniform in 1757. This was scarlet with black velvet facings and was changed to blue with black facings in 1782 and to scarlet with blue facings in 1812. The engineers were a corps of officers only. In 1772 a separate company of military artificers was formed composed of noncommissioned officers and privates. The dress was a red jacket with orange facings and a cocked hat with a black feather. In 1787 blue coats with black facings and laced with yellow were adopted. Dark frocks with round hats were worn for working. After this the artificers, later the royal sappers and miners, followed the same styles as the infantry, although their lace remained yellow.

The success of the galloper guns of the light dragoons in India led to the formation of the royal horse artillery in 1793. Their uniform was at first a blue coat with red lapels and a fur-crested helmet. The coat was soon changed for a short yellow-braided jacket, which continued up to 1823. Their dress then followed the different styles of the light dragoons until 1846, when the hussar busby was adopted.

The drivers of the artillery were originally civilians hired with their horses by contract. In general they wore the smock frock, sometimes with the crown and cipher worked on it. Since they proved unreliable in action, a military unit was formed in 1806, called the corps of royal artillery drivers. Its members wore a helmet and uniform similar to that of the royal horse artillery. In the early days of the artillery it was customary to form a special ordnance regiment which protected the train not only against enemy attacks but also against sudden panic of the personnel. The royal fusiliers, 1685, and the Royal Scots fusiliers, 1677, were two such regiments, the first recording their early duties by the wide artillery stripe on their trousers and the grenade badge. Fusiliers regiments had always worn grenadier caps.

Another driver corps raised in 1794 for the transport was the royal wagoners. They were dressed in red jackets with blue collars and yellow cuffs, blue breeches and a leather cap, the whole inspired by the Hanoverian train. A new corps was raised in 1799 named the royal wagon train, and dressed in blue jackets laced white and faced red, and a fur-crested helmet. In 1811 red jackets with white braid and a shako were approved. This dress with minor changes continued until 1831, when gold lace replaced silver for officers. The train was disbanded in 1833, and a new corps was hastily raised for the Crimea called the land transport corps, the uniform being a blue double-breasted tunic and black slouch hat. Reformed as the military train, it retained the blue tunic, but the facings were white, and a black shako (of French type) with black drooping plume and cap lines was added. This corps developed into the royal army service corps.

From 1797 to 1815.—In 1797 the coat was made to fasten down to the waist, the lapels, except for officers, were removed and replaced with lace loops. The cocked hat had now assumed its largest proportions, the lace edging was removed and a white tuft or feather with a red base became usual. The grenadiers and light infantry retained their white or green plumes. In 1800 a new short single-breasted jacket was introduced. Officers still wore the large cocked hat and the double-breasted lapelled coat; usually buttoned across. The men were given a tall cylindrical cap, first made of lacquered leather and soon changed to felt. It was also worn by the grenadiers and fusiliers when on active service.

During the Peninsular War, officers wore the same cap as the men with a short jacket. The general staff, however, wore the cocked hat, which became much reduced in height. In 1811 a new cap was made with the addition of a high front copied from that worn by the Portuguese troops. The white breeches and gaiters worn at home were replaced by slate-gray trousers and short gaiters in the field. Gray overcoats were issued in 1802. The Highland regiments wore the same type of jacket. The men's bonnets were covered with small feathers, and on service had a leather peak. Because the men lost their shoes in soft ground, short gray gaiters strapped under the instep were worn.

The 60th foot had formed additional rifle battalions from the debris of the various *emigrée chasseur* and German *Jäger* corps taken into the British service during the French Revolution. In 1800 another rifle regiment was formed as the 95th (later the rifle brigade). Both wore the cylindrical cap of the light infantry with a green tuft and bugle horn badge; green jackets with red facings for the 60th, black for the 95th; the first having blue breeches and the second green.

The coats of the cavalry and heavy dragoons followed much the same changes in style and cut as those of the infantry. Red cloth wings were added to the shoulder straps. In 1811 they changed to another short jacket, with bands of lace down the front instead of the bars of lace. It was fastened with hooks and eyes, and a girdle of regimental colours was worn round the waist.

A helmet of black leather with metal comb and mountings replaced the cocked hat. The first pattern had a worsted crest, soon changed to a black horsehair tail in imitation of the French dragoons. The household cavalry, however, retained their red and dark blue worsted crest, and the Scots grays their fur caps. White

breeches and high jack boots were worn in full dress, but on service slate-gray overalls with coloured stripes were worn. These had originally been worn over the white breeches and boots to protect them from being soiled on the march. Later they became an actual garment by themselves.

At the beginning of the 19th century the light dragoons wore the sleeved jacket with white breeches and Hessian boots. Besides their helmets, they wore an undress or watering cap, closely resembling the *mirliton* of the French hussars. In 1811 they changed to a short blue jacket with plastrons of regimental facing colour, a coloured worsted girdle and a shako like the French. In 1805–06 some light dragoons adopted a dress which imitated that of the Hungarian hussars, consisting of a dolman and slung pelisse of blue cloth, both heavily braided, the collar, cuffs and bottom of the pellise being edged with fur. With this a tall fur cap or busby was worn, and a sabretache, used for carrying dispatches, was slung from the waist belt.

From 1816 to 1854.—The poor appearance of the British infantry while stationed in Paris in 1815 in comparison with the Allied troops led to the adoption of a shako copied from that of the French, but having a peak or neck covering at the back as well as the front, which was dispensed with in later patterns. The period following was the most elaborate for the dress of the army. The shako was first adorned with bands of gold or silver lace round the crown and base, then elaborate cap lines were added which terminated in gold "flounders" or flat plaited knots fastened to the breast of the coat. Tall plumes were replaced in about 1835 by ball tufts. The short jacket was replaced by the long-tailed coatee and the Prussian or straight-up closed collar was introduced. The officers' wide lapels of facing colour curved to the waist, and had laced or embroidered buttonholes.

Black gaiters and breeches were abolished in 1822; white trousers were worn in the summer and light blue-gray in the winter, with gold or silver stripe for officers. An almost black cloth called Oxford mixture replaced the light blue, and a red welt was added to it. The white trousers were abolished (except for hot climates) in 1845. The bearskin cap of the grenadiers had been furnished with a leather peak, cap cords and a brass plate, and these were gradually discarded until the cap was of fur only without any embellishments. In 1837 gold lace was to be worn by the regular army only. In 1843 a new shako was introduced, called the "Prince Albert." All bearskin caps except those of the foot guards and Scots grays were abolished. The rifle regiments wore green jackets and pelisses with bell-topped shakos and falling plumes, later changed to ball tufts. The jackets of the Highland regiments were similar to those of the line regiments, but the skirt tails were small and short. The feathered bonnet was at its tallest and the sporran had large gilt fastenings and a long-haired covering with tassels and sometimes gilt fringes.

The heavy cavalry appeared in black japanned metal helmets with brass plates and ornaments, surmounted by large black bearskin crests. The light gray-blue overalls were full in the leg, becoming tight at the ankle in imitation of the Cossack garments, and so named after them. Later they were replaced by dark blue with coloured stripes. The helmet was again changed in 1834 for one similar in shape but of brass. For undress the fur crest could be removed and replaced by a brass crouching lion which fitted over the front and top of the comb. Later a brass helmet with an upright spike with drooping horsehair plume was adopted, resembling that worn by the household cavalry today. The household cavalry, about 1820, wore the same shaped helmet as the heavy cavalry but silver-plated with brass ornaments, and about the same time were again given their cuirasses. A little later, as well as helmets, they were given tall bearskin caps like those of the foot guards, reserved for ceremonial occasions. The dress of the light dragoons was still the short jacket, but the shako was more "bell-topped" with plaited cap lines and flounders, the officers wearing drooping plumes of feathers, the men's being horsehair. The hussars wore similar shakos in place of the busby.

William IV dressed the whole army in red except the royal artillery and rifle regiments. The hussars kept their blue dolmans, but wore scarlet pelisses, and the overalls for all cavalry had now been changed to dark blue. In 1840, the light dragoons, hussars and lancers were again dressed in blue, only the 16th lancers retaining their scarlet jackets. Some hussars retained their shakos and other regiments returned to the fur busby. During the Crimean War the overalls were again strapped with leather, which developed into the booted overall.

From the Crimean War (1853–56) to 1914.—During the Crimean War the coatee was found to give no protection to the loins and abdomen against cold and wet, so a long-skirted double-breasted tunic copied from the French was issued. A year or two later a single-breasted tunic and a more conical and lighter shako were issued. In 1869 the slashed cuff became pointed and the skirts of the tunic were made plain except for two white pipings.

Under the Cardwell system (see GREAT BRITAIN: *Defense*), to facilitate changing the facings of a man transferred from one linked battalion to another, the tunic was made red throughout, with only a patch of facing cloth sewn over the collar and cuffs. In 1870 the crown was worn on the men's collars and the regimental badge was placed on the shoulder strap. The crown, however, soon gave place to the regimental badge. In 1874 trousers of dark blue cloth instead of Oxford mixture were issued.

After the Crimean War the tunic was given to all cavalry regiments, the dragoons guards keeping their helmets of brass while dragoons were given helmets of white metal. Regiments began to have plumes of various colours. Light dragoons wore an upright shako, but changed to the French type with drooping plume. The royal artillery changed from the busby to the helmet in 1878, the horse artillery, however, still kept theirs. The royal engineers wore the busby up to 1870, when its shape was changed to one similar to that worn by rifle regiments, and in 1878 the helmet was adopted. After World War I there were changes in full dress. The royal artillery, royal engineers and royal corps of signals were again given the busby, the engineers having a blue bag and white plume, the corps of signals a red plume. The royal tank regiment was given a blue uniform with black facings.

Undress and Service Dress.—The forage cap of the mid-18th century consisted of a soft loose bag surrounded by a band of cloth, made from pieces of the old discarded coat. A similar cap was worn in the French army and developed into the *bonnet de police*, which came into use in the army unofficially about 1855 and was the origin of the folding service cap of 1870. During the 19th century a soft round cap made its appearance, which the foot guards in due course stiffened into the "pillbox," the cavalry, artillery and other corps following the same style. The infantry, on the other hand, wore the "pork pie"-shaped Kilmarnock with "touris" of different colours according to whether they were flank or battalion companies. This was replaced by the Glengarry, and in turn by the folding service cap, also worn by the cavalry and different corps in various colours according to regiment. At the end of the South African War the soft round cap of the 19th century reappeared and was known as the Broderick cap; sidepieces were added which could be let down as ear coverings. This was a replica of the "Marie Louise," worn by Napoleon's 1813 conscripts. Later this was stripped of its sidepieces, given a glazed leather peak and stiffened into the modern form. For field work a serge coat called a frock was worn with short leather gaiters over the blue trousers. Officers for many years had worn blue frock coats which were eventually authorized.

Khaki (dust colour) or a drab service dress was worn in the Indian mutiny. The 74th highlanders during the Hottentot campaign of 1851 wore canvas frocks dyed a dark olive brown, and gray coats were also worn in Egypt, 1882–85, and in the Ashanti campaign, 1873. These, however, were not the earliest service dress of gray, as W. Hollar shows officers of the Tangier garrison in gray. Khaki became the universal service dress, worn with trousers or breeches and a topee or sun helmet. Sun helmets began to be worn in India; some of the first had a hollow comb or crest, the front of which was open. During the South African War the colonial slouch hat began to be worn by regular regiments. The cavalry in India began to wear chain mail on their shoulders, said to have originated from an officer's sewing curb chains onto his shoulder straps as a protection against sword cuts

in the Afghan War. The modern battle dress of blouse, trousers and the resuscitated short gaiters, replacing the breeches and puttees which had been worn for a number of years, was evolved from various experiments before 1939. The steel shrapnel helmet was introduced during World War I, but the French had already given their artillery a steel helmet in 1902. After World War II, full dress, except for the household brigade and the king's troop, royal horse artillery, was declared obsolete. The only form of dress remaining to the army, therefore, was battle dress. The severity of this uniform was mitigated somewhat by the introduction, for other ranks, first of khaki collars and ties and second, and for more formal occasions, of a blue beret. At the same time the peaked forage cap was reintroduced for officers, while the wearing of swords and the prewar pattern service dress for ceremonial parades was made permissive.

It was intended, however, to equip the army with a blue uniform, described officially as no. 1 dress. This was modelled, largely, on the prewar officers' undress, or patrol jacket, with a stand-up collar, and was to be worn with a red sash. Regiments and corps would be distinguished by coloured piping on the shoulder straps and also by the colouring of the trouser stripes. This was to be worn with a blue forage cap, regiments and corps, in many instances, being distinguished by a difference in the colour of the hatband. The uniform was to be green for rifle regiments, while the style of the jacket was modified for Scottish regiments. The introduction of no. 1 dress was to be spread over a number of years, but an early issue was made to bands. It was also provided for all detachments taking part in the coronation parade of 1953, but thereafter was issued on a rank basis.

Officers wore the Sam Browne belt with no. 1 dress, but for ceremonial occasions they were to wear a uniform known as no. 1 (ceremonial) dress. This consisted of the substitution of gold shoulder cords in place of the cloth shoulder straps on the no. 1 jacket and of a red sash instead of the Sam Browne belt. The sword would be carried in a plated scabbard suspended by gold sword slings, the hilt of the sword being decorated with a gold sword knot. For general officers, the general officers' pattern sword was restored, together with the gold and scarlet waist sash.

Women's Army Services.—Excepting the nurses of the military hospitals, the first British women's service unit appears to have been the First Aid Nursing yeomanry (F.A.N.Y.) formed at the end of the South African War. As this was a mounted unit, the dress was a scarlet tunic with white braid, blue riding habit with scarlet band and blue peaked cap. The uniform is now a khaki jacket and skirt.

The Women's Army Auxiliary corps (W.A.A.C.), formed in 1915, wore a khaki dress, coat and soft felt hat. When the title was changed to Auxiliary Territorial service (A.T.S.), a khaki uniform of tunic, skirt and peaked cap was worn, a flat service cap of brown and orange piped with green was also allowed. After World War II the service became the Women's Royal Army corps, and the uniform was changed to dark green with a green beret for the privates, but a peaked cap was worn by officers.

BRITISH NAVAL UNIFORMS

Although no regular dress was laid down for seamen, a naval costume had evolved from the requirements of a seafaring life. From very early days clothing or livery had been provided for officers and men. Chaucer's seaman, in the 1480 edition of his *Canterbury Tales,* is shown wearing a sea gown of russet colour girt with a belt from which hang a knife and a leather wallet, and a loose red cap apparently edged with fur. The Cinque Ports in 1513 wore white coats with a red cross and "the arms of the Portis underneath, that is to say a halfe lyon and the halfe shippe." Elizabethan seamen are occasionally depicted. One book shows a master, 1590, wearing a loose cassock and full Venetian breeches, stocking and shoes and a fur or thrummed cap. Blue seems to have been often the colour of the jackets. The six principal masters of the king's ships in 1604 had the grant renewed for red livery coats guarded with velvet and embroidered with the crown, roses and ships.

The slop lists of 1663 mention red caps, Monmouth caps, stockings blue and white, shirts, cotton waistcoats and drawers, canvas suits and blue neckcloths. In 1690 wide canvas breeches striped crosswise with red are described; under these, canvas breeches fastened at the knees were worn. In 1706 orders were issued regarding the slop clothing to be supplied, which mention "grey Kersey jackets lined with red cotton with brass buttons, the button holes stitched with gold colour thread, red waistcoats, red breeches, shirts of blue and white checkered linen, leather caps faced with red cotton and shoes with brass buckles."

The officers of the "Kent" in 1748 all wore silver-laced gray coats faced with red. In 1748 a uniform was established for officers. It was to be blue faced with white, but as no details were issued, officers found great difficulty in closely conforming to it. The portraits of Lord Anson and Admiral Byng show them in blue gold-laced coats, with wide white cuffs but no lapels, while Admiral Boscawen's portrait shows a very similar uniform but with wide white lapels with gold-laced loops. The waistcoats in all three cases are white with wide gold lace, the breeches blue. With this the gold-laced cocked hat was worn.

In 1767 and 1774 more definite instructions were issued. The coats were to have narrow white lapels to the waist, white cuffs, white waistcoats and breeches, the master and commander having blue lapels, the midshipman none. Rank was also denoted by the buttons being placed at regular intervals or by twos or threes. In 1783 rank was indicated by the rows of lace on the white cuffs of the full-dress coat and on the blue lapels of the frock by the arrangement of the buttons. In 1787 a uniform was authorized for warrant officers, which included masters, physicians, gunners, boatswains and carpenters, consisting of a blue coat with blue turned-down collar and cuffs.

Epaulettes were authorized in 1795. The ranks of admirals were indicated by one or more silver stars on their epaulettes. Hessian boots with white or blue breeches began to be worn about 1800.

About the middle of the 18th century the gray coats and red breeches of seamen began to give place to blue jackets, red or buff waistcoats, white breeches and canvas petit-coat trousers. The headdress was a tarpaulin hat with the brim tacked up or left flat or a felt hat with a bunch of blue ribbons. A blue Kilmarnock cap with a red touri was also worn. The modern cap was eventually evolved from this, the French seamen still wearing it with its original red touri, now a pompon.

From 1800 onward a tarred or painted canvas or leather cap edged with fur is shown in contemporary prints and paintings; this may have been a cap with fur-lined ear flaps. A hat of the "topper" shape, sometimes of straw, with a ribbon band is also depicted. In 1834 it is shown glazed, with a more conical crown, and the ship's name painted in it; after this a lower crowned black hat with a wider brim appears.

The men's jackets had become shorter and were often strengthened with strips of canvas sewn along the seams. The cuffs from the early days are shown slashed and with three or four black buttons. There was at first no collar, but coloured or black handkerchiefs were worn round the neck. About 1823 the jacket is shown with a turn-down collar, the blue and white striped collar of the shirt being worn over it. The waistcoat is blue and the trousers plain white or blue.

New regulations were issued in 1825–27. The coats of officers were to have wide white lapels and cuffs, all laced with gold. High-ranking officers were to have their badges of rank on their epaulettes; masters, physicians, secretaries, pursers, etc., blue coats, lapels and collars, with blue twist buttonholes. Each branch was indicated by distinctive badges on the collar, *e.g.,* masters, three anchors; physicians, anchor and serpent; secretaries, crown and anchor; pursers, crossed anchors. The frock dress was all plain blue with turn-down collar. Cocked hats were worn fore and aft, but black glazed round hats and short jackets could be worn at sea. Undress caps were flat round caps with a wide top and black peak.

Seamen's dress had become standardized, the striped shirt collar being blue with two or more white stripes. The senet hat, sometimes painted black, was worn, or the Scotch cap, which developed into the soft edition of the modern cap. In 1857 this

dress was officially authorized, the blue collar was ordered to have two white tapes, but the men preferred three as more decorative, and so were allowed to retain them. In 1863 the curl was added to the top row of the lace on the cuffs of the executive officers, and later granted to all officers. Coloured stripes were added to the cuffs indicating the different branches of the service, the buttons on the single-breasted coatee being placed in twos with a white stripe for paymasters, threes and scarlet stripe for surgeons and fours and purple stripe for engineers. The men's blue jackets, the straw senet hats and the cocked hats and tail coats of the officers were later abolished.

By 1955 naval officers' standard day uniform for all occasions was the double-breasted reefer jacket and trousers, with peaked cap. Commissioned officers wore horizontal bands of gold distinction lace on the sleeve—one row and curl for a sublieutenant, four rows and curl for a captain, one broad row and four ordinary rows with curl for an admiral of the fleet. Full dress was in abeyance. For ceremonial dress officers wore medals and orders instead of medal ribbons. Ratings wore blue serge or cloth suits for full dress and blue serge blouse and trousers as normal working dress.

Women's Royal Naval Service.—The Women's Royal Naval service (W.R.N.S.), formed in 1917, wore blue jackets and skirts with a soft blue felt hat, changed during World War II to the seamen's cap, the officers wearing hats with the brims curled up to form a tricorne hat.

Royal Marines.—The maritime regiment of 1664 wore coats of a yellow colour with red facings, breeches and stockings. The regiment of 1684–89 had red coats faced yellow, gray breeches and white stockings. The next description is of red coats and grenadier caps. In 1742 the ten regiments of marines had various coloured facings according to the regiment. The fronts of the caps were different in shape from those of the grenadiers. At about 1750, the cap was the usual grenadier type with a white front on which was embroidered an anchor. The half lapels were edged and looped with a white lace with blue and red stripes. The dress resembled that of the infantry until 1802 when the glazed round hat replaced the cocked hats and flank company caps, and the white facings changed to blue when the marines became a royal corps. In 1804 an artillery branch was added and wore the same dress as the rest of the corps, a short blue fatigue jacket with red facings was, however, allowed. From 1820 the blue uniform was given, which was almost the same as that worn by the royal artillery. In 1923 the artillery were amalgamated, the whole corps wearing the scarlet tunic.

After World War II marines wore blue serge or khaki, but for working battle dress was worn, and for mess dress, scarlet mess jackets. Full ceremonial dress consisted of blue tunics with medals or orders.

ROYAL AIR FORCE

The royal flying corps when formed in 1913 wore khaki tunics, which fastened down the right side of the chest, the breeches, puttees, and flat folding service cap being also khaki. The royal air force wore blue-gray tunics, breeches and puttees (later trousers) with a peaked cap, the officers for full dress wearing a leather cap with turned-up fur flaps, a gold and blue-gray plaited cap cord and a blue-gray plume, the whole based on the cap worn when flying.

After World War II, full dress was in abeyance; for ceremonial occasions a gold belt and sword were worn with service dress.

The dress of the Women's Royal Air force (W.R.A.F.) is a blue-gray tunic and skirt, blue-gray collar, black tie and peaked cap.

BIBLIOGRAPHY.—C. C. P. Lawson, *A History of the Uniforms of the British Army, From the Beginnings to 1760*, 2 vol. (London, Toronto, 1940–42); C. N. Robinson, *The British Fleet* (London, 1894); Society of Army Historical Research, *Journal* (London, 1921–).

(C. C. P. L.)

UNITED STATES

All the U.S. services, army, navy (including marine corps) and air force, have service uniforms for summer and winter and dress uniforms. Also special clothing and uniforms are authorized for individuals whose duties so require (*e.g.*, cooks and bakers; members of the army medical service, armed services police, personnel stationed in areas of extreme climatic conditions, etc.). Special clothing is also authorized for wear while engaging in sports.

Army.—*Service Uniforms.*—The army service uniform is of two types—an olive drab wool uniform for winter and a cotton or other fabric in khaki colour for summer. The coat is single-breasted, lapel design, with four buttons and four pockets (two patch breast pockets and two inserted lower ones), all covered with flaps. The winter coat has a matching cloth belt with a gold colour buckle. The winter trousers are of a lighter shade than the coat while the summer trousers are of the same colour as the summer coat. A service cap with leather visor or a garrison cap with cord edge braid is authorized for both uniforms. An overcoat is authorized for winter wear. Russet colour low quarter shoes are authorized for normal wear. Combat boots of the same colour are worn under combat or simulated combat conditions. The shirt is khaki and the necktie is olive drab.

Blue Dress Uniform.—The blue dress uniform is for winter wear. The coat is single breasted, with two upper and two lower inverted pockets, covered with flaps. The coat has shoulder straps on which insignia of grade and branch colour appear. The coat and cap are of matching dark blue material. The cap visor for officers above the grade of captain is embroidered in gold with groups of gold leaves. The trousers are sky blue, except those for general officers, whose trousers match the coat. The shirt is white; necktie is black four-in-hand type.

White Dress Uniform.—The white dress uniform is for summer wear. It is of cotton twill or duck. The design is in general the same as that of the blue dress uniform. Shoes, shirts and socks are white; the tie is black.

Mess Uniforms.—The blue mess uniform (for winter) consists of the mess jacket, trousers and cap of dark blue wool. Gold colour shoulder knots are on the jacket. The vest is of white pique; tie is black, bow, with square ends. Shoes and socks are black. The white mess uniform (for summer) is of the same design as the blue mess.

Evening Dress.—Coat and trousers are of blue-black or black commercial type, tailed coat with army buttons, ornamentation and insignia. The wing collar is white; civilian commercial-type socks and shoes are black. Gloves are white. The cap matches the coat and trousers. The vest is single breasted, low cut, of white pique or other conventional-type commercial evening dress vest material.

Combat; Work Details.—For combat and for working parties where the service uniform would be inappropriate, a "fatigue" or "utility" uniform consisting of olive drab cotton jacket and trousers is issued.

Uniforms for Women.—The women of the army have service, semidress and dress uniforms. The service and semidress uniforms are taupe in colour; the dress uniform is white. The uniform consists of a cotton dress (for summer service), coat, skirt, hat (or cap), shirtwaist, shoes and handbag. The evening dress consists of dark blue skirt, jacket, white blouse and tiara.

Navy.—The U.S. naval officer's uniform in general corresponds to that worn by the officers of the various navies of the world. They are made readily distinguishable by the ornamentation, trimmings and insignia.

The dark blue uniform consists of a double-breasted wool sack coat, trousers without cuffs, white shirt, white cap cover, black belt, black tie and black shoes.

The white and khaki uniforms, worn in summer, are made of tropical worsted or cotton material. Khaki belt, shirt and cap cover and brown shoes and socks are worn with the khaki uniform. White shirt, cap cover, shoes and socks are worn with the white uniform.

The uniforms worn by enlisted men of the U.S. navy consist, in general, of the seaman's overshirt or jumper, with trousers that flare slightly at the bottom and a cap. Blue wool and white cotton uniforms are authorized.

The evening dress uniforms are similar to civilian dress with

the exception of the ornamentation, buttons and insignia.

The women have summer and winter service, semidress and dress uniforms. The uniforms are blue or white. The uniforms consist of cotton dress (for summer), skirt, blouse, hat (or cap), handbag and shoes.

The marine corps service uniforms are green (for winter) and khaki (for summer). The dress uniforms are blue; the coat, with a stand-up collar, is of a darker shade than the trousers. The women's uniforms are of green or white.

The uniforms of the military sea transportation service are, in general, of standard navy pattern. However, the insignia, buttons, etc., are distinctive to this service.

Air Force.—The air force winter uniform is of blue and the summer one is tan. The uniform consists of a single-breasted coat, trousers and service cap with a leather visor. The flight cap (oversea type) and a single-breasted jacket are authorized for optional wear. Shoes are black; neckties and belts are dark blue. The overcoat is blue. The raincoat is single-breasted box-style model of dark blue nylon-rayon. Shirts are blue for winter or tan for summer.

The evening dress uniforms are similar to civilian dress with the exception of the ornamentation, buttons and insignia.

The women have summer and winter service, semidress and dress uniforms. The uniforms are tan, light blue or white. The uniforms consist of cotton dress (for summer), skirt, blouse, hat (or cap), handbag and shoes. The service cap is designed so that removable and interchangeable crown covers may be worn (gray for winter service uniform; cotton cord, blue, white and white stripe with summer uniform and white with white dress uniform). A blue wool flight cap is authorized for optional wear.

(A. E. Du.)

UNION, a town of South Carolina, U.S., the county seat of Union county; 65 mi. N.W. of Columbia, on federal highway 176, and served by the Buffalo, Union-Carolina and the Southern railways. The population was 9,730 in 1950 and 8,478 in 1940 by the federal census.

Union is in the beautiful Piedmont region, near the foot of the Blue Ridge, and is one of the important textile-manufacturing centres of the state, with large cotton mills.

UNION CITY, a city of Hudson county, New Jersey, U.S., ¼ mi. W. of the Hudson river, opposite New York city, on high ground above Weehawken, between Hoboken and West New York. Railroad facilities are provided through Hoboken, Weehawken and Jersey City.

Pop. (1950) 55,537; (1940) 56,173. Manufactures include silk, cosmetics, paper and incandescent light bulbs.

Union City was formed in 1925 by the consolidation of Town of Union (incorporated 1864) and West Hoboken (incorporated as a town in 1884), which in 1920 had populations of 20,651 and 40,074 respectively.

UNIONIST PARTY: *see* Conservative Party, British.

UNION LEAGUE OF AMERICA, THE, was organized by a group of Ohio Republicans in 1862 when the Union armies were meeting defeat after defeat and the Democratic party was winning an uncomfortable number of local elections. Its purpose was to inspire "uncompromising and unconditional loyalty to the Union." It was to combat the Copperheads and other subversive groups and infuse new vitality into the slipping Republican party.

The movement caught hold and spread rapidly to other states. It reached its most effective form in Philadelphia and New York city where it became a social as well as a political organization. Within a year it had spread to cities as widely separated as Boston and Chicago, and something of a loose federation had been developed between the different leagues. As time went on, the social idea became more and more important, but the membership continued to be primarily Republican.

As the Union armies moved southward in the last years of the war, the league followed them with teachers and organizers. Its efforts were concentrated primarily on the Negro. Military companies were organized and their expenses paid; supplies were sent to the field, and political literature distributed. Even a few dissatisfied southern whites were attracted to the organization.

Its chief importance, however, came at the close of the war when talk of giving the Negro the vote and of disenfranchising the southern whites began to be heard. Officers of the Freedmen's bureau and northern adventurers in the south quickly saw the league as an agent both for spreading propaganda in favour of Negro enfranchisement and for controlling that vote if secured. State councils were created and a Grand National council set up in New York. A lobby was organized in Washington to support the radical reconstruction program and to oppose the more liberal efforts of Pres. Andrew Johnson. Tales of southern mistreatment of the Negro were widely circulated, and the impression was created that the Negro's future welfare depended entirely on his right to vote. Activities in the south were stepped up and membership rapidly increased in every state. The great object became one of creating a powerful Republican party in the south which, in combination with the northern wing, would ensure continued national success.

In its first days league membership in the south had been made up largely of white men—northern officials, carpetbaggers and southerners who had opposed secession or had fallen out with the Confederate government. Gradually, as the Negro gained the vote, southern whites withdrew and membership consisted almost entirely of Negroes under the direction of a few white politicians. By appeal to racial pride, past injustices and the chance for group activities, the league provided the kind of organization needed to bind the Negro to the Republican party and to hold him in line. Its nocturnal meetings were secret with armed guards to drive away intruders. It initiated members with elaborate ceremonies in which an altar, the Bible, the flag, the Declaration of Independence and the constitution all came into play. To give a more practical turn, the sword, the ballot box, the shuttle, the anvil and other implements were introduced. Then, while members sang patriotic songs, the new members pledged their lives and fortunes to the preservation of liberty and union, the protection of each other, the maintenance of the constitution, the observance of the duties of citizenship and the support of those who did likewise. Then the password and the signs by which members could recognize each other were revealed.

The league proved a very effective political agent and played an important part in southern affairs from 1866 to 1869. After that it declined rapidly as the Negroes and their white leaders quarrelled over the spoils of office and discipline became too harsh. It had, however, done its part in bringing the Ku Klux Klan into being, put a heavy strain on race relations and brought the harsh reactions against Negro voting in the years after 1890.

UNION OF SOVIET SOCIALIST REPUBLICS, THE: *see* Russia.

UNION PACIFIC RAILROAD extends from the Missouri river at Council Bluffs, Omaha, St. Joseph and Kansas City, via Denver, Cheyenne, Ogden and Salt Lake City, to Los Angeles, to Portland, Ore., and to Seattle on Puget sound (and in connection with the Southern Pacific, to San Francisco and central and northern California). The railroad, a Utah corporation, at mid-20th century operated 9,756 mi. in 13 states. Including sidings, the total trackage was nearly 16,000 mi. The main line between Council Bluffs and Salt Lake City, 1,027 mi., is double tracked, as are several of the branch sections. The railroad owned, in 1950, about 1,500 locomotives, including 530 diesel-electrics ("A" and "B" units) and 1 experimental gas turbine-electric. In addition there were approximately 1,200 passenger cars and 55,000 freight cars. The original company was incorporated in 1862 under an act of congress providing for the construction of a continuous line of railroad from the Missouri river to the Pacific ocean, as a measure of military protection, and for the preservation of the union. The connection of the line with the Central Pacific at Promontory, Utah, approximately 53 mi. W. of Ogden, May 10, 1869, completed this first transcontinental railroad. The occasion was marked by ceremonies during which a golden spike was driven into the joining tie.

Although the company expanded rapidly to a route length of more than 7,000 mi. by 1893, it was struck by the business depres-

sion of that year and went into receivership. The government and other mortgages were foreclosed.

In the reorganization by E. H. Harriman and associates, the full amount of principal and interest of the government mortgage was repaid, and the other outstanding mortgages refunded. The present company, incorporated July 1, 1897, assumed operation Feb. 1, 1898. (W. M. Je.; X.)

UNION SECURITY: *see* CLOSED SHOP.

UNIONTOWN, a city of southwestern Pennsylvania, U.S., 50 mi. S. by E. of Pittsburgh, the county seat of Fayette county; on federal highway 40, at an altitude of 1,020 ft. It is served by the Baltimore and Ohio and the Pennsylvania railways. Pop. 20,471 in 1950; 1940, 21,819 by the federal census.

A government airport and a commercial landing field are nearby. A village was laid out there in 1776 on land belonging to Henry Beeson. It was incorporated as a borough in 1796, as a city in 1916 and has a commission form of government. On federal highway 40, 8 mi. E. of Uniontown, a monument marks the spot where Gen. Edward Braddock died and was buried after his defeat by the French and Indians in 1755. Two miles farther east is the site of Ft. Necessity, built by Washington in 1754.

UNITARIANISM, a system of Christian thought and religious observance, deriving its name from its doctrine of the single personality of God the Father, in contrast with the Trinitarian conception of His threefold being as Father, Son and Holy Spirit. The significance of the movement, however, is imperfectly indicated by its name and its true importance lies in its undogmatic approach to religious questions and its teachings concerning God, man, the nature and work of Jesus Christ and the sources of religious belief.

Origins.—The greatest single influence which led to the origin and growth of Unitarian Christianity was the free and independent study of the Bible in the Reformation and post-Reformation period. Criticism of the orthodox doctrine of the Trinity was voiced by a few advanced thinkers, the most notable of whom was Michael Servetus (1511?–53), who was put to death for his heretical opinions at the instigation of John Calvin. Other outstanding names were Laelius Socinus (1525–62) and Faustus Socinus (1539–1604) and by the 17th century Unitarian communities had been established in Poland (now extinct) and in Transylvania. Sporadic antitrinitarianism was also to be found in England during the 16th and 17th centuries and was again the product of independent judgment in the interpretation of Scripture. John Biddle (1615 or 1616–62) is known as the "father of English Unitarianism" and during the Commonwealth organized meetings for worship and the study of the Bible.

Unitarian Church Life.—As a consequence of the Act of Uniformity of 1662, more than 1,700 clergymen of the Church of England were deprived of their livings. It was among dissenting ministers and congregations for whom chapels were built in the years that followed the Toleration act of 1689 that Unitarian church life had its beginnings although the act excluded Unitarians from its provisions. Although these chapels were almost always orthodox at the start, during the 18th century many of them came to adopt Unitarian opinions. This was made possible through the freedom which was allowed by their principle of nonsubscription to human creeds. Hence it was that approximately a third of the 325 Unitarian congregations existing in the British Isles in the mid-1950s had a continuous history from the last quarter of the 17th century. Many of the traditional doctrines of orthodox Christianity such as the Trinity, inherited guilt, eternal punishment and vicarious atonement were either abandoned or regarded as nonessential to the Christian life. The most characteristic movement of thought was that which saw "Arian" or "Socinian" views of the person of Jesus Christ develop into acceptance of him as a purely human figure, though still central to the spiritual and devotional life. The rapid crystallization of Unitarian opinion at the end of the 18th century was mainly due to such commanding figures as Joseph Priestley (1733–1804), Theophilus Lindsey (1723–1808) and Thomas Belsham (1750–1829). Lindsey, after withdrawing from the Church of England, opened in Essex street, London, the first Unitarian chapel specifically so named. Although penal laws against those who impugned the doctrine of the Trinity were not repealed until 1813, Unitarian societies for the spread of literature and mission work had been formed in 1791 and 1806. Together with the Association for Civil Rights of 1819 these were amalgamated in the British and Foreign Unitarian association of 1825 as the first effective consolidation of Unitarian interests.

Changing Bases of Belief.—At the beginning of the 19th century Unitarian Christianity was, broadly speaking, a biblical religion, accepting miracles, and rejecting creeds, not as incredible, but as nonbiblical, resting its hopes on an external revelation and attaching little importance to what it regarded as the uncertain influences and promises of "natural religion." This position was radically changed by the development of scientific knowledge and biblical and historical criticism, aided by the influence of new teachers and thinkers. As a result of the work in the United States of W. E. Channing (1780–1842) and Theodore Parker (1810–60) and, in England, of J. J. Tayler (1797–1869), J. Hamilton Thom (1808–94) and, above all, James Martineau (1805–1900), Unitarianism became a spiritual religion which finds its supreme authority in religious history and experience, interpreted by the reason and conscience of mankind. It welcomes the findings of modern biblical criticism and seeks to understand non-Christian religions and to co-operate with them.

The 20th Century.—The 20th century witnessed further developments of Unitarian Christianity in organization and thought. The deeply felt need for more effective corporate union was met by the formation in 1928 of the General Assembly of Unitarian and Free Christian Churches, which comprised all the principal related denominational organizations. The principles of nonsubscription to creeds and private judgment were steadfastly maintained and no official statement of belief binding upon all adherents has ever been issued. Unitarians and Free Christians are bound together by a common purpose, which has found concise expression in a statement adopted by many congregations: "In the love of truth, and in the spirit of Jesus Christ, we unite for the worship of God and the service of man." Changes in the contemporary spiritual and intellectual climate led to the appointment by the assembly of a Commission on Doctrine which published its findings in 1945 in a volume entitled *A Free Religious Faith.* This contains a series of papers by several writers on the beliefs which are commonly accepted by most Unitarians, though it is in no way an authoritative statement of those beliefs. (F. Ky.)

UNITED STATES

Unitarianism in the United States followed essentially the same development as in England, and passed through the stages of Arminianism, Arianism, antitritheism, to rationalism and a modernism based on a large-minded acceptance of the results of the scientific and comparative study of all religions. As early as the middle of the 18th century Harvard college represented the most advanced thought of the time, and a score or more of clergymen in New England were preaching what was essentially Unitarianism. The most prominent of these men was Jonathan Mayhew (1720–66), who was pastor of the West church in Boston, Mass., from 1747 to 1766.

The first official acceptance of the Unitarian faith on the part of a congregation was by King's chapel in Boston, which settled James Freeman (1759–1835) in 1782, and revised the Book of Common Prayer into a mild Unitarian liturgy in 1785. Unitarian congregations were organized at Portland and Saco, Me., in 1792 by Thomas Oxnard; in 1800 the First church in Plymouth, Mass., accepted the more liberal faith. Joseph Priestley came to the United States in 1794 and organized a Unitarian church at Northumberland, Pa., in the same year, and one at Philadelphia in 1796. His writings had considerable influence. Thus from 1725 to 1825 a more tolerant belief was developing in New England, and to some extent elsewhere.

William Ellery Channing was settled over the Federal Street Congregational church, Boston, 1803; and in a few years he became the leader of the Unitarian movement. At first mystical rather than rationalistic in his theology, he took part with the "Catholic Christians," as they called themselves, who aimed at

bringing Christianity into harmony with the progressive spirit of the time. His essays, "The System of Exclusion and Denunciation in Religion" (1815) and "Objections to Unitarian Christianity Considered" (1819), make him a defender of Unitarianism. The Unitarian movement grew slowly; and its influence has been chiefly exercised through general culture and the better literature of the country. Many of its clergymen have been trained in other denominations; but the Harvard divinity school was distinctly Unitarian from its formation in 1816 to 1870, when it became an unsectarian department of the university. By 1950 there were four colleges and seminaries and two preparatory schools associated with the Unitarian denomination. One of the oldest Unitarian schools is Meadville Theological school, founded in Meadville, Pa., in 1844 and moved to Chicago, Ill., in 1926.

Periods of Unitarian Thought.—By mid-20th century Unitarian thought in the United States had passed through three periods. The first, from 1800 to 1835, was formative, mainly influenced by English philosophy, semisupernatural, imperfectly rationalistic, devoted to philanthropy and practical Christianity. Channing was its distinguished exponent. The second, from 1835 to 1885, profoundly influenced by German idealism, was increasingly rationalistic, though its theology was largely flavoured by mysticism. The leaders of this second period were Ralph Waldo Emerson and Theodore Parker.

The third period, beginning about 1885, was one of rationalism, recognition of universal religion, large acceptance of the scientific method and ideas and an ethical attempt to realize the higher affirmations of Christianity. It was marked by harmony and unity to a degree found in perhaps no other religious body, by steady growth in the number of churches and by a widening fellowship with all other progressive phases of modern religion. During this period the influence of Emerson became predominant.

An International Council of Unitarian and Other Liberal Religious Thinkers and Workers was organized at Boston on May 25, 1900, "to open communication with those in all lands who are striving to unite pure religion and perfect liberty, and to increase fellowship and co-operation among them." In 1910 this organization became the International Congress of Free Christians and Other Religious Liberals, and in 1930, the International Association for Liberal Christianity and Religious Freedom. This organization by mid-20th century had correspondents in 22 countries.

Beyond its own borders the body has obtained recognition through the public work of such men as Henry Whitney Bellows and Edward Everett Hale, the remarkable influence of James Freeman Clarke and the popular power of Robert Collyer. By mid-20th century the number of Unitarian churches in the United States and Canada was more than 370, with more than 500 ordained clergy including a number of women. Church membership exceeded 92,000. The periodicals of the sect are *The Christian Register* and the *Wayside Community Pulpit*. (J. H. L.; X.)

UNITED CHURCH OF CHRIST: *see* CONGREGATIONALISM: *United States*.

UNITED FREE CHURCH OF SCOTLAND, a religious organization, representing the union made in 1900 between the Free Church of Scotland (except a dissentient section which separated and retained the name of Free Church) and the United Presbyterian Church. (*See* FREE CHURCH OF SCOTLAND and UNITED PRESBYTERIAN CHURCH.) The Free Church brought into the union 1,077 congregations, the United Presbyterians 599; the revenue of the former amounted to £706,546, of the latter to £361,743.

The minority of the Free Church which had refused to join the union lost no time in testing the legality of the act of the majority in entering it. Their summons, dated Dec. 14, 1900, claimed that in uniting with the United Presbyterian Church, which did not hold the principles of the Free Church, the majority had forfeited the right to the property of the Free Church, which must be judged to belong to the minority who remained faithful to the principles of the Free Church and were that church. In the Scottish courts the case was decided in favour of the union on Aug. 9, 1901, and on July 4, 1902; but, on appeal, the house of lords, on Aug. 1, 1904, by a majority of five to two, reversed these decisions and found the minority entitled to the funds and property of the Free Church.

Few legal decisions have occasioned such great consternation or such serious practical difficulties. At first sight it deprived the majority of the Free Church section of the United Church of all its material goods—churches, manses, colleges and missions, even of the provision for the old age of the clergy—and handed them over to a body which could have little prospect of making effective use of them. Nothing remained but to invoke the intervention of parliament to put an end to an impossible situation. In December a commission was appointed, consisting of Lord Elgin, Lord Kinnear and Sir Ralph Anstruther, to inquire into matters connected with the two churches, while the question of interim possession was referred to Sir John Cheyne, as commissioner, for inquiry and action.

The commission sat in public and in their report (April 1905) said that the state of feeling on both sides had made their work difficult. They had concluded, however, that the Free Church was unable in many respects to carry out the purposes of the trusts, which, under the verdict of the house of lords, was a condition of their holding the property, and that there was a case for parliamentary interference. They recommended that an executive commission should be set up by act of parliament in which the whole property of the Free Church, as at the date of the union, should be vested, and which should allocate it to the United Free Church, where the Free Church was unable to carry out the trust purposes. The Churches (Scotland) act, which gave effect to these recommendations, was passed on Aug. 11, 1905.

In Oct. 1929 most of the United Free Church reunited with the Church of Scotland. The joint group was renamed the Church of Scotland. At mid-20th century the combined organization was composed of a general assembly, 12 synods and 66 presbyteries in Scotland, 1 presbytery in England and 3 in continental Europe. There were 2,360 congregations with 1,300,000 members and 2,900 Sunday schools with more than 300,000 scholars and teachers. Including natives, there were about 13,000 agents in the church's foreign missions, which had an annual income of more than £1,000,000.

The church was affiliated with four Scottish universities: Edinburgh, Glasgow, Aberdeen and St. Andrews.

In 1954 the United Free Church of Scotland, made up of those congregations from the then United Free Church which in 1929 dissociated themselves from union with the Church of Scotland, was composed of nine presbyteries. Its congregations in 1954 numbered 121, its ministers 83, and its communicant members 24,742. It is served by a number of missionaries in the foreign field. For the training of its ministers it maintains its own theological college conjointly with the Congregational Union of Scotland. Its general assembly meets annually in June at Edinburgh and Glasgow alternately.

(*See* also SCOTLAND, CHURCH OF.)

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND, the title of the former political unity composed of

England, Wales, Scotland and Ireland, officially adopted on Jan. 1, 1801, when the Act of Union between Great Britain and Ireland came into force. The name Great Britain has been used since the union of the kingdoms of England and Scotland in 1707 as the official designation of the united countries.

When, in 1922, 26 Irish counties were severed from the United Kingdom and erected into a dominion of the British empire under the name of the Irish Free State (later Eire, Ireland), no provision was made in the act for any change in the royal style or in the title of the imperial parliament. From 1922 onward, however, the title of United Kingdom of Great Britain and Northern Ireland was frequently used in official documents to designate those parts of the British Isles represented in the imperial parliament, meeting at Westminster. In the report of the interimperial relations committee of the imperial conference of 1926 it was suggested that, in view of new constitutional developments, the words "United Kingdom" should be omitted from the royal style, which should run: "George V, by the Grace of God, of Great Britain, Ireland, and the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India."

By the Royal and Parliamentary Titles act, 1927 (17 Geo. 5, ch. 4), accordingly, the king was authorized to change the style and titles of the crown by royal proclamation. This was done, on May 13, 1927, by a proclamation adopting the recommendation of "the representatives of our Governments in Conference," and declaring that in the English style "Great Britain, Ireland and . . ." should henceforth be used instead of "the United Kingdom of Great Britain and Ireland." By the same act of parliament (2, 1) it was enacted that "Parliament shall hereafter be known as and styled the parliament of the United Kingdom of Great Britain and Northern Ireland." The accession of Queen Elizabeth II in 1952 provided an opportunity to bring the royal title into harmony with the parliamentary. On May 29, 1953, under the Royal Titles act, a proclamation was issued by which the queen adopted the title of "Elizabeth II, by the Grace of God, of the United Kingdom of Great Britain and Northern Ireland. . . ."

(*See* also ENGLAND; GREAT BRITAIN; IRELAND; IRELAND, NORTHERN; IRELAND, REPUBLIC OF; SCOTLAND; WALES.)

UNITED METHODIST CHURCH, or UNITED METHODISTS, an English Nonconformist community formed in 1907 by the union of the Methodist New Connection (1797), the Bible Christians (1815) and the United Methodist Free Churches (1857). The act of parliament which enabled this amalgamation received the royal assent on July 26, 1907. The union was completed on Sept. 16, 1907, in Wesley's chapel, City road, London. (For recent statistics *see* METHODISM.)

UNITED METHODIST FREE CHURCHES, an English Nonconformist community merged since 1907 in the United Methodist Church (*q.v.*).

UNITED NATIONS. On Jan. 1, 1942, 26 nations signed the declaration by the United Nations which affirmed their union against the axis powers. At Moscow in Oct. 1943 the United Kingdom, the Union of Soviet Socialist Republics and the United States, joined by the Republic of China, agreed to establish a general international organization for the maintenance of international peace and security "at the earliest practicable date." In the late summer and fall of 1944, representatives of these four powers met at Dumbarton Oaks (Washington, D.C.) to draw up a series of proposals for the new organization. These proposals were circulated among all states at war with the axis powers for comment and suggested amendment. An agreement on the voting procedure in the Security council was reached by Franklin D. Roosevelt, Winston Churchill and Joseph Stalin at the Yalta conference in Feb. 1945. Forty-six states sent delegates to the conference which convened at San Francisco, Calif., on April 25, 1945, to draw up the charter of the United Nations. After the conference opened, four more states were admitted. The charter was signed on June 26 by representatives of 50 states; Poland signed on Oct. 15. It entered into force on Oct. 24, 1945, when China, France, the U.S.S.R., the United Kingdom and the United States and a majority of other signatories had deposited their ratifications.

Purposes and Membership.—The first article of the charter outlines the purposes of the organization. The primary objective is the maintenance of international peace and security. The organization also dedicated itself to the development of friendly relations among nations, based on the principle of equal rights and self-determination of peoples; to the achievement of international co-operation in solving international problems of an economic, social, cultural or humanitarian character; and to serving as a centre for harmonizing the actions of nations in the attainment of these common ends. Some of the basic principles of the United Nations, as outlined in article 2 of the charter, are as follows: the United Nations is based on the sovereign equality of its members; disputes are to be settled by peaceful means; members undertake not to use force or the threat of force in contravention of the purposes of the United Nations; each member must assist the organization in any action it takes under the charter; and states not members of the United Nations are required to act in accordance with these principles so far as may be necessary for the maintenance of international peace and security. Article 2 also stipulates that the organization shall not intervene in matters which are essentially within the domestic jurisdiction of any state, except to take enforcement measures.

The original members of the United Nations were as follows: Argentina, Australia, Belgium, Bolivia, Brazil, Byelorussian S.S.R., Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, India, Iran, Iraq, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Panamá, Paraguay, Peru, Philippines, Poland, Saudi Arabia, Syria, Turkey, Ukrainian S.S.R., Union of South Africa, Union of Soviet Socialist Republics, United Kingdom, United States, Uruguay, Venezuela and Yugoslavia.

New members are admitted to the United Nations on recommendation of the Security council by a two-thirds vote of the general assembly. They must be "peace-loving states," accept the obligations contained in the charter and be able and willing to carry out these obligations. The requirement of concurrence of the permanent members of the Security council has been a serious obstacle to the admission of new members. Up to the mid-1950s only 9 of 31 applicants had been admitted. These were Afghanistan (1946), Iceland (1946), Sweden (1946), Thailand (1946), Pakistan (1947), Yemen (1947), Burma (1948), Israel (1949) and Indonesia (1950). A number of efforts had been made by the general assembly to break the deadlock. The major powers were asked to forgo the use of the veto and to try to reach agreement among themselves, and the International Court of Justice was asked to give opinions on legal questions. In the tenth assembly (1955) there was wide support for a "package deal" sponsored by 29 members, under the leadership of Canada. Though it became necessary to drop Japan and Outer Mongolia from the package, in modified form the proposal was approved by the Security council, and the general assembly voted to admit 16 new members: Albania, Jordan, Ireland, Portugal, Hungary, Italy, Austria, Rumania, Bulgaria, Finland, Ceylon, Nepal, Libya, Cambodia, Laos and Spain. In its 11th session (1956–57) the general assembly voted, to admit Tunisia, Morocco, Sudan, Japan and Ghana. The new Federation of Malaya was admitted at the beginning of the 12th session (Sept. 1957), bringing the total number of members up to 82.

PRINCIPAL ORGANS

The United Nations has six principal organs: the general assembly, the Security council, the Economic and Social council, the Trusteeship council, the International Court of Justice and the secretariat.

General Assembly.—This is the only body on which all members are represented. Although a member may send five representatives to the general assembly, each member has only one vote. Decisions on substantive questions are taken by a majority or two-thirds vote, depending on the importance of the matters involved. Procedural questions are decided by a majority vote.

Through its deliberative, supervisory, financial and elective functions, the general assembly occupies a key position in the

functioning of the United Nations. Its role as a deliberative organ finds its basis in articles 10 to 14 of the charter. Article 10, the most inclusive in its provisions, states that the general assembly may discuss and make recommendations on "any questions or any matters within the scope of the Charter or relating to the powers and functions of any organs provided for in the present Charter." The general assembly is expressly authorized to deal with specific disputes and situations brought before it and to undertake studies and make recommendations for promoting international co-operation in political, social, economic, cultural and educational matters, for encouraging the development of international law and for assisting in the realization of human rights and fundamental freedoms.

In performing its supervisory functions, the general assembly exercises general control over the activities of United Nations organs in the economic and social fields and in dealing with the problems of nonself-governing territories. The general assembly receives annual reports from the secretary-general and the Security, Economic and Social and Trusteeship councils, and may make recommendations to these organs. The Economic and Social council and the Trusteeship council operate under the authority of the general assembly. The assembly approves trust agreements and through the Trusteeship council supervises the administration of trust territories. It exercises general supervision and control over the operations of the secretariat. The financial power of the assembly is exercised through its control over the budget of the United Nations and the scale of assessments levied on members. In its elective capacity, the general assembly chooses all members of the Economic and Social council and the elective members of the Security and Trusteeship councils. Along with the Security council, it also participates in the election of judges of the International Court of Justice and the appointment of the secretary-general. The assembly shares with the council the power to initiate amendments to the charter as well as the right to convene a conference for the purpose of revising the charter.

During its first ten years, the general assembly progressively increased in importance as an organ of deliberation and influence in the political field. The decline in the influence and effectiveness of the Security council because of the inability of the permanent members to co-operate encouraged the greater use of the general assembly. The broad language of the charter permitted a substantial increase in the role of the general assembly beyond what was originally envisaged and most members of the organization had an interest in encouraging this increase. Members consequently became more and more concerned with ways and means of equipping the assembly, in organization and procedure, for the more effective performance of its growing responsibilities.

The assembly convenes annually; its rules permit special sessions on short notice. In performing its tasks, it works through a fairly complex structure of main committees, procedural committees, standing committees and subsidiary and *ad hoc* bodies. The main committees to which agenda items are referred as a rule for consideration before final assembly action consist of the First committee (political and security), Special Political committee, Second committee (economic and financial), Third committee (social, humanitarian and cultural), Fourth committee (trusteeship and nonself-governing territories), Fifth committee (administrative and budgetary) and Sixth committee (legal). The Special Political committee, replacing the temporary *ad hoc* political committee, has been established to share with the First committee the heavy load of political items.

Security Council.—The charter places on the Security council the primary responsibility for maintenance of international peace and security. Eleven members of the United Nations are members of the council, the five permanent members (China, France, the United Kingdom, the U.S.S.R. and the United States) and six nonpermanent members, which are elected by the assembly and serve two-year terms. In selecting nonpermanent members, the assembly must strive for an equitable geographical distribution as well as consider their contribution to the maintenance of international peace and security. From the beginning, nonpermanent members of the Security council were elected with a view to giving representation to certain regions or groups of states. Thus, as a rule, one member was elected from western Europe, one from eastern Europe, one from the Arab league, one from the British Commonwealth and two from Latin America. The right of members from the area or group to nominate the member to be elected was successfully challenged in 1949 when the assembly elected Yugoslavia in the face of strong opposition from the Soviet bloc. In the tenth session the pattern of representation was modified when, in order to break a deadlock, Yugoslavia, though elected, agreed to resign at the end of a year, its place to be taken by the Philippines. In the 11th session a proposal was made to increase the number of nonpermanent members to eight, but this was opposed by the Soviet Union.

Under the charter, all members of the United Nations agreed to carry out the decisions of the Security council. This agreement was interpreted to refer primarily to decisions under chapter vii of the charter. The council is authorized to investigate any dispute which might threaten international peace and security, and to make recommendations for its peaceful settlement. The council may also call on members of the United Nations to apply economic and diplomatic sanctions against any state which the council has found guilty of breach of the peace or act of aggression. It may also decide what military measures are to be taken by members, but this power did not become operative because of the failure to conclude agreements specifying the armed forces and facilities to be placed at the disposal of the Security council by members. The council may also make recommendations on the regulation of national armaments.

On procedural matters, decisions by the council are made by an affirmative vote of any seven of its members; on substantive matters, which include the investigation of any dispute and the application of sanctions, seven affirmative votes including the concurrence of the five permanent members are required. A vote as to whether a matter is procedural or substantive is itself a substantive question.

The council is required to be so organized as to be able to function continuously. Each member is represented at all times at the seat of the organization. The presidency of the council rotates monthly. Like the general assembly, the council has established a number of subsidiary organs to assist it. The Military Staff committee is responsible for the strategic direction and deployment of any armed forces placed at the disposal of the council.

Economic and Social Council.—The Economic and Social council is charged with directing and co-ordinating the complex system of economic, social, humanitarian and cultural activities of the United Nations. It comprises 18 members, elected by the assembly for three-year terms with the possibility of re-election. Although the council, unlike the Security council, has no permanent members, states whose participation is considered necessary to the work of the council have been regularly re-elected. The assembly endeavours to keep the membership of the council representative of the world's economic, cultural and religious systems.

The Economic and Social council meets at least twice a year; it is directed by the charter to make or initiate studies and make recommendations with respect to the promotion of international co-operation in economic and social matters. It may prepare draft conventions for submission to the assembly and call international conferences for specific purposes.

The council is assisted in its work by functional and geographical commissions. The functional commissions carry out studies in the economic and social field and otherwise assist the council in the performance of its duties. They formulate resolutions, recommendations and international conventions on which the council and general assembly take action. The functional commissions initially established consisted of the following: Economic and Employment commission (with two subcommissions), Transport and Communications commission, Fiscal commission, Statistical commission (with one subcommission), Population commission, Social commission, Commission on Human Rights (with two subcommissions on Freedom of Information and of the Press and Prevention of Discrimination and Protection of Minorities), Commission on the Status of Women and Commission on Nar-

cotic Drugs. Subsequently the Economic and Employment commission and its subcommissions, the Fiscal commission and the Subcommission on Freedom of Information and of the Press were discontinued. In 1954 a commission on International Commodity Trade was established. Three regional commissions—on Europe, Asia and the far east, and Latin America—which were established to deal with specific regional economic problems assumed roles of considerable importance both as advisory organs and as organs with important operational responsibilities.

Trusteeship Council.—Acting under the authority of the general assembly, the Trusteeship council supervises the administration of trust territories by the states which are administering authorities. The composition of the council ensures that membership is equally divided between members which administer trust territories and those which do not. Furthermore, the permanent members of the Security council are assured membership. The seven members of the council who are administering authorities are: Australia, Belgium, France, Italy, New Zealand, the United Kingdom and the United States. China and the Soviet Union are members by virtue of permanent membership on the Security council. The remaining five nonadministering members are elected by the assembly for three-year terms. The Trusteeship council is authorized to send visiting missions of inspection into the trust territories to receive and examine petitions, to consider reports submitted to it annually by the administering authorities and to make recommendations with respect to all matters coming within its purview. The council is required to submit annual reports on its activities to the general assembly.

International Court of Justice.—The court is the principal judicial organ of the United Nations. Its statute is an integral part of the charter of the United Nations. The 15 judges of the court are elected by the general assembly and the Security council voting independently. No two judges may be nationals of the same state. Representation of the main forms of civilization and of the major legal systems of the world is to be assured. Judges serve for nine years and are eligible for re-election.

The jurisdiction of the court comprises all cases which parties submit to it, and all matters specially provided for in the charter or in other treaties. States, by formal declaration, may accept the compulsory jurisdiction of the court in specified categories of disputes. The court may give advisory opinions at the request of the general assembly or the Security council, or at the request of other organs and specialized agencies authorized by the general assembly. (*See* INTERNATIONAL COURT OF JUSTICE.)

The Secretariat.—The secretariat is headed by the secretary-general and consists of such staff as the organization may require. The secretary-general is appointed by the general assembly upon the recommendation of the Security council. At the beginning of its first session in 1946, the general assembly chose Trygve Lie (Norway) for a term of five years, which in 1951 was extended for three years. This extension was bitterly opposed by the U.S.S.R., and in Nov. 1952 Lie resigned. In April 1953 Dag Hammarskjöld (Sweden) was appointed his successor. The secretary-general is the chief administrative officer of the United Nations. He also has important political functions, being specially charged with bringing before the organization any matter that threatens or violates international peace and security. He and his staff perform secretarial functions for the various organs. He submits an annual report to the general assembly on the work of the organization during the preceding year.

Until 1954 the secretariat comprised the executive office of the secretary-general, eight departments (each under an assistant secretary-general) and the Technical Assistance administration. On assuming the duties of secretary-general, Hammarskjöld initiated a review of the organization and work of the secretariat and, after receiving general assembly approval of his ideas, carried out an extensive reorganization effective from Jan. 1, 1955. In general, the objectives of the reorganization were to achieve stronger policy direction, a more logical grouping of functions and responsibilities and greater efficiency and economy. Under the reorganization, the number of departments was reduced to five—Political and Security Council Affairs, Economic and Social Affairs, Trusteeship and Information from Non-Self-Governing Territories, Public Information and Conference Services. This reduction was achieved by combining existing departments or by transferring functions to the executive office or other departments. In place of 8 assistant secretaries-general and 11 principal directors, provision was made for 7 undersecretaries (2 without portfolio and with special political responsibilities), 5 heads of offices and 2 deputy undersecretaries. The Technical Assistance administration was set up as an independent agency under a director-general.

DISPUTES AND SITUATIONS AFFECTING INTERNATIONAL PEACE AND SECURITY

By the terms of the charter, the members of the United Nations conferred upon the Security council primary responsibility for the maintenance of international peace and security. At the San Francisco conference the basic assumption underlying the United Nations as an international security organization was that there would be co-operation among the five permanent members of the Security council on important questions. In fact, it was made a charter requirement that substantive decisions of the council could be taken only with the concurrence of the permanent members. It was realized that should the Big Five fail to agree, the council would be unable to perform its functions. The growing rift between the Soviet Union and the western powers after 1945 resulted in frequent use of the veto, which seriously reduced the effectiveness of the Security council in the discharge of its primary responsibility. As a result, there was an increasing tendency on the part of members to seek security through collective self-defense arrangements, such as NATO, concluded under article 51 of the charter and, so far as United Nations action was concerned, to look to the general assembly to assume responsibilities in this field.

In 1946 the assembly was asked to deal with the Spanish question, originally brought before the Security council. The U.S.S.R. had vetoed a proposal dealing with Spain on the ground that it should have been more strongly worded, and the question was subsequently brought before the assembly which finally adopted a resolution on Dec. 12, 1946. In the summer of 1947 a Soviet veto prevented the adoption by the Security council of a resolution approving the findings of a commission which had been set up to investigate the disorders on the northern borders of Greece. The question was removed from the council's agenda, and the United States brought the question before the assembly.

In the Korean case, the absence of the U.S.S.R. from the council enabled the council in June 1950 to take prompt action against the North Korean forces attacking the Republic of Korea. Realizing that this condition was not likely to be repeated in the future, the general assembly in Nov. 1950, on United States initiative, adopted the Uniting for Peace resolution by which the assembly assumed additional responsibilities for the maintenance of international peace and security. This resolution provided that the assembly should take action with reference to a threat or breach of the peace or act of aggression should the Security council fail to exercise its primary responsibility in that field. The assembly may be convened for the purpose by the secretary-general, if requested by the Security council or by a majority of the members of the United Nations, in an emergency session within 24 hours. The resolution requested United Nations members to set aside contingents in their national armed forces to be made available to the United Nations should the assembly recommend the use of armed force under this resolution.

The resolution also established the Peace Observation commission to observe and report on areas of the world where existing tension might impair international peace and security. The commission was directed to be at the disposal of the Security council or the assembly if the council was not exercising its functions. It also established the Collective Measures committee to study and report on methods which the assembly might use in strengthening international peace and security.

Iran.—The first situation to be brought before the United Nations was Iran's complaint to the Security council of Jan. 19, 1946, that the Soviet Union was interfering with Iran's internal affairs by not withdrawing its troops from northern Iran. The

council called on both parties to negotiate their differences. However, on March 18 Iran reported that the Soviet Union had not withdrawn its troops. On April 4, 1946, the council requested both parties to report to it by May 6 on progress made in the withdrawal of the Soviet forces. Two days later, the U.S.S.R. requested the council to remove the matter from its agenda since Iran had sought to withdraw the original complaint, but the council rejected the Soviet proposal. The Soviet representative withdrew in protest. On May 6 Iran reported the withdrawal of Soviet troops from all provinces except Azerbaijan where facts were not known.

Greece.—The Greek question proved to be a more difficult issue for the United Nations to handle, requiring the attention of the general assembly as well as the Security council. In Dec. 1946 Greece charged that Albania, Bulgaria and Yugoslavia were aiding Communist guerrillas in northern Greece, and asked the council to investigate this situation. The council established the Commission of Investigation, which, after an on-the-spot examination of the alleged disorders, supported the Greek accusations by a majority vote. The council, unable to agree on a resolution, removed the question from its agenda on Sept. 15, 1947. The matter was brought before the general assembly by the United States. In its resolution of Oct. 21, 1947, the assembly requested all parties concerned to negotiate their differences, and established the United Nations Special Committee on the Balkans (UNSCOB) to facilitate peaceful settlement of the dispute. The Soviet Union and the satellite states refused to co-operate. In its first report to the assembly in 1948 the committee reported the continuation of aggressive interventionist activity by Greece's northern neighbours. The general assembly in Nov. 1948 called on Albania, Bulgaria and Yugoslavia to terminate their support of the communist guerrillas in Greece. It authorized the committee to continue its mediatory efforts. The situation had markedly improved by the end of 1948, largely because of United States aid to Greece and Yugoslavia's break with Moscow. The sixth session of the assembly terminated the Special Committee on the Balkans, and the task of observing and reporting conditions along Greece's northern frontier was delegated to the Peace Observation commission.

Indonesia.—In July 1947 Australia and India called the Security council's attention to hostilities which had broken out between the Republic of Indonesia and the Netherlands. Although the Netherlands argued that the United Nations could not act because the matter was within the Netherlands' "domestic jurisdiction," the council called on the parties to cease hostilities and settle the dispute peacefully. It then appointed the Committee of Good Offices to facilitate a peaceful settlement. In Jan. 1948 both parties signed the "Renville" agreement, providing for a truce and setting forth the political principles to govern a final settlement. The Netherlands renounced the agreement in Dec. 1948 and resumed hostilities. In Jan. 1949 the Security council again called on both sides to terminate armed action, recommended the establishment of a federal, independent and sovereign United States of Indonesia at the earliest possible date and charged the United Nations Commission for Indonesia (which replaced the Committee of Good Offices) to assist the parties in implementing this resolution. With the assistance of the commission, the parties involved finally reached agreement on the transfer of sovereignty from the Netherlands to the Republic of Indonesia at a round-table conference which met at The Hague from Aug. 23 to Nov. 2, 1949. The formal transfer of sovereignty took place on Dec. 27, 1949.

Palestine.—After World War II, because of the increased agitation on the part of the Jews for a national home and place of refuge and the deterioration of relations between the Jews and Arabs, Great Britain requested that the matter be considered by the general assembly. A special session, meeting from April 28 to May 15, 1947, established the United Nations Special Committee on Palestine (UNSCOP) to investigate possible solutions of this problem. After inspecting conditions in Palestine, the special committee submitted majority and minority reports to the general assembly in Nov. 1947. The majority report, violently opposed by the Arab states, proposed the partition of Palestine into an Arab and a Jewish state and the establishment of an international regime for Jerusalem, the three areas to be joined by an economic union. The minority plan called for an independent federal state. The general assembly accepted the majority plan and called on the Security council to take enforcement action should any interested party attempt to use force to alter the proposed partition. Great Britain announced its intention to terminate the mandate on May 15, 1948.

There was an increase in fighting between Arabs and Jews following the adoption of the assembly's resolution. The assembly, meeting in special session in April and May 1948, decided to invite the permanent members of the Security council to appoint a United Nations mediator. Count Folke Bernadotte of Sweden was subsequently appointed. He was directed to use his good offices to promote cessation of hostilities and a peaceful settlement of the dispute and also to assist the Security council's Truce commission which had been established previously.

On May 15, 1948, Britain terminated its mandate over Palestine, and the new state of Israel was proclaimed. The Arab states immediately had recourse to armed force. In a series of resolutions, progressively more insistent, the Security council called on the parties to cease hostilities. On July 15 the council passed its strongest resolution, warning the parties that, unless they desisted from military action, enforcement measures by the United Nations would be undertaken. Through the efforts of Count Bernadotte, agreements for a truce were finally reached on July 16 and 18. Following the assassination of Count Bernadotte by Jewish terrorists in Sept. 1948, Ralph Bunche of the United States was appointed acting mediator. During 1949 he was successful in negotiating armistice agreements between Israel and the Arab states.

In the autumn of 1948 the general assembly established the United Nations Conciliation commission to assist Israel and the Arab states to reach agreement on boundaries, repatriation of refugees and a general political settlement. This action, followed in Aug. 1949 by a Security council resolution relieving the acting mediator of further responsibilities under council resolutions, meant that responsibility for achieving a political settlement was placed on the commission, while the truce organization under the armistice agreements, headed by the chief of staff, and the Security council had responsibility for maintaining peace.

Failure to find an acceptable solution of the Arab refugee problem and the intransigent positions of both Jews and Arabs blocked all efforts of the Conciliation commission to achieve a political settlement. Complaints of armistice violations were numerous and became increasingly serious in 1954 and 1955. The announcement in Sept. 1955 of a Soviet-Egyptian trade agreement for the exchange of cotton for arms was followed by increased tension. Relations between Egypt and Israel were particularly acute and, following border clashes, the Security council in September called upon the two governments to withdraw their armed forces along the demarcation line to avoid further incidents. On April 14, 1956, the council directed the secretary-general to go to the area to assist in preserving peace.

After discussions with the governments concerned, the secretary-general reported to the Security council on May 10 that he had found a "general will to peace" and that unconditional cease-fire agreements had been established between Israel and its Arab neighbours. He stressed that further initiative rested with the governments concerned. However, during the summer and early autumn, relations between Egypt and Israel rapidly deteriorated. Finally, on Oct. 29, Israeli armed forces invaded the Sinai peninsula and quickly overran the peninsula and the Gaza strip. Israel cited in justification Egypt's blockade of Israeli shipping through the Suez canal, Egyptian president Gamal Abdel Nasser's threats and military plans and "fedayeen" raids. On Oct. 30 the British and French governments demanded that Egypt and Israel agree to a cease fire within 12 hours, withdraw their armed forces from the vicinity of the Suez canal and agree to temporary British-French occupation of key points in the canal zone. Egypt refused, and the British and French began military action against Egypt.

On Oct. 29 the U.S. asked that the Security council consider the Israeli attack. On the 30th France and the United Kingdom vetoed a United States draft resolution calling for an immediate

cease fire and the withdrawal of Israeli forces. The next day the Security council called a special session of the general assembly under the Uniting for Peace resolution to consider the Israeli, French and United Kingdom military actions. On Nov. 2 the assembly adopted a resolution calling for a cease fire, the withdrawal of troops and no introduction of military goods in the area. On Nov. 5 the assembly established a United Nations command for an emergency international force (UNEF), "to secure and supervise the cessation of hostilities," under Gen. E. L. M. Burns, chief of staff of the UN Truce Supervision organization. Israel, Egypt, France and the United Kingdom then agreed to a cease fire unconditionally and Egypt accepted UNEF. On Nov. 7 the assembly approved the recommendations contained in the secretary-general's report on the duties, organization and functioning of this force, to be composed of contingents from the smaller countries. The first contingents of UNEF arrived in Egypt on Nov. 15. British and French forces finally completed withdrawal on Dec. 22. By the middle of Jan. 1957 Israeli forces had been withdrawn from all occupied territory except the Sharm el Sheikh area and the Gaza strip. The UNEF withdrew from the Suez canal zone following withdrawal of French and U.K. forces and was being used to facilitate the withdrawal of Israeli forces. Israel conditioned complete withdrawal on guarantees of future Israeli security.

Suez Canal Question.—The Egyptian government first brought the question before the Security council in 1947 when a revision of the 1936 treaty with the United Kingdom was being sought. In 1954 an agreement was concluded between Egypt and the United Kingdom providing for the withdrawal of U.K. forces from the canal zone. After Colonel Nasser nationalized the canal company in July 1956, the United Kingdom and France first sought to get Nasser's agreement to a plan for the effective internationalization of the canal. Failing this, they brought the question to the Security council which, on Oct. 13, adopted a resolution setting forth six principles on which a settlement should be based. Failure of subsequent efforts to implement these principles was thought to be one reason for the British-French military action against Egypt on Oct. 30. Following the blocking of the canal by Egypt in opposing British-French military action, the UN, by agreement with Egypt, undertook the task of clearance.

Hungary.—Popular discontent in Hungary led in Oct.–Nov. 1956 to the use of Soviet forces to prevent an anti-Communist regime from being established. On Oct. 27 the United States, the United Kingdom and France asked that the Security council consider the situation. The Soviet Union vetoed a U.S. proposal calling on the U.S.S.R. to cease and desist. The council requested an emergency session of the general assembly, but resolutions of that body calling on the Soviet Union to desist from military intervention and to respect the right of the Hungarian people to independence, affirming the desirability of free elections and requesting the secretary-general to carry out an investigation of conditions in Hungary were disregarded by the Soviet and Hungarian governments on the grounds that this was a domestic matter.

India-Pakistan Question.—The state of Jammu and Kashmir, located in the northern part of the Indian subcontinent between India and Pakistan, was given its choice, under the British Indian Independence act of 1947, to accede to either of its neighbours. Both India and Pakistan pressed their claims. In the autumn of 1947 Moslem tribal groups invaded Kashmir, and Indian forces were sent in at the request of the Kashmir government after it had elected to accede to India. India brought the situation before the Security council on Jan. 1, 1948, and demanded that the council order Pakistan to desist from encouraging and supporting hostilities in Kashmir. Pakistan, however, denied India's accusation and requested the council to appoint a commission to assist in ending hostilities in Kashmir and to facilitate the withdrawal of Indian and Pakistan troops so that a plebiscite could be held. On Jan. 20, 1948, the Commission on India and Pakistan was established by the council and was directed to place its good offices and mediatory services at the disposal of the two states.

A cease-fire agreement became effective on Jan. 1, 1949, and United Nations observers helped in its enforcement. The commission was unsuccessful, however, in its efforts to achieve a political settlement. In April 1950 Sir Owen Dixon of Australia was appointed by the Security council as United Nations representative to serve as mediator between the parties.

In April 1951 Frank Graham of the U.S. replaced Dixon. The commission and the representatives were able to narrow the area of disagreement but could not get full agreement on the two main issues: the demilitarization of Kashmir and the conduct of a free and impartial plebiscite.

Korea.—Shortly after the end of World War II the northern half of the peninsula of Korea was occupied by the U.S.S.R. while the area south of the 38th parallel was occupied by United States forces. When the Soviet Union and the U.S. reached an impasse in their negotiations to achieve a united democratic Korea, the U.S. requested the general assembly in Sept. 1947 to consider the question. The assembly passed a U.S.-sponsored resolution calling for elections in Korea under UN supervision preparatory to constituting a national government for that country. On May 10, 1948, elections were held in South Korea alone after the Soviet military authorities had refused UN supervision in North Korea, and a government of the Republic of Korea was established in the south. The general assembly in Dec. 1948 declared that this was the only government in Korea based on free elections. Meanwhile, Soviet authorities assisted in the establishment of a government in North Korea, known as the People's Republic of Korea. During 1948–49 both the U.S. and Soviet troops were withdrawn from Korea.

On June 25, 1950, the armed forces of North Korea invaded South Korea. On the same day the Security council called on North Korean authorities to withdraw their armed forces and demanded an immediate cessation of hostilities. When the North Korean authorities disregarded this resolution, the council on June 27 called on members of the United Nations to "furnish such assistance to the Republic of Korea as may be necessary to repel the armed attack and to restore international peace and security in the area." Led by the United States, many UN members gave material assistance to the Republic of Korea. On July 7 the council requested the U.S. to appoint a supreme commander for United Nations forces in Korea, and Gen. Douglas MacArthur was so designated. Following the Inchon landing in mid-Sept. 1950, the United Nations forces sought to drive the Communists from all of Korea, the general assembly in Oct. 1950 having implicitly approved this course. The assembly established the United Nations Commission for the Unification and Rehabilitation of Korea to carry out the original unification goal of the United Nations. In late Oct. 1950 contingents from the Communist Chinese army actively intervened.

After failing to achieve a cease fire and the peaceful settlement of the dispute, the assembly, on Feb. 1, 1951, labeled Communist China an aggressor and established an Additional Measures committee to consider the application of sanctions against that government. On May 18 the assembly recommended that members apply an embargo on arms, munitions and other implements of war against areas controlled by the Communists. Many states had already applied such measures.

After two years of negotiations a truce agreement was signed on July 27, 1953, which contained guarantees against future aggression and which provided for a line of demarcation in the vicinity of the 38th parallel that was more defensible than the original line. It recommended that within three months a political conference be held to arrive at a peaceful settlement of the Korean question. A conference for this purpose met at Geneva, Switz., in 1954, but ended in failure. While the Korean question was considered by the assembly at every subsequent session, the deadlock remained unbroken. (*See* also KOREAN WAR.)

Corfu Channel.—In Jan. 1947 Britain called the Security council's attention to a dispute with Albania concerning damage incurred by British warships and naval personnel as a result of the detonation of mines in the Corfu channel. The U.S.S.R. vetoed a resolution which placed the blame on Albania, and the council recommended that Britain and Albania submit the dispute to the International Court of Justice. The parties agreed to submit the

dispute to the court, but Albania refused to carry out the court's judgment as to the amount of compensation.

Berlin.—In Sept. 1948 the Security council considered the question of the Soviet blockade of west Berlin which severed contact between the western powers and their zones in the German capital. The U.S.S.R. argued that the council had no authority to deal with this matter, and when the council, in Oct. 1948, voted to place the question on its agenda, the Soviet Union refused to participate in the council's discussions of the blockade. Although the council was unable to work out an acceptable solution to the question after several attempts, the United States and Soviet representatives on the council reached an understanding which permitted a settlement to be subsequently reached.

Italian Colonies.—After the Council of Foreign Ministers was unable to agree on the disposal of the former Italian colonies of Libya, Somaliland and Eritrea following World War II, a clause was inserted in the Italian peace treaty of 1947 to the effect that, in the event of continued disagreement, the matter would be referred to the general assembly for a final determination. When agreement was again found impossible, the matter was placed before the assembly in April 1949. In Nov. 1949 the assembly decided that by Jan. 1, 1952, Libya should become an independent state and that until then it should be administered by a United Nations commissioner, advised by a council of representatives consisting of six United Nations members and four local inhabitants. Under the guidance of Adrian Pelt, United Nations administrator, Libya was prepared for statehood, and on Dec. 24, 1951, became the first formerly dependent area to become an independent state under the aegis of the United Nations. Somaliland was placed under UN trusteeship, with Italy serving as the administering authority. The assembly declared that this former colony should receive its independence ten years after the assembly approved of the trusteeship agreement, which it did in Dec. 1950. The assembly decided in 1950 that Eritrea should be federated with Ethiopia, although it should retain as much local autonomy as possible. The United Kingdom was selected as the administering authority to prepare for federation, which took place Sept. 15, 1952.

Anglo-Iranian Oil Dispute.—Following Iranian nationalization of the properties of the Anglo-Iranian Oil company in May 1951 the United Kingdom asked the International Court of Justice to adjudicate. The court called upon Iran to take certain provisional measures and when Iran refused, the United Kingdom, on Oct. 1, asked the Security council to take action. The council deferred action until after the court had determined its jurisdiction. In July 1952 the court decided that it did not have jurisdiction and the dispute was subsequently settled by negotiation between the interested parties.

Tunisia, Morocco and Algeria.—In 1951, at its sixth session, and at succeeding sessions, the general assembly was asked by Asian and African members to consider the situation in Morocco resulting from the alleged denial by France of Moroccan national aspirations. In 1952 the assembly adopted a moderate resolution expressing the hope that the parties through continuing negotiations would reach agreement on the development of free political institutions in accordance with the principles of the charter. The question of Tunisia was brought first before the Security council and then the general assembly by the same Asian and African members. Assembly action was similar to that in the case of Morocco. When in 1955 the question of Algeria was brought before the assembly, the French delegation entered a more vigorous protest against United Nations jurisdiction than in the other cases, arguing that the question was clearly domestic since Algeria was a part of metropolitan France. When the assembly placed the question on its agenda, the French delegation left the general assembly and returned only when the assembly decided at a later date to remove it. France accepted the decision of the 11th session to include the question in its agenda.

Other Questions.—A number of other disputes and situations were brought to the attention of the United Nations during its first ten years, for the most part without any positive results being achieved. Early efforts by the general assembly to eliminate the Franco regime in Spain as a menace to the peace proved to be fruitless and were terminated in 1950. From the beginning the general assembly considered the question of racial discrimination in South Africa, first in its application to persons of Indian origin and then in its application to the native African population. The government of South Africa denied the competence of the assembly even to discuss these matters and disregarded assembly recommendations. In 1948 the Security council was asked to consider Soviet intervention in Czechoslovakia but action was prevented by Soviet use of the veto. In 1949 the assembly was asked to consider alleged violations of human rights in Bulgaria, Hungary and Rumania but, even when backed by an opinion of the International Court, the assembly resolution of condemnation was disregarded. Efforts by the Greek government in 1954 and 1955 to get general assembly consideration of its claim that the inhabitants of Cyprus were being denied the right of self-determination failed, the United Kingdom invoking the domestic jurisdiction principle.

GENERAL QUESTIONS RELATING TO PEACE AND SECURITY

Regulation of Armaments.—The charter places responsibility on the Security council for preparing and submitting plans for the regulation of national armaments. The general assembly may discuss and recommend principles governing "disarmament and the regulation of armaments." "Regulation" implies the availability of armaments for United Nations purposes as well as limitation and reduction. The development of the atomic bomb during World War II and its use in Aug. 1945 created a situation in which it seemed to the United States and other governments that the international control of atomic energy demanded consideration even in advance of any perfection of collective security arrangements. Consequently, the first action of the United Nations was the establishment of the Atomic Energy commission by the general assembly in Jan. 1946 to prepare plans for the control of atomic energy. In Dec. 1946 the general assembly adopted a resolution providing for the urgent consideration of the control of atomic weapons and other weapons of mass destruction, and at the same time the consideration of practical measures for the regulation and reduction of all armaments and armed forces.

The Atomic Energy commission began its deliberations in June 1946. It soon became apparent that there was complete disagreement between the United States and the U.S.S.R. The commission submitted reports to the Security council in 1946, 1947 and 1948. The majority of the commission called for international managerial control or ownership of atomic energy activities, international inspection by a proposed international atomic development authority and the elimination of the veto from enforcement provisions of the agreement. The majority also insisted that the control system should be in operation before the existing stockpile of atomic bombs was destroyed. The Soviet Union, however, took an opposite view. It refused to agree to international ownership and to the kind of international inspection demanded by the majority; it demanded that the veto be applicable to enforcement measures under the plan and that the destruction of atomic stockpiles should accompany the establishment of a system of control. The commission recorded an impasse in negotiations in its 1948 report, though some agreement had been reached on matters of detail.

To deal with armaments other than weapons of mass destruction, the Security council organized the Commission for Conventional Armaments. Progress in this field was likewise blocked by disagreement between the U.S.S.R. and the western powers. Although the commission and the general assembly in 1949 approved a plan whereby each state would submit full information to the commission on its conventional armaments and armed forces, the refusal of the U.S.S.R. to accept the plan prevented any implementation. By early 1950 it was clear that a hopeless deadlock had been reached.

At its fifth session in 1950 the general assembly considered a United States proposal to combine the work of the Atomic Energy and the Conventional Armaments commissions. In Jan. 1952 the assembly voted to merge the two commissions into a Disarmament commission, thus recognizing the interdependence of the various

elements of the problem. The Disarmament commission, which consisted of the members of the Security council and Canada, was directed to prepare proposals for the regulation, limitation and balanced reduction of all armed forces and armaments, for the elimination of major weapons adaptable to mass destruction and for the effective international control of atomic energy to ensure its use for peaceful purposes only. The development of atomic and hydrogen weapons by the Soviet Union fundamentally altered the terms of the problem of the regulation and reduction of armaments and resulted in important changes in national positions. In spite of vigorous efforts to achieve constructive results through the commission, through its subcommittee consisting of France, the United Kingdom, the United States, the U.S.S.R. and Canada and through the general assembly itself, there was little progress in working out an acceptable plan.

Peaceful Use of Atomic Energy.—In Dec. 1953, in an address to the general assembly, Pres. Dwight D. Eisenhower offered a new approach to the question of atomic energy, proposing the establishment of an international agency to further the peaceful use of atomic energy. At its ninth session the general assembly, by unanimous vote on Dec. 4, 1954, expressed the hope that "the International Atomic Energy agency will be established without delay," and decided that an international technical conference should be held to explore the peaceful uses of atomic energy. The conference met in Geneva, Switz., Aug. 8–20, 1955, with delegates from 60 members and 23 other states participating. The initiative in drafting a statute for the International Atomic Energy agency was taken by the United States and seven other members—Australia, Belgium, Canada, France, Portugal, the Union of South Africa and the United Kingdom. An agreed draft was submitted to the general assembly at its tenth session, which welcomed the progress made and the decision of the eight to invite Brazil, Czechoslovakia, India and the U.S.S.R. to participate in their discussions. On April 18, 1956, the 12 states reached complete agreement on a draft statute to be submitted to an international conference for discussion and approval.

On Sept. 20 a conference met at United Nations headquarters to draft the statute of the International Atomic Energy agency. On Oct. 23 the statute was approved by the representatives of 82 states. It provided that the new agency should: (1) encourage and assist research on and the development and practical application of atomic energy for peaceful uses; (2) make provision for materials, services, equipment and facilities; (3) foster the exchange of scientific and technical information and of scientists and other experts; (4) establish and administer safeguards to ensure that military purposes will not be furthered by the agency's work; and (5) adopt standards of health and caution in the use of atomic materials for peaceful purposes. A board of governors, composed of from 21 to 25 states, was authorized to carry out the functions of the agency, subject to responsibilities as defined in the statute to a general conference of all members. A director-general appointed by the board of governors was to be the chief administrative officer. The headquarters of the agency was designated as Vienna. The agency was to have the status of an affiliated United Nations body.

Relations Between the Great Powers.—The general assembly made numerous appeals to the great powers to settle matters of international concern on a peaceful basis. In Dec. 1949 the assembly laid down a series of principles which it considered essential for an enduring peace. The assembly also exhorted the permanent members of the Security council to reach agreement on such matters as the admission of new members to the United Nations and to be more moderate in the use of the veto.

Holding of a Review Conference.—Under article 109 of the charter, the question of holding a review conference was placed on the agenda of the general assembly at its tenth session. At its eighth session in 1953 the assembly had anticipated the need of advance preparations if a conference should be held and had directed the secretary-general to prepare certain documents, including a *Repertory of Practice of United Nations Organs*. The assembly decided that a general conference to review the charter should be held at an appropriate time and that a committee consisting of all members of the United Nations should consider, in consultation with the secretary-general, the time, place, organization and procedures of the conference, and that the committee should report in two years.

DEVELOPMENT OF INTERNATIONAL LAW

In Nov. 1947 the general assembly established the International Law commission of 15 members to make recommendations for the progressive development of international law and its codification. In setting up the commission, the assembly directed it to formulate the principles of international law recognized at the Nuremberg trial of Nazi war criminals and to prepare a draft code of offenses against the peace and security of mankind.

In 1950 the commission submitted its formulation of the Nuremberg principles, which covered crimes against the peace, war crimes and crimes against humanity. The commission presented to the assembly in 1951 draft articles on offenses against the peace and security of mankind, which enumerated 12 crimes against international law, including any act of aggression, threat of or preparation for aggression, annexation of territory and genocide. The commission prepared a draft declaration on the rights and duties of states which it had submitted to the assembly in 1949.

The commission made studies of the possibility of codifying certain branches of international law, giving priority to the law of treaties and the law of the sea. Also, it prepared a study on the legal aspects of reservations to multilateral conventions.

ECONOMIC AND SOCIAL CO-OPERATION

A major purpose of the United Nations is "to achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion." The general assembly, the Economic and Social council, along with the council's commissions, the secretariat and the specialized agencies are the organs primarily responsible for action in this field. An important part of the United Nations activity consists of research, publication and the rendering of technical assistance to governments. The United Nations has no authority to legislate or to enforce measures of economic and social co-operation; it can only make recommendations which the member governments may or may not follow.

The Specialized Agencies.—Those who drafted the United Nations charter believed that many areas of economic and social co-operation, while requiring an intergovernmental approach, could be more effectively covered by relatively autonomous functional organizations. Consequently, it was assumed that international co-operation in this field would find expression in a great variety of intergovernmental organizations. Of these, those with "wide international responsibilities" were to be brought into relation with the United Nations as specialized agencies. This relationship might initially be defined by an agreement concluded with the specialized agency by the Economic and Social council subject to general assembly approval. The charter provided that the general assembly and the Economic and Social council should undertake to co-ordinate the policies and activities of the specialized agencies. The general assembly may review and make recommendations subject to the administrative budget of an agency; both the assembly and the Economic and Social council may make recommendations with respect to program. Each specialized agency in fact concluded an agreement with the United Nations defining in general terms its relation to the latter. These agreements contain provisions regarding such matters as reciprocal representation, exchange of information and documents, administrative co-operation, annual reports and action to be taken on general assembly recommendations. An Administrative Committee on Co-ordination, composed of the secretary-general and the executive heads of the specialized agencies, was established by the Economic and Social council to assist in co-ordinating and harmonizing the relations between the agencies and the United Nations.

The general structure of each specialized agency follows a common pattern. There is provision for a general conference in which

all members are represented. The conference elects an executive body which is charged with initiating proposals and carrying out decisions of the general conference. Each agency has a permanent secretariat, headed by a director. Many agencies have regional subcommissions operating in various parts of the world. Some of the specialized agencies were in existence before the United Nations was organized, some were in process of establishment during World War II and some agencies were organized under the auspices of the UN. Those in operation in the mid-1950s were:

International Labour Organization (ILO).—The ILO was established at the end of World War I. Its constitution was incorporated in the peace treaties, along with the covenant of the League of Nations. It survived World War II and was accepted by the United Nations as a specialized agency. An agreement with the UN was approved by the general assembly on Dec. 14, 1946.

The main function of the ILO is the improvement of labour conditions throughout the world. The conclusion of international conventions is one of the principal methods by which it seeks to achieve this purpose. The organization is unique in that its constitution provides for the representation of private organizations (employer and labour) as well as governments in its conference and governing body. Its headquarters are in Geneva. It has 76 members. (*See* also INTERNATIONAL LABOUR ORGANIZATION.)

Food and Agriculture Organization of the United Nations (FAO).—The FAO came into being on Oct. 16, 1945, with the signing of the constitution. An agreement between the FAO and the United Nations was approved by the general assembly on Dec. 14, 1946. The main functions of the FAO are to raise the nutritional levels and living standards of the world's peoples, to secure improvements in production and distribution of food and agricultural products and to better the conditions of country dwellers. The FAO headquarters are in Rome, It. It has 72 members.

United Nations Educational, Scientific and Cultural Organization (UNESCO).—UNESCO came into being on Nov. 4, 1946, on the basis of a constitution drafted and signed at London in Nov. 1945. An agreement between UNESCO and the United Nations was approved by the general assembly on Dec. 14, 1946. The central aim of UNESCO is to achieve international peace through the diffusion and interchange of education, science and culture among all the peoples of the world. Its headquarters are in Paris, Fr. It has 76 members and 4 associated members.

International Civil Aviation Organization (ICAO).—The ICAO came into being on April 4, 1947, on the basis of a convention drafted at Chicago, Ill., in 1944. During the intervening period a provisional organization operated. An agreement between ICAO and the United Nations was approved by the general assembly on Dec. 14, 1946. The ICAO's main functions are the development of principles and techniques of international air navigation and the planning and development of international air transport. Its headquarters are in Montreal, Que. It has 69 members.

International Bank for Reconstruction and Development.—The bank came into being Dec. 27, 1945, on the basis of articles of agreement drafted and signed at Bretton Woods, N.H., in July 1944. An agreement between the bank and the United Nations was approved by the assembly on Nov. 15, 1947.

The main functions of the bank are to assist in the reconstruction and development of member countries by facilitating the investment of capital for productive purposes, to promote the flow of private capital toward international investment and to contribute toward the goal of balanced international trade. The headquarters of the bank are in Washington, D.C. It has 59 members. (*See* BANK FOR RECONSTRUCTION AND DEVELOPMENT, INTERNATIONAL.)

International Monetary Fund.—The fund came into being Dec. 27, 1945, on the basis of articles of agreement drafted and signed at Bretton Woods in July 1944. An agreement between the fund and the United Nations was approved by the assembly on Nov. 15, 1947. The main functions of the fund are to promote stability in the exchange rates of the world's currencies and to assist in the curtailment of competitive practices in exchange depreciation. Its headquarters are in Washington, D.C. It has 59 members. (*See* INTERNATIONAL MONETARY FUND.)

World Health Organization (WHO).—The WHO came into being on April 7, 1948, on the basis of a constitution signed in New York city July 22, 1946. An interim commission functioned during the intervening period. An agreement between WHO and the United Nations was approved by the assembly on Nov. 15, 1947. The main functions of WHO are the eradication of epidemic, endemic and other diseases, the improvement of nutrition, housing, sanitation and other aspects of hygiene, the promotion of maternal and child health and research in the field of private and public health. Its headquarters are in Geneva. It has 84 members and 4 associate members.

Universal Postal Union (UPU).—The agreement between the UPU, originally established in 1874, and the United Nations was approved by the assembly on Nov. 15, 1947. The main function of the UPU is to promote international postal co-operation with a view to improving international postal service. Its headquarters are in Berne, Switz. It has 96 members.

International Telecommunication Union (ITU).—The ITU came into being Jan. 1, 1934, on the basis of a convention signed Dec. 9, 1932, merging the International Telegraph union (established in 1865) and the International Radio-telegraph union (established in 1906). An agreement between the ITU and the United Nations was approved by the general assembly on Nov. 15, 1947. The purpose of the ITU is to establish international regulations for radio, telegraph and telephone services. Its headquarters are in Geneva. It has 91 members and 5 associate members.

World Meteorological Organization (WMO).—The WMO came into being March 23, 1950, replacing the International Meteorological organization which was established in 1878. An agreement between the WMO and the United Nations was approved by the general assembly in Dec. 1951.

The purposes of WMO are to co-ordinate, standardize and improve world meteorological activities and to encourage exchange of meteorological information among its members. Its headquarters are in Geneva. It has 94 members.

Economic Reconstruction.—The devastation of large areas during World War II, and the dislocation of normal economic relations resulted in the need of concerted measures of relief, rehabilitation and reconstruction. The United Nations Relief and Rehabilitation administration, established in 1943, did much to alleviate the situation. To assist in dealing with special regional problems in Europe and the far east, the Economic and Social council established in 1946 the Economic Commission for Europe and the Economic Commission for Asia and the Far East. Particularly after 1947, the Economic Commission for Europe was hampered in its work by the "cold war"; notwithstanding, it provided a useful means of contact between European countries in dealing with their common problems. When war produced a similar need in Korea, the general assembly created the United Nations Korean Reconstruction agency to assist in the rehabilitation and reconstruction of that part of Korea accessible to it.

Technical Assistance.—A modest program of technical assistance was undertaken at an early stage. World attention became centred on the problem with the announcement of Pres. Harry S. Truman's Point Four program. The expanded program for technical assistance was approved by the general assembly in 1949. It was undertaken with a view to raising the standard of living and promoting economic assistance to underdeveloped areas.

Aside from the Technical Assistance administration, a branch of the secretariat, there are two other United Nations agencies with responsibilities in connection with the implementation of this program. The Technical Assistance board, composed of the secretary-general of the United Nations and the executive heads of the participating specialized agencies or their representatives, coordinates operations under the program and makes recommendations on proposed projects to the Technical Assistance committee. The committee, consisting of the members of the Economic and Social council, acts on the recommendations of the board and reviews the working relationships between the co-operating organizations.

The expanded program of technical assistance is financed by voluntary contributions from members. Pledges are made at an

annual conference of members. At the seventh conference, 63 countries pledged more than $29,000,000 for the 1957 program, an increase over previous pledges both in the number of countries participating and the total amount pledged. During the previous six years, $142,000,000 had been contributed.

In its ninth session in 1954 the general assembly approved a new procedure for the adoption of programs and the allocation of funds which was subsequently introduced. This procedure provides for the development of programs on a country basis instead of on the basis of a fixed percentage of the available funds being allotted to each organization. It emphasized the responsibility of the recipient country for establishing priorities in drawing up its proposed program, and placed increased responsibility for coordination on the Technical Assistance board's resident representative in the recipient country.

Financing Economic Development.—The United Nations has given a great deal of consideration to ways and means of making capital available to underdeveloped countries for financing projects which are not self-liquidating or which do not meet the requirements of the World bank for loans. In 1954 the general assembly recommended that both capital-importing and capital-exporting countries examine their policies and practices with a view to encouraging the flow of private capital. In April 1955 the bank submitted to its members the draft charter of the International Finance corporation to come into operation as soon as ratified by 30 states and as soon as 75% of $100,000,000 capital had been subscribed. The corporation was to make direct loans to private enterprise without government guarantees and was to be allowed to make loans for other than fixed returns. The charter entered into force on July 20, 1956. To assist in the financing of nonself-liquidating development projects a proposal was submitted to the general assembly for a Special United Nations Fund for Economic Development (SUNFED). The proposal was considered by the tenth assembly but final action was deferred pending further study by governments and a special committee.

Refugees.—The International Refugee organization, a specialized agency which was established in 1946 and terminated its activities in 1952, took over the refugee functions of the United Nations Relief and Rehabilitation administration which expired in 1947. The IRO was successful in resettling, repatriating, transporting and maintaining more than 1,000,000 European refugees. Since the IRO was conceived as a short-term emergency organization, a new refugee structure was devised in 1951. A United Nations high commissioner for refugees was appointed and was directed to act under the Convention Relating to the Status of Refugees, which was drawn up by the Economic and Social council and approved by the general assembly in 1951. An Advisory Committee on Refugees was appointed by the council in 1951 to assist the high commissioner.

Human Rights.—The general assembly in 1948 adopted the Universal Declaration of Human Rights, which was prepared by the Commission on Human Rights. In 1948 the commission began to draft a Covenant of Human Rights which, upon ratification by governments, would become legally binding upon them. Wide differences in economic and social philosophies hampered efforts to achieve agreement on a common text, but finally a Draft Covenant on Economic, Social and Cultural Rights and a Draft Covenant on Political and Civil Rights were completed in 1954 and submitted to the ninth general assembly for its consideration. In the general field of human rights, the assembly also concerned itself with discrimination against Indian nationals in the Union of South Africa and the violations of civil-rights provisions of peace treaties by Hungary, Rumania and Bulgaria.

Control of Narcotics.—The Commission on Narcotic Drugs was authorized by the assembly in 1946 to carry out the functions entrusted by international conventions to the League of Nations Advisory Committee on Traffic in Opium and Other Dangerous Drugs. The agreements, conventions and protocols on the control of narcotic drugs concluded in 1912, 1925, 1931 and 1936 were amended in a draft protocol which was approved by the assembly in Nov. 1946 and subsequently came into force among its signatories. In addition to re-establishing the pre-World War II system of narcotics control, which had suffered from the dislocations of the war, the UN concerned itself with new problems resulting from the development of synthetic drugs. Efforts were made to simplify the system of control by drafting one convention incorporating the provisions of all agreements in force.

Other Activities.—The United Nations has rendered an invaluable service in the economic and social field by publishing carefully prepared information, statistical data and surveys of recent developments in the economic and social fields. Among the more significant of its publications are the *World Economic Report*, the *Statistical Yearbook*, the *Demographic Yearbook* and the *Yearbook on Human Rights*.

The general assembly established the United Nations International Children's Emergency fund (later styled the UN Children's fund but still officially called UNICEF) in Dec. 1946, to provide for the emergency needs of children in devastated areas. Financed by contributions from member states, UNICEF has been effective in sustaining basic nutritional requirements for destitute children in more than 50 countries, preventing such communicable diseases as tuberculosis, whooping cough and diphtheria and providing for children's clothing and other needs. UNICEF has trained child welfare workers, laid emphasis on milk-conservation programs and worked effectively with the Arab refugees in the middle east. In 1953 it was made a permanent organization.

In addition to matters specifically mentioned above, the United Nations has been concerned with such questions as freedom of information, the status of women, genocide and social policy.

DEPENDENT AREAS

On two different levels, the United Nations maintains concern for people residing in nonself-governing territories: (1) under principles and procedures developed for making administering states internationally accountable for the treatment of their nonself-governing territories; and (2) under the United Nations trusteeship system applicable to certain territories placed under it.

Nonself-Governing Territories.—Under article 73 of the charter, members of the United Nations with responsibilities for the administration of nonself-governing territories agreed to grant the people of such territories political, economic, social and educational advancement, just treatment and protection against abuses; to develop self-government; to further international peace and security; to promote constructive measures of development; and to transmit to the secretary-general information of a technical nature concerning the economic, social and educational conditions in their territories. In 1947 the general assembly created the Special Committee on Information Transmitted under Article 73e of the Charter to receive and analyze information on these territories and to make recommendations to the administering authorities on the basis of information received. Although originally established as an *ad hoc* organ, the special committee became a permanent subsidiary organ of the general assembly.

The general assembly placed emphasis on economic development, raising standards of nutrition and health, and land reform in nonself-governing territories. Furthermore, the assembly encouraged the administering authorities to co-operate with nongovernmental organizations and the specialized agencies in meeting the United Nations' objectives under article 73. A notable achievement in this respect was the conclusion of an agreement in 1951 between the United Kingdom and the United Nations Technical Assistance board which provided for the application of the technical assistance program to dependent areas under British administration.

The Trusteeship System.—The United Nations trusteeship system, successor to the League of Nations mandate system, made provision for bringing the administration of certain nonself-governing territories under international guarantees that certain standards would be observed. The trusteeship system is applicable to former League mandated territories, territories detached from axis states as a result of World War II and territories voluntarily placed under the system by the states responsible for their administration. In order for a territory to be under trusteeship, it is necessary for an agreement to be concluded between the states

"directly concerned," subject to general assembly approval. In practice the administering state has proposed the terms of the agreement which have become operative upon general assembly approval.

At the beginning of 1956 the following territories were under trusteeship with the administering authorities as indicated: the Cameroons (United Kingdom); Cameroun (France); New Guinea (Australia); Nauru (Australia); Ruanda-Urundi (Belgium); Somaliland (Italy); Tanganyika (United Kingdom); Togoland (United Kingdom); Togoland (France); Western Samoa (New Zealand); and the strategic Trust Territory of the Pacific Islands, including the Marianas, Marshalls and Carolines (United States). Efforts made through the general assembly to bring South-West Africa, which had been administered as a mandated territory by the Union of South Africa, under trusteeship or some modified form of international supervision were unsuccessful.

Each trusteeship agreement delineates the authority and obligations of the administering state in the trust territory and provides for the implementation of the powers vested in the organs of the United Nations by provisions of the charter. Strategic areas may be placed under a special regime which vests responsibility for supervision in the Security council and gives the administering authority greater discretionary powers. Each administering authority is required to submit an annual report based on a questionnaire prepared by the Trusteeship council. A representative of the administering state is required to be present when the council examines the report and is interrogated by members of the council after he submits an oral statement. Persons residing in the trust territories or outside may petition to the council with respect to any grievances, complaints or suggestions they may have regarding the administration of the territory.

The Trusteeship council sends visiting missions to each of the trust territories to investigate and report on conditions and the extent to which the administering authority is carrying out its obligations. Missions were thus dispatched to the trust territories in the Pacific, to Western Samoa and to east and west Africa. On the basis of full discussion, the Trusteeship council prepares its report to the general assembly, incorporating recommendations with respect to the administration of the trust territory in question. The general assembly customarily accepts the recommendations of the council. If the administering authority refuses to conform, the organs of the United Nations can do little more than publicize the facts. The United Nations does not have the power to terminate the authority of an administering state for failure to discharge its obligations under the charter. Experience indicated, however, that the administering authorities had taken seriously the constructive criticism and suggestions of the Trusteeship council and general assembly.

The general assembly in its 11th session voted to approve the recommendation of the Trusteeship council that appropriate steps be taken in consultation with the United Kingdom toward terminating the trusteeship agreement for British Togoland, effective with the attainment of independence by the Gold Coast to which it was to be united. The council had taken its decision following the holding of a plebiscite in the territory, under UN supervision and at the request of the United Kingdom, which showed that a majority of the voters desired union with an independent Gold Coast rather than a continuance of trusteeship. The decision of the general assembly signalized the first instance of termination of a trusteeship agreement on attainment of its objectives.

A request by France that the trusteeship agreement for French Togoland be terminated on the basis of French proposals for self-government and the results of a French-sponsored plebiscite was not approved.

ADMINISTRATION AND FINANCE

Personnel.—The secretariat of the United Nations, serving under the secretary-general, is part of the United Nations machinery influencing the day-to-day work of the organization to a degree which the words of the charter would not indicate. The extent of this influence is in large measure a result of the fact that the secretariat members are permanent expert officials. The secretariat staff is recruited on a merit basis but with regard to equitable geographical distribution. In the first two years of the organization's existence, the preponderance of United States nationals on the staff caused considerable concern among many delegations. Consequently, the assembly in 1947 adopted a resolution calling on the secretary-general to study the recruitment policy with a view to improving the geographical distribution of the staff. Members of the organization are required to take an oath of loyalty to the United Nations and are not permitted to receive instruction from member governments. The staff of United Nations headquarters at the beginning of 1955 numbered approximately 3,200, with about 1,500 other members located in Geneva and other parts of the world. In Nov. 1949 the general assembly established a United Nations Administrative tribunal to hear and pass on alleged violations of staff contracts and other conditions of employment in the secretariat. The tribunal is composed of seven members, no two of which may be nationals from the same state. In decisions handed down in 1951 the tribunal established the principle that staff members are entitled to due process when questions of contract renewal are being considered. In 1953 the tribunal handed down awards totaling $179,420 for compensation to 11 U.S. nationals who had been dismissed by the secretary-general after they had refused to answer questions regarding espionage before U.S. investigatory agencies. On being asked by the general assembly whether it was bound by these decisions, the International Court of Justice gave an opinion in the affirmative in July 1954. The assembly in its ninth session accepted the awards but established a system of review of tribunal decisions involving acceptance by the interested parties of opinions of the International Court when requested by a special committee.

A United Nations Field service and a United Nations Panel of Field Observers were organized by the assembly in 1949. The Field service performs security functions for United Nations missions in many parts of the world, and the Panel of Field Observers assists the various missions in supervising truces and observing plebiscites. Both are under the secretary-general.

Finance.—The secretary-general must submit an annual budget including estimated expenditures to the general assembly for approval. After estimates have been made by each branch of the secretariat and submitted to the secretary-general, he compiles his annual budget estimates which he presents to the general assembly before each annual session. The United Nations' annual budget began at $19,390,000 for 1946, rose to $49,869,450 for 1953 and then declined slightly. The budget for 1956 was $48,566,350.

The charter stipulates that the expenses of the organization shall be borne by members as apportioned by the general assembly. The Committee on Contributions prepares a scale of assessments for each member, based on the general economic level and capacity of each state, which is submitted to the general assembly for approval. The United States is the largest contributor. Its assessment began at 49% of the total but at the request of the United States government was steadily reduced until in 1954 it was 33.33%, in conformity with a resolution adopted by the general assembly that no member should contribute more than one-third of the total.

Privileges and Immunities.—A General Convention on Privileges and Immunities of the United Nations approved by the general assembly in Feb. 1946 asserted that the UN possesses juridical personality. It provides for such matters as the immunity from legal process of the property and assets of the United Nations and for the privileges and immunities of the representatives of members, officials of the United Nations and experts on missions of the organization. A headquarters agreement between the UN and the United States was signed in June 1947, defining the privileges and immunities of the United Nations headquarters in New York city.

Headquarters.—The general assembly decided during the second part of its first session in New York to locate its permanent headquarters in that city. John D. Rockefeller, Jr., made a gift of land for a building site in Manhattan, and a loan of $65,000,000 from the United States permitted plans to be initiated for the construction of permanent buildings. Temporary headquarters were established at Lake Success. The Secretariat building was completed and occupied in 1951. The building providing accommodations for the general assembly and the councils was completed and occupied in early 1952.

In 1947 the assembly adopted a United Nations flag. Its design

consists of the official emblem of the United Nations in white, centred on a light-blue background. The assembly also designated Oct. 24 as United Nations day. (L. M. Gh.; A. Vh.)

UNITED PRESBYTERIAN CHURCH (of Scotland). This Presbyterian organization, merged since 1900 in the United Free Church of Scotland (*q.v.*), was formed in 1847 by the union of the United Secession and Relief Churches. The general causes which led to the first great secession from the Church of Scotland, as by law established in 1688, are indicated in the article Scotland, Church of. Its immediate occasion rose out of an act of assembly of 1732, which abolished the last remnant of popular election by enacting that, in cases where patrons might neglect or decline to exercise their right of presentation the minister was to be chosen, not by the congregation, but only by the elders and Protestant heritors. The act itself had been passed by the assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were rejected. The protests however were vigorously renewed by Ebenezer Erskine, minister of Stirling. He was soon joined by other ministers, who in Dec. 1733 constituted themselves into a presbytery, disowning the authority of the general assembly. The members of the Associate Presbytery and its adherents steadily increased, until in 1745 there were 45 congregations under its jurisdiction, and it was reconstituted into an associate synod. A violent controversy respecting the religious clause of the oath taken by burgesses in Edinburgh, Glasgow and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), resulted in April 1747 in a breach, when two bodies were formed, each claiming to be the Associate Synod; those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Anti-burghers," while the other party, who contended that abstinence from it should not be made a term of communion, were designated "Burghers." The Associate (Anti-burgher) Synod held its first meeting in Edinburgh on April 10, 1747. It grew with considerable rapidity, and for purposes of organization was formed into four provincial synods, and took the name of the General Associate Synod. The Associate (Burgher) Synod held its first meeting at Stirling on June 16, 1747. The number of congregations under its charge also increased; and in 1820 the General Associate or Anti-burgher Synod (to the number of 129 congregations) united with the 154 congregations of the Associate or Burgher Synod. The body thus constituted, the United Secession Church, had increased by 1847 to 400 congregations.

In 1847 a union was formed between all the congregations of the United Secession Church and 118 out of 136 of the Relief Churches, in what now became the United Presbyterian Church. Doctrinally there was little difference between the United Presbyterian Church and the Free Church of Scotland, and between 1863 and 1873 negotiations were carried on for a union, which however were fruitless. In 1896 the United Presbyterian Church again made advances which were met, and on Oct. 31, 1900, the United Free Church of Scotland came into existence.

UNITED PRESS ASSOCIATIONS. Known generally as the United Press, the United Press Associations is an independent U.S. news service gathering and distributing news dispatches, news pictures and news film throughout the world. Its more than 4,800 clients in the mid-1950s were principally newspapers and radio and television stations.

It was founded in 1907 by E. W. Scripps, who united the Scripps-McRae Press association, the Scripps News service and the Publishers' Press association, three regional news services in the United States. It is not related in any way to an earlier United Press which ceased operating in 1897.

There are 205 U.P. bureaus in the United States and in 78 countries and their territories and colonies. The news service employs more than 10,000 correspondents, reporters, photographers, editors, telegraphers and technicians. Its dispatches are translated into 48 languages. Besides using cable, telegraph and wireless routes, the United Press leases nearly 400,000 mi. of wires in North America and Europe and 250 short-wave radio transmitter hours daily for the collection and dissemination of world-wide news.

Supplementing the basic United Press news service are others providing special kinds and quantities of news and newspaper features. The Washington Capital News Service-Executive News Service supplies government reports, local news and high lights of world events to government offices, executive and special correspondents in the U.S. capital. The Ocean Press transmits news bulletins to ships at sea. The Special Service bureau gathers material on particular topics for magazines and radio commentators. United Press Newspictures provides news photographs to newspapers and television stations. In collaboration with 20th Century-Fox Film corporation, United Press Movietone News supplies motion-picture news film, news scripts and a continuous news report to television stations. The largest U.P. subsidiary, United Feature Syndicate, distributed comics, columns, cartoons and nonfiction series in the mid-1950s to about 1,350 newspapers. The auxiliary British United Press serves newspapers and broadcasters in the United Kingdom and Canada. (F. H. Bw.)

UNITED PROVINCES, the name by which the state of Uttar Pradesh (*q.v.*) in the republic of India was known under British administration from 1937 and until the establishment of the republican constitution in 1950. During 1902–37 the full title of the province was the United Provinces of Agra and Oudh.

History.—If the boundaries of the United Provinces had been slightly extended in either direction so as to include Delhi and Patna, they would have contained the area on which almost the whole drama of Indian history has been played. There lay the scene, known as Madhya Desa or "middle country," of the second period of Aryan colonization, when the two great epics, the Mahabharata and Ramayana, were probably composed and when the religion of Brahmanism took form. There Buddha was born, preached and died. There arose the successive dynasties of Asoka, of the Guptas, and of Harsha. There ruled the Mogul for his most brilliant period at Agra and at Fatehpur Sikri. There finally, at the crisis of the mutiny, British dominion was established in India.

The political vicissitudes through which this tract of country passed in earlier times are described under India: *History*. It will be sufficient here to trace the steps by which it passed under British rule. In 1765, after the battle of Buxar, when the nawab (the native ruler) of Oudh had been decisively defeated and Shah Alam, the Mogul emperor, was a suppliant in the British camp, Lord Clive was content to claim no acquisition of territory. Oudh was restored to the nawab with the exception of the two districts of Kora and Allahabad in the lower Doab which were handed over to the Mogul emperor for the upkeep of his dignity and expenses. Warren Hastings augmented the territory of Oudh by lending the nawab a British army to conquer Rohilkhand and by making over to him Allahabad and Kora on the ground that Shah Alam had placed himself in the power of the Marathas. In 1775 he received from Oudh the sovereignty over the province of Benares. Lord Wellesley in 1801 obtained from the nawab of Oudh the cession of Rohilkhand, the lower Doab and the Gorakhpur division, thus enclosing Oudh on all sides except the north. In 1804, as the result of Lord Lake's victories in the Maratha War, the rest of the Doab and part of Bundelkhand, together with Agra, were secured from Sindia. In 1815 the Kumaon division was acquired after the Gurkha War, and a further portion of Bundelkhand from the peshwa (hereditary sovereign) in 1817. These new acquisitions, known as the ceded and conquered provinces, continued to be administered by the governor general as part of Bengal. In 1835 an act of parliament authorized the appointment of a lieutenant governor for the North-Western Provinces, as they were then styled. They included the Delhi territory (transferred after the mutiny to the Punjab) and also (after 1853) the Saugor and Narbada territories, which in 1861 became part of the Central Provinces. Meanwhile Oudh remained under its nawab, who was permitted to assume the title of king in 1819, until it was annexed in 1856 and constituted a separate chief commissionership. Then followed the mutiny, when all signs of British rule were for a time swept away throughout the greater part of the two provinces. The lieu-

tenant governor died when shut up in the fort at Agra, and Oudh was only reconquered after several campaigns lasting for 18 months. (*See* INDIAN MUTINY.)

In 1877 the offices of lieutenant governor of the North-Western Provinces and chief commissioner of Oudh were combined in the same person; and in 1902, when the name of United Provinces of Agra and Oudh was introduced, the title of chief commissioner was dropped. In 1920 the tract was created a governor's province. In the decades immediately preceding India's independence the peaceful life of the province was to some extent disturbed by the powerful movement for *swaraj* or home rule. The United Provinces played an active part in this movement, and one of its leaders was Jawaharlal Nehru (*q.v.*), who became prime minister of the republic of India.

As a result of the Government of India act, 1935, the province became autonomous in 1937, and was created a state under the name of Uttar Pradesh when India achieved independence within the British Commonwealth in 1947.

UNITED PROVINCES OF AGRA AND OUDH: *see* UNITED PROVINCES; UTTAR PRADESH.

UNITED STATES (OF AMERICA), THE, the foremost nation of the western hemisphere in the number and wealth of its people, and the third largest in area. It is situated advantageously in the temperate zone of the North American continent (approximately 24° 30′ to 49° N. lat.), and extends in a broad belt from the Atlantic ocean on the east to the Pacific ocean on the west (approximately 66° 57′ to 124° 45′ W. long.). On the north it is bordered by Canada, the boundary in the west being an arbitrary line at the 49th parallel and in the east largely a natural one formed by the Great Lakes. The eastern half of the southern boundary is naturally defined by the Gulf of Mexico, but in the west the nation is separated from Mexico by an oblique line following first the Rio Grande river and continuing afterward generally west-northwest across the highlands to the Pacific ocean.

The eastern coast is separated from Europe by approximately 3,000 mi. of the Atlantic ocean which acts as a carrier for an enormous commerce between the two continents, but which, at the same time, gives the United States a degree of isolation from European affairs which contributed greatly to its independent growth and progress. The Pacific ocean which separates the United States from the oriental nations of the far east is wider, varying from 5,000–6,000 mi., but in the Hawaiian Islands the United States acquired possession of an important midway stepping stone.

The United States consists of 48 separate and theoretically sovereign states joined together by a federal government to which the original 13 states delegated certain powers as outlined in the federal constitution adopted in 1787 and put in force in 1789. The official name "The United States of America" is in general usage shortened to "United States," the term being used in the singular instead of a plural sense. The total area of the nation is 3,022,387 sq.mi. (2,974,725 sq.mi., land only). Its population in 1950 was 150,697,361, or 50.6 per square mile. In 1940 the population was 131,669,275, or 44.2 per square mile; in 1930 it was 122,775,046 or 41.1 per square mile; in 1920, 105,710,620 or 35.5 per square mile. Outlying possessions with a total area of 534,040 sq.mi. had a population in 1950 of 3,406,971.

I. PHYSIOGRAPHY

Plan of Relief.—The primary features of the United States are: (*a*) a vast western highland covering a full third of the country, dominated by mountains of which the general trend is a little west of north, (*b*) a smaller and lower eastern highland south of the St. Lawrence river, trending north-east–south-west, roughly parallel to the Atlantic coast, (*c*) a broad interior plain sloping southward and interrupted by the smaller interior highland, and (*d*) a lowland belt bordering the Atlantic and the Gulf of Mexico.

Major Physiographic Divisions.—The eight major divisions are as follows, the order being determined by the numbering of the physiographic provinces on the map (p. 720) and in table pages 721 and 722: *A*,—the Laurentian Upland covers most of eastern Canada and only a small part of the United States south of Lake Superior; *B*,—the Atlantic Plain embraces the Atlantic and Gulf coastal plains; *C*,—the Appalachian Highlands extend from the St. Lawrence south-west to the Gulf coastal plain with an average width of 300 miles. *D*,—the Interior Plains are bordered east and west by the great highlands of the continent and partly enclosed on the north by the Laurentian highland, but west of that they extend north to the Arctic ocean. On the south these Interior plains give way to the Gulf coastal plain but not without a distinct descent. *E*,—the Interior Highlands are surrounded by plains, the Interior plain on the west and north, and the Gulf coastal plain on the east and south. *F*,—the Rocky Mountain System enters the United States from Canada and extends south to latitude 36°. This system carries the main continental divide and, while not bearing the highest peaks, affords the greatest mass of land at high levels on the continent. *G*,—the Intermontane Plateaux west and south of the Rocky mountain system, occupy approximately half a million square miles, most of it at high altitudes and half of it ribbed by mountains. *H*,—the Pacific Mountain System occupies a strip about 200 mi. wide along the Pacific coast, embracing several distinct ranges and important valleys. *See* map, page 720 and table, page 721.

Rivers and Harbours.—In a very general way the major divides follow the great highlands, hence the rivers entering the Atlantic between the St. Lawrence and the Gulf of Mexico are of moderate size and of little direct value to navigation. Their indirect value is great, however, because all their valleys were carved when the continent stood at a higher level. Subsidence of the land drowned the lower courses of streams, making estuaries and harbours as at New York, Baltimore and all the other Atlantic seaports. The Hudson was drowned to Albany and the Delaware to Trenton, permitting ocean vessels to reach Philadelphia. Chesapeake bay is the largest indentation thus made. One of its branches, the Potomac, is at sea-level as far up as Washington.

The St. Lawrence system embraces the five Great Lakes on the Canadian border. The divide limiting the drainage basin of these lakes on the west and south is not far from their shores, hence all tributary streams are short. But the mouths of these streams have likewise been drowned by the tilting of the basin in such a manner that the south-western shores of these lakes are being progressively submerged while the north-eastern shores are rising. Milwaukee, Chicago, Toledo and some other ports owed their original harbours to this cause. The extraordinary harbour of Duluth lies behind a sand bar which has cut off the western end of Lake Superior.

Five-twelfths of the United States (1¼ million sq.mi.), mainly in the Interior plains, drain to the Mississippi and its branches. These afford thousands of miles of navigable water, chiefly on the main stream and its tributaries from the humid east. The Ohio is the most navigated stream in America. New Orleans is a river city 100 mi. from the Gulf; it is a seaport only in the sense that sea-going vessels can reach it. Mobile and some other Gulf ports are on drowned valleys altered and supplemented by artificial works. A small estuary at Galveston is fronted by a broad sand reef on which the city stands.

The Mississippi river has received much attention on account of navigation and flood prevention. More than three-fourths of its water comes from three main streams, the Missouri, the Upper Mississippi (above the mouth of the Missouri) and the Ohio. Their several contributions are approximately as follows:

	Drainage area (square miles)	Average discharge in second-feet	Percentage of total discharge
Upper Mississippi	171,500	127,000	18·27
Ohio	202,000	300,000	43·17
Missouri	530,000	100,000	15·83
Entire Mississippi	1,240,000	695,000	..

The Missouri drains the largest basin but has the least rainfall, hence its volume is least. Each year the Mississippi carries to the sea 340,500,000 tons of solid matter in suspension and 136,400,000 tons in solution. Erosion would thus reduce the level of the entire drainage basin by one foot in 6,000 years.

West of the continental divide on the Rocky mountains are two long rivers, the Snake-Columbia in the north and the Colorado in the south, which traverse the full width of the Intermontane plateaux. Other streams are short and the total amount of water reaching the Pacific is small in proportion to the great area drained. In this part of the United States, chiefly in the States of California, Nevada, Utah and Arizona, and in the adjacent part of Mexico, is a vast area too arid to drain to the sea, comprising 3·2% of the area of the continent or nearly a quarter of a million square miles. The Pacific shore, like the Atlantic, has suffered submergence, drowning the lower courses of most streams. Thus was made the harbour of Portland, Oreg., on Columbia river, 100 mi. from the sea. The local subsidence that made San Francisco bay came at a point where the chief rivers of California break through the Coast ranges to the Pacific. Puget sound, with Seattle, Tacoma and other harbours, is similar to San Francisco bay. San Diego, near the Mexican border, owes its harbour to the protection of a magnificent sand reef.

Atlantic and Gulf Coastal Plain.—South of New York, the continent slopes almost imperceptibly to the shore, beyond which the sea bottom continues the very gentle slope many miles, and then descends less gradually to the oceanic abyss. The line where this relatively rapid descent begins is the real edge of the continent and this margin of shallow sea bottom is the continental shelf. Within this margin is deposited most of the sand and mud carried down from the land. A large part of the ocean's life is concentrated on this shallow bottom where the water is relatively warm and food is abundant.

Repeatedly in late geologic time this border of the continent has stood lower, and also higher, than at present, thus broadening and narrowing the continental shelf alternately. The part of the shelf above water at any one time is coastal plain. All that is shown on the map (p. 720) as coastal plain has been continental shelf at a time so recent that its structure remains unchanged. The materials of its underlying strata are the same as those now accumulating beneath the adjacent shallow sea. Some of the sand, clay and ooze has been poorly consolidated into sandstone, shale or limestone. All beds dip faintly seaward, the older and lower ones passing seaward beneath the younger beds, so that the several formations appear at the surface in strips parallel to the coast, the lower beds outcropping farthest inland. As the beds offer unequal resistance to erosion and are unlike in their soil-making properties, the striped pattern of the geologic map is apt to be reproduced in the topography of the coastal plain.

Topography.—As the surface of the continental shelf is extremely flat, so also is the land nearest the coast, which has but recently emerged and lies too near sea-level to favour the cutting of valleys. The landward edge of the coastal plain was necessarily first to emerge from the sea. It is also the highest. For both of these reasons it is more deeply eroded and more completely dissected by small streams than is the seaward edge. In the southern States this inner edge is at places more than 700 ft. above the sea and has a relief of 300 to 400 feet. At places erosion has even made new lowlands or peneplains. Other things equal, the number and depth of valleys increase inland.

Where the underlying strata resist erosion unequally, a strong stratum may give rise to a cuesta, a ridge with a very gentle slope down dip towards the sea and a steeper slope cutting across the strong stratum and leading down to an "inner lowland" on the underlying weak stratum. The effect on topography is to make the *belted coastal plain* wherein the stronger beds (usually sandy) make higher, rougher and less fertile belts and the weaker beds (usually clay, marl or "chalk") make belts of smooth, fertile lowland. Thus central Alabama has its well known "Black Belt" on the outcrop of the Selma chalk (Cretaceous) which erosion has reduced to a lowland with a rich black soil, famous for its cotton. Dipping seaward, the chalk passes under stronger sandy beds which are poor soil makers, hence the rich lowland is paralleled by a broad, now much dissected cuesta of poor upland. Another lowland and another upland follow but are less well known. Northern Texas has a similar belt, the "Black Prairie," along the western boundary of the coastal plain. It is likewise on a chalk outcrop and has on its seaward side an infertile cuesta. New Jersey has a similar lowland on the weak Raritan clays which outcrop along the landward edge of the coastal plain. From Trenton south-westward this low strip is followed by Delaware river. North-east from Trenton it is followed by the great railroads running from New York to Philadelphia.

Islands.—It will be observed that the coastal plain is broadest at the south and narrows toward the north. The opposite is true of the continental shelf, indicating that the continent is now relatively depressed at the north and elevated at the south. One effect of this is seen in the islands from New York to Cape Cod. These islands, Staten, Long, Block, Martha's Vineyard and Nantucket, are disconnected fragments of the coastal plain, parts of one or more cuestas whose corresponding inner lowlands are submerged. The low strip described across New Jersey is continuous with Long Island sound. The same weak clays underlie both.

Coastline.—Throughout the Atlantic and Gulf coast recent (not necessarily current) sinking is in evidence. From New England to Texas the smaller streams have estuaries, as the larger ones had also until filled by sediments. North of southern Virginia all the major streams crossing the coastal plain are drowned across its entire width. The numerous large estuaries from New York to North Carolina make that part of the coast extremely ragged or crenulated. Sand reefs or barrier beaches form a nearly straight "outer coast" and these continue most of the way from Long Island to Mexico. They are especially long and continuous along the coast of Texas where tides are weak.

The peninsula of Florida is due to an uplift of the sea bottom on an axis almost at right angles to the outline of the continent. Its southern third is so little above sea-level that valley cutting is all but impossible. Here are the vast Everglades (*q.v.*), swamps whose water surface is less than 20 ft. above the sea. Its most valuable part is a low limestone ridge on the Atlantic side, bearing Miami and other winter resorts. On this ridge and a line of coral reef wrapping around the southern end of the peninsula was the now abandoned Florida East Coast railroad. The northern part of the peninsula has suffered some erosion. Its underlying limestone suffers solution, giving rise to many sinkholes, some of them clogged and making lakes of considerable size. Here are the largest deposits of phosphate rock in eastern United States.

Mississippi Embayment.—In the vicinity of the Mississippi river the coastal plain is greatly widened, extending north in a pronounced embayment to southern Illinois. The greater part of this area is occupied by the alluvial plains, 40 to 80 mi. wide, of the Mississippi and its tributaries. At the south this plain merges with and includes the great protruding delta, the entire alluvial plain covering an area of nearly 30,000 square miles. A large part of it is subject to flooding, or would be if not protected by artificial levees. The breaking of the levees in 1927 allowed most of the area to be inundated, the river at Arkansas City, Ark., rising at one time to 60.5 feet. The natural levees are at places 15 to 20 ft. above the back swamps. Slopes of 5 ft. per mile from the

river are common. Slopes of 10 and even of 12 ft. are known.

Piedmont and Blue Ridge Provinces.—Inland from the Atlantic coastal plain is a belt underlain mainly by very old rocks, much deformed, generally metamorphosed and resistant. This belt extends from central Alabama northeastward into Canada, but the part to be described here terminates at the Hudson river. Its greatest width in the south is nearly 200 mi., but north of the Potomac river it averages barely 60 mi. This relic of the early Palaeozoic continent is marked now by a mountain range on its northwestern side. From southern Pennsylvania, where it is called South mountain, to southern Virginia, where it is called Blue Ridge, it is rarely more than 10 or 15 mi. wide and from 1,500 to 3,000 ft. high. In North Carolina and adjacent states it broadens to 70 mi. and culminates in Mt. Mitchell (6,684 ft.), the highest point in eastern United States. The range is interrupted by a short gap in southern Pennsylvania. Northeastward from this gap it is known as the highlands of New Jersey and New York. This part, being detached from the main range (Blue Ridge province) and contiguous with the New England province, which is largely of the same character, is considered a part of the latter. From New England to southern Virginia the crest, as viewed from a distance, is gently undulating and is considered to be the remains of an uplifted peneplain preserved by the strength of the rocks, while weaker rocks on both sides have been reduced to a new and lower peneplain. In western North Carolina the ancient mountains were not all worn down to the peneplain indicated by the crest farther north. Partly for this reason and partly because of greater recent uplift these mountains are several thousand feet higher.

Between the mountains and the coastal plain is the Piedmont province, most of it a low plateau sloping seaward, consisting in the main of the same rocks found in the mountains. Where the rocks of the piedmont and mountain belts are similar the existence of a newer and lower peneplain in the former and not in the latter is explained by the fact that the new peneplain developed first along the lower courses of streams flowing from the mountains to the sea. It spread westward, its limit of advancement being the eastward slope of the Blue Ridge. This newer peneplain is itself uplifted and dissected by revived streams. Much of the northern end of the Piedmont province in Pennsylvania and adjacent states is exceptional, consisting of softer Triassic rocks. As these were more readily worn down and, as already pointed out, the continent in this latitude has been less uplifted, this part of the Piedmont province is lowland rather than plateau, though still distinctly higher than the coastal plain. Taken as a whole, the rocks of this province are not very good soil makers, but the position, especially of its northern part, favours intensive cultivation. Parts of the upland farther south are adapted to fruit trees and an important cotton district in South Carolina is in this province.

New England Province.—The New England province is a broadened northeastward extension of the belts already described. It has the same rocks along with some younger Palaeozoics, generally deformed, metamorphosed and peneplaned. Residual mountains rising above the general level to an altitude of 4,000 to 6,000 ft. are found in the Green mountain section of Vermont and Massachusetts and the White mountain section of New Hampshire and Maine. Between and around these mountains the upland level is generally a little above 1,000 ft., studded here and there with isolated residual mountains or "monadnocks," the original Mount Monadnock being in southwestern New Hampshire. This upland is an uplifted peneplain, itself dissected by sharp valleys since uplift. The surface declines seaward to the "Seaboard lowland" and it is probable that newer and lower peneplains are here represented. The coastal margin below a level of 500 ft. has a rolling surface with wide open valleys in contrast with the narrow and steeper valleys that incise the plateau. The land below 500 ft. also includes the broad valley of the Connecticut river carved from Triassic rocks and analogous in most ways to the low northern end of the Piedmont province. With this valley included, the relatively narrow seaboard lowland contains the greater part of New England's population and industry.

Elevation was followed by depression and the valleys are drowned. This is typically shown on the coast of Maine where the style of depressed coast line is quite different from that of the coastal plain because of difference in topography previous to drowning. Outlying islands, formerly hills or mountains of hard rock, are abundant there. Harbours are numerous and fishing is favoured by this as well as by the broad continental shelf.

Unlike the Piedmont and Blue Ridge provinces, New England was severely glaciated, its mountains overridden and scraped by the continental ice sheet, and its surface generally covered by ice-laid drift abounding in boulders. Some of its valleys are partly filled with sandy outwash. Both topography and the stony soil are unfavourable to agriculture. The northern part of the province was long the great lumbering district of eastern United States. One of the chief effects of glaciation was the dislocation of streams. Drainage, in beginning anew, was obliged to fill many basins and cross many rocky ledges. Lakes and rapids, therefore, abound, the latter being a great source of power. New England, with its poor soil, abundant water power and excellent harbours early developed manufacturing and commerce.

The Adirondacks.—In its physical geography the Adirondack area in northern New York is much like northern New England, a combination of subdued mountains and hilly plateaux, all severely glaciated and abounding in lakes. Like the White mountains and New England coast it is much used as a summer resort. The state of New York has reserved large areas of forest.

Appalachian Ridge-and-Valley Province.—West of the Piedmont, Blue Ridge and New England provinces is a narrow belt of folded sedimentary rocks stretching from the St. Lawrence valley to the Gulf coastal plain. The length is 1,000 mi. and the width rarely 75 mi., more often half that amount. Between New England and the Adirondacks it is very narrow. In its present state this belt consists of alternating ridges and valleys, the former being parallel, even-topped and rarely 3,000 ft. high. For the most part they are nearly straight and in line with the major belt but a zigzag pattern appears in Pennsylvania. The valleys occupy more than half the space. Throughout its length the Palaeozoic sandstones, shales and limestones are folded and often faulted by great lateral compression which made mountains of great height. The ridges now seen are not those made by the folding. Those lay far above the level of the present mountain tops. Even the synclinal trough bottoms were above the present crests. All were eroded away to a peneplain covering this and adjacent provinces. At the time of its making it could not have been, at highest, more than a very few hundred feet above the sea. The tilted strata came to the surface of this plain in parallel strips. Later came a general rise of the whole Appalachian region and the limestones and shales were worn down to a new and lower level (often a peneplain) while the sandstones, being stronger, along with the hard rocks of the Blue Ridge province and the sandstone-capped plateau on the west, retained more nearly their former level. The tops of the even-crested ridges indicate the old peneplain somewhat uniformly worn down.

The greatest breadth of this Ridge-and-Valley province is in Pennsylvania where it is almost 90 mi. From here to southern Virginia the eastern third or fourth is almost without ridges. Its several parts from the Lebanon valley in Pennsylvania to the Shenandoah valley in Virginia are well known for their agricultural wealth. In this central portion the master streams cross the belt transversely, their longitudinal tributaries being developed on the softer outcrops. In the northern section of the province, Hudson-Champlain valley, and again in the southern section, Valley of East Tennessee and neighbouring states, the main streams are longitudinal. In the latter case this probably came about by the headward elongation of the Tennessee river capturing the former streams which flowed from the Blue Ridge to the Ohio.

Appalachian Plateaux.—West of the Ridge-and-Valley province is a plateau of almost equal length with a minimum width of 35 miles at the south but more than 200 miles wide farther north. On the side toward the Ridge-and-Valley province, it is at least as high as the ridges already described, 2,000 to 3,000 ft., but it declines northwestward and is barely 1,000 ft. high where its edge approaches Lake Erie. Its rocks are almost horizontal, generally outcropping on the southeast in an escarp-

ment overlooking the adjoining valley of the folded province. Except at the north end the rocks at the surface are Carboniferous and Permian. Thick beds of strong sandstone are common and generally cap the hills. Soils, therefore, are generally not good. They are least fertile at the south end where the sandstones are most dominant, and best at the north end where Devonian rocks form the plateaux and glaciation has left its heterogeneous drift.

The larger part of the province is almost or quite completely dissected by stream valleys. These may approximate 1,000 ft. in depth on the higher south-east side, but the relief diminishes toward the north and west. Nevertheless the hilltops are about at the same altitude and the horizon is nearly level. The Cumberland plateau at the southern end, mainly in Tennessee, is exceptional in preserving large patches of undissected upland on beds of strong sandstone. In parts of the eastern margin the beds are mildly folded though not enough to develop the topography of the next province to the east. The elevation is less uniform than elsewhere in this province and the horizon less level. As these are also places of greater height these districts are known as mountains, the Allegheny mountains in Pennsylvania, and the Cumberland mountains in Kentucky and Virginia, but these names are applied somewhat broadly, and without exact boundaries, to the deeply dissected eastern margin. The Catskill mountains in south-eastern New York are like the adjacent plateau but covered by an additional thick plate of strong conglomerate now deeply and maturely dissected. The plateau in New York, and to some extent in Pennsylvania and Ohio, was glaciated, leaving the hills and valleys less angular; leaving also many lakes and displaced streams, some of which in carving new valleys have made picturesque falls and gorges. The main plateau ends at the north in an escarpment not far south of the 43rd parallel and 600 to 1,000 ft. high. West of Rome, N.Y., this escarpment overlooks the lacustrine plain along Lake Ontario, a part of the central lowland. East of Schenectady the descent from the plateau is to the valley of Hudson river (Ridge-and-Valley province). Between these two cities, the descent is only to a lower bench of the plateau province. In this bench Mohawk river has cut its valley connecting the two lowlands named. As all strata here dip slightly southward, the valley of the Mohawk is a strike valley. It is the greatest avenue of travel and commerce between the Atlantic coast and the central lowland.

The glaciated northern portion of the Appalachian plateau is favoured agriculturally and is one of the leading dairy districts of the United States. The remainder of the province is almost co-extensive with the great Appalachian coal fields, 75,000 sq.mi. in extent. As this area was never folded the coal remains bituminous. In the province to the east the folds were so high that the carboniferous beds, being uppermost, were almost wholly eroded away. Only in a few small spots were the synclines so deep as to leave the coal below the base level of erosion. Here the coal was metamorphosed to anthracite. The total original area of the anthracite fields was 484 square miles. In the central part of the plateau province are also the great Appalachian oil and gas fields.

Interior Low Plateaux.—West of the southern part of the Appalachian plateaux is a lower plateau province, mainly in the States of Kentucky and Tennessee. At its eastern edge it abuts against the western escarpment of the Cumberland plateau. Here the lower plateau is 1,000 to 1,400 ft. high and scored by valleys between which the surface is little eroded. The ragged escarpment of the Cumberland plateau rises 800 ft. higher. Everywhere the level of the Interior Low plateau declines toward Ohio river, near which in western Kentucky the uplands are little more than 500 ft. high. Dissection by streams increases toward the west end where it is complete. The upland level in most of the province, except in the north-west, is approximately that of the Lexington (Highland Rim) peneplain which covers much of the continental interior. It is developed here on Mississippian (Lower Carboniferous) rocks. Two low structural domes were thus truncated, the Nashville in Tennessee and the Cincinnati anticline, partly in Kentucky. Ordovician (Lower Silurian) limestones were exposed in each, affording excellent soils. In Tennessee these soluble rocks were later cut down 500 ft. making the fertile Nashville basin, surrounded by steep slopes rising to the relatively barren Highland Rim. The "Bluegrass Region" in Kentucky preserves, in the main, the general level of the peneplain but is overlooked on the east by the Cumberland plateau, and on the south by a narrow monoclinal rim remaining from the former dome. In the central Bluegrass district are exposed the oldest rocks and the best soil-makers of the Cincinnati anticline. Western Kentucky embraces the south end of a great coal field with its centre in Illinois. Here is a broad, faint syncline in which the upper Carboniferous rocks were sufficiently depressed to escape the erosion that stripped them away from neighbouring areas. Here again, in western Kentucky, the soil is better.

Central Lowland and Superior Upland.—The term lowland is not capable of exact definition. As applied to north central United States it signifies that most of the area is not obviously much above the level to which streams can cut down.

Within this great province, roughly one-fourth of the United States, the chief contrasts in topography are determined by glaciation. The entire province may be divided into six sections. Two of them were never covered by the ice; two of them were left after glaciation as relatively smooth till plains without lakes; two others were left with abundant moraines and undrained basins. Referring to the accompanying map and table, the Great Lake section (12*a*) has a topography controlled in detail by its thick glacial deposits, though its large features betray the relief of the underlying rock as carved by pre-glacial drainage. Terminal and recessional moraines and outwash deposits, with morainic lakes and swamps, cover perhaps half of the area; the other half is till plains (ground moraine) and lacustrine plains. The beds of all the Great Lakes, except Superior, follow belts of weak strata which were presumably lowlands in pre-glacial time and were deepened by glacial erosion. As the ice front retreated northward from the Mississippi-St. Lawrence divide, lakes formed between the divide and the ice. With further retreat of the ice these lakes expanded and merged, changing from time to time in shape, altitude and outlet but generally discharging into the Mississippi system. When the vanishing ice covered only the St. Lawrence the lakes discharged for a time through Mohawk valley to the Hudson. As each newly discovered outlet lowered the lake levels the water was progressively withdrawn from the farther ends of the basins and the old lake bottoms at the heads of the lakes (south or west ends) were laid bare. An important though minor part of this Great Lake section consists of these perfectly flat former lake bottoms. The glaciation of this section was in the last, or Wisconsin, ice epoch and the surface has been little altered by erosion. Lakes and swamps are beginning to disappear but stream systems are poorly developed. West of Lake Michigan, in this section, is the leading dairy district of the United States.

The Western Young Drift (12*b*) in Minnesota, northern Iowa and the Dakotas is similar but with a smaller proportion of morainic topography. It has also a smaller rainfall, so that forests are limited to northern Minnesota. An important feature of this section is the great lacustrine plain of former Lake Agassiz in the valley of Red river. This valley was flooded when the retreating ice cap obstructed the drainage to Hudson bay. The lacustrine plain (most of it in Canada) is now the greatest area of spring wheat production in America.

The two sections already described are separated by the Superior Upland and the Wisconsin Driftless Area. The former, as compared with the other sections, is higher, is less deeply covered with drift, has a larger number of lakes and vastly more swamp. Its rocks are mainly igneous and metamorphic pre-Cambrian. Topographically it is a peneplain, upraised, somewhat eroded, then glaciated. This is an important part of the great area of northern pine forest. Much is now cut-over land, only a minor part being valuable for agriculture. It contains the chief copper mines of eastern United States and the greatest iron mines of the world.

South-western Wisconsin and small parts of adjacent States were missed by the several ice invasions though surrounded by a glaciated surface that extends 250 mi. farther south. Probably at no one time did the ice close around it. The margin of the ice sheet

was divided into lobes following the great valleys. In the different ice epochs they came from different directions, at one time from the north-west, at another from the north-east, the areas covered by these different advances overlapping south of this Driftless Area. The southern and western parts of this area are limestone uplands rather deeply and at places sharply carved by erosion. The northern part is mainly a lowland underlain by friable Cambrian sandstone covered by glacial outwash. With due allowance for the effects of different kinds of rocks on topography, this driftless area may be regarded as a sample of the topography that was elsewhere overridden by the ice. It is not very different from that which is seen beyond the limit of glaciation in eastern Ohio or western Kentucky or central Missouri.

Most of Illinois, Indiana and western Ohio have a drift cover remarkable for its small relief and distinguished by a total absence of lakes. The flatness is not absolute, for the retreating ice front halted at various stages, building recessional moraines, a few of which have the distinctive topography of moraines, while others are barely visible, being made apparent only by their effect on drainage. The major streams have cut down moderately into this surface and tributaries are developing, but not much headway has been made except near the Ohio and the Mississippi. A margin near these streams belongs to an older drift sheet (Illinoian) while most of the section was again covered by ice in the last (Wisconsin) glacial epoch. West of this section in Iowa and northern Missouri and parts of eastern Nebraska and Kansas, are the Dissected Till Plains, distinguished from the Till Plains east of the Mississippi by greater erosion. This difference results from the fact that the glacial mantle west of the Mississippi was spread in the Kansan glacial epoch and is the oldest glacial drift widely exposed in the country. Complete drainage is re-established; valleys now occupy fully four-fifths of the area. In the type of agriculture that distinguishes the central lowland (grains and domestic animals) the Till Plains and Dissected Till Plains are pre-eminent.

South of the latitude of Kansas City (39°) the central lowland (Osage section) was not glaciated. It extends almost to central Texas in a belt nearly 200 mi. wide. The underlying rocks dip gently west beneath the Great Plains syncline and away from the Interior Highland. As the surface slopes in the opposite direction the formations outcrop in parallel strips trending nearly north and south. The stronger beds form cuestas with east-facing escarpments, some of them so eroded as to make hilly belts a few miles wide.

Interior Highland.—Surrounded by the lowlands of south-central United States is the Interior Highland. Its northern and larger part consists of the Ozark plateaux on nearly horizontal though slightly domed rocks. The rocks of its southern third are folded along east-west axes. Altitudes in the Ozark plateaux are generally less than 1,600 ft., being highest near the centre, but in northern Arkansas on the southern slope of the dome the strong sandstone beds of the upper Carboniferous are preserved in a plateau that is locally more than 2,000 ft. high and ruggedly eroded, making the Boston mountains. In south-eastern Missouri in the midst of the plateau stand the St. Francois mountains, composed of granite, rising no higher than the surrounding horizontal sediments which once covered all. These ancient granite mountains were buried by marine sediments and are now being exhumed. They are among the best examples of their class. The Ozark province is one of the leading sources of lead and zinc.

The belt of folded structure in Arkansas and Oklahoma, the Ouachita mountains (15*b*) is essentially like the Appalachian Ridge-and-Valley province, the product of two cycles of erosion, with ridges on the stronger outcrops and intervening lowlands on the weaker rocks. The rocks of the Arkansas Valley (15*a*) are but mildly folded and although the stronger sandstones make either flat or sloping uplands the whole strip is less uplifted than its neighbours. This province has large supplies of coal. The Ouachita mountains have the famous Hot Springs of Arkansas and produce the novaculite (natural honestone) of the United States. In and near it also are important bauxite deposits.

Great Plains Province.—The vast area known as Great Plains is a north-south belt averaging about 400 mi. in width between the mountains of western United States and the lowlands of its centre. Its height at the base of the mountains is 5,000 to 6,000 ft. and at its eastern edge 1,500 to 2,000 feet. An eastward slope of 10 ft. to the mile is common. A part of this great area is literally plain, most of the northern third is peneplain and considerable areas on the borders, both in the east and west, are dissected into hills. All of it is semi-arid and the only trees are in river bottoms or on certain isolated mountains like the Black Hills. Most of it has good soil without the necessary water to take full advantage of the fertility. Perhaps a tenth part may be irrigated.

The flat portions of the province are best illustrated in the Llano Estacado (Staked Plains) of Texas and eastern New Mexico (13*d* on the accompanying map and table). Interrupted by the valleys of transverse streams these flats extend north to southern Nebraska and, in modified form, to the South Dakota boundary forming a belt known as the High Plains. These are remnants of a vast alluvial slope made by coalescing alluvial fans from the mountains. When the streams ceased their depositing habit and began again to erode, the eastern edge of the fluviatile deposit was first to suffer. In Texas the edge is retreating westward as a well defined escarpment, there being but a few miles between the flat upland and the lowland on the east. In Kansas and adjacent States the wasting edge of the former upland plain is represented by a broad belt of hills (13*e*). In Nebraska, a thick mantle of loess obscures the transition from high plains to central lowland. Between the belt of preserved high plains and the mountains, erosion was also more favoured, partly by original slopes, partly by the nature of the vegetation. Here (13*f-g-h*) the fluviatile mantle, where formed, was destroyed and the present landscape is one of varied relief. The South Platte, Arkansas and Pecos have broad terraced and well-farmed valleys, but north-eastern New Mexico and the adjacent part of Colorado is a region of plateaux, trenched by angular valleys and surmounted by various features of volcanic origin. The Edwards plateau at the southern extremity of the province (13*i*) is a limestone tableland almost as flat as the Llano Estacado but without the fluviatile mantle. It is cut off on the south and east sides by the great Balcones fault which for 300 mi. forms the inner boundary of the coastal plain. Streams are dissecting the plateau at the edges and have in part removed the same limestone from a large area just north of the Edwards plateau. This hilly section in central Texas (13*k*) is in a stage of the erosion cycle intermediate between the youth of the well preserved plateaux and the old age of the lowlands on the north.

North of latitude 43° the Great Plains province is in large part upraised peneplain, though perhaps not all of the same cycle. Second in areal importance are the extensive gravel plains, some of them perhaps being remnants of a sheet similar in origin to that which covers the high plains. Others are simple stream terraces of Pleistocene age. Some of the streams, especially near the mountains, have valleys hundreds of feet deep and their tributaries have deeply dissected the upland. Isolated mountains are dome-like uplifts, the largest of which is the Black Hills, almost 100 mi. long and 50 mi. wide, crossing the Dakota-Wyoming border. The structural uplift approximates 10,000 ft. but erosion has truncated the dome leaving the actual height less than 4,000 ft. above the plain on the east. The core of granite has thus been exposed at the top, while the strata outcrop in concentric ellipses, the stronger ones making ridges.

The northern part of the Great Plains province and a margin on the east (13*a*) was covered by the Pleistocene ice-cap leaving a strongly morainic topography in the Dakotas. The present course of Missouri river results from the obstruction of former drainage north-eastward to Hudson bay. The ponded waters overflowing from basin to basin found the present south-eastward course. Its relative youth is shown by the small width of its valley (1 to 3 mi. between bluffs) as compared with that of the Yellowstone and other tributaries.

Rocky Mountains.—As shown on the map (p. 720) the Rocky Mountain system is divided into four parts. The Southern Rocky Mountain province is a group of linear uplifts initiated

by east-west compression. The original folds were in large part levelled by erosion which thereby exposed the underlying granite, now revealed in north-south belts with a maximum width of 40 miles. Later uplift raised the general level to mountain heights but without sharp deformation. The old erosion surface was warped rather than folded, producing intermont basins. This later uplift enabled erosion to carve valleys in the granite and reduce the weaker rocks to lowlands. Commonly the granite belts are bordered by upturned sedimentary rocks, the several formations being of unlike strength, thus developing monoclinal foothills and valleys. Some large areas of granite 8,000 to 10,000 ft. high are plateau-like with a relief of only several hundred feet. These plainly represent a former lowland made by approximately peneplaning the first mountains. The largest of these tracts is South Park, 9,000 to 10,000 ft. high, west of Pikes peak. The same surface farther east and at many other places is carved into mountains whose summits approximate the same level. Looking across these crests, or over the undissected upland, Pikes peak is seen to rise as an isolated eminence 5,000 ft. above the level. It was a monadnock on the South Park peneplain. North of the Park and extending almost to Wyoming is the main crest of the Front range with many peaks 12,000 to 14,000 ft. high. Along this entire line residual mountains rise clearly above a dissected plateau. Only a minor part of what is called "mountains" in the southern Rockies consists of these residual eminences. The greater part are carved from the uplifted peneplain. In the entire system, both north and south, most of the residual mountains have "alpine" features due to former glaciers. These are cirques and U-shaped troughs, often separated by steep and narrow crags. The San Juan mountains in south-western Colorado consist largely of volcanic rocks which once covered the area in sheets of relatively small relief. Later they were carved by water and ice into their present forms.

The Middle Rocky mountains, between the Wyoming basin and Yellowstone National park, consist of definite ranges in which structures and trends are clearly related. The axes radiate from Yellowstone park to the south, south-east and east. A long sickle-shaped arm whose eastern side is the Bighorn range almost surrounds the Bighorn basin. Of the group of ranges trending south, the Wasatch in northern Utah is outlined on the west by a great fault, the range on the upthrown side overlooking Great Salt lake on the downthrow. Meeting this range at right angles is the Uinta range which extends eastward forming the southern rim of the Wyoming basin.

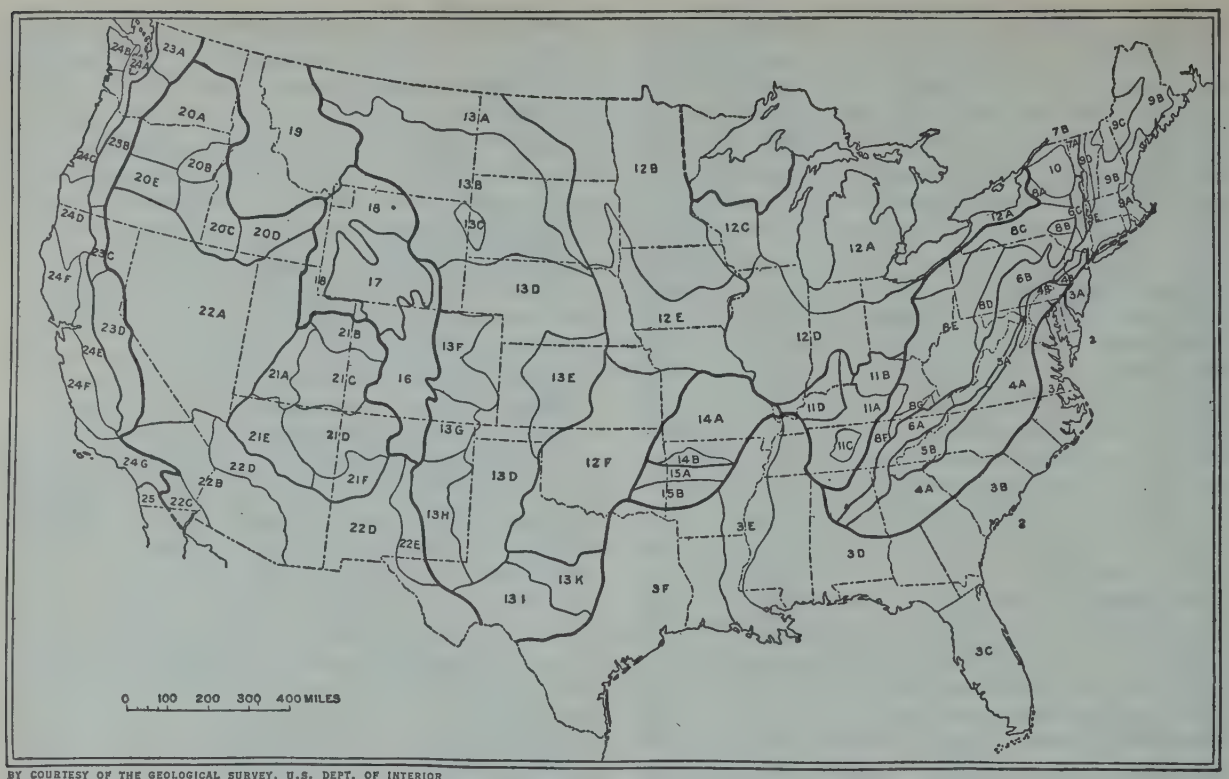
Yellowstone park is a plateau of rhyolitic lava with an average height of about 8,000 ft., enclosed by mountains on three sides but open to the west where a rapid descent leads down to the Snake river (basalt) plateau. A single narrow belt of mountains north and east of the plateau connects those to the north and those to the south. The lava fills a basin probably 2,000 ft. deep and appears to have conserved the heat revealed by geysers and hot springs. The hot springs are among the most extensive in the world and the geysers have no rival.

North and west of Yellowstone park the mountains (with few exceptions) are not in "ranges" in the usual sense of that word. Linear arrangement in agreement with structure is found to a limited extent, *e.g.*, in the Lewis range of Glacier National park, but in general the present relief does not suggest corrugation. Much the larger part of the area is a vast mountain upland divided only by stream valleys or by "Tertiary basins" in which the mountain surface has sagged. Generally the dominant ridges within a single view are of sub-equal height so that the horizon is not far from level. Altitudes between 6,000 and 9,000 ft. are prevalent. The Bitterroot mountains on the Montana-Idaho boundary are the upturned edge of a fault block tilted westward. Except for this deformation the surface is as described above. The history of the Northern Rocky mountains is much like that of those farther south. At similar altitudes glacial features are more pronounced. They are specially marked and picturesque in Glacier National park in the Front range near the Canadian boundary. The Selkirk and Bitterroot ranges are likewise noteworthy in this respect.

Wyoming Basin.—North of the southern Rocky mountain province is the Wyoming basin whose floor, almost 40,000 sq.mi. in extent, is a plateau 6,500 to 7,500 ft. high and largely free from mountains. Beneath its horizontal Tertiary rocks, and rising through them here and there, are the older folded sedimentaries and granite, showing that the Rocky mountain system is structurally continuous. Within and around this plateau the drainage is strikingly out of harmony with structure and topography. Green, Yampa, Bighorn, North Platte and Laramie rivers all leave the basin by canyons 1,000 to 3,000 ft. deep which might be avoided by going around the mountains. Green river, especially, was once a favourite illustration of antecedent river. This assumes that the river was in its place before the mountains rose across its course. It is now believed that these streams are superposed, *i.e.*, they chose their courses when the mountains were buried by weak Tertiary rocks (since eroded away) lying on top of those that now make the basin floor.

Colorado Plateau.—South and west of the Rocky mountains is a region of 125,000 sq.mi. whose underlying rocks are in the main horizontal and whose surface is tabular. In part it consists of wide-spreading plains at high altitude; elsewhere the plateau consists of tabular remnants between deep and branching canyons. In general the plateau abuts against the mountains on the north and east and ends in an escarpment overlooking lowlands on the west and south. The best known part of the province is the south-western section (*21e*) traversed by the Grand Canyon of the Colorado. This has a maximum depth of 6,000 ft. and a minimum width of less than 5 mi. from rim to rim. The conditions favouring canyons are all present in this province. Great altitude above base level, strong through-flowing streams and geologically recent uplift favour downcutting, while strong rocks and arid climate favour preservation of steepness. In this section the surface is on Permian limestone not deeply eroded. These rocks dip north under younger strata. At the same time the surface rises terrace-like over system after system until Eocene (Tertiary) beds and lava flows are found capping the high plateaux of Utah (*21a*) 9,000 to 11,000 ft. high, bounded, both east and west, by escarpments. Most of the strata underlying the high plateaux formerly extended southward over the plateau in which the Grand Canyon is cut. A mass of rock equal in thickness to the entire depth of the canyon was stripped from this plateau leaving a relatively low surface which was later uplifted. In other words, if the present canyon broadens and similar canyons develop and broaden until the entire plateau has been carried away to the depth of the present canyon bottom, then the streams of the present, newly inaugurated erosion cycle will have accomplished what was done once before. The same Eocene beds which appear in the high plateaux form a wide band on the northern margin, dipping northward until they turn up in the foothills of the Uinta range, and ending at the south in an escarpment. The general surface slopes agree with the structure. This is the Uinta basin (*21b*). South of it, and east of the high plateaux is the area of arid Canyon Lands (*21c*) deeply trenched by Colorado river and its tributaries, though its eastern margin in Colorado contains some broad fertile valleys. Farther south is the Navajo section (*21d*), like the Canyon lands but more arid and less canyoned because there are no mountains on the border to supply through-flowing streams. The Datil section (*21f*) on the south-east is largely lava-covered as is a very considerable area farther west (San Francisco mountain and vicinity) in the Grand Canyon section. Here also is the Zuni uplift, a dome like the Black hills.

Basin-and-range Province.—West and south of the Colorado plateau is a region marked by numerous small, roughly parallel mountain ranges separated by nearly flat detrital plains generally 4,000 to 5,000 ft. above the sea, but declining in altitude toward the Gulf of California. The northern half has long been known as the Great Basin and is the largest area of internal drainage in North America. The 100 or more mountain ranges divide it into an almost equal number of undrained basins. The hydrographic centres of some of these are marked by salt lakes; some others have playas, mud flats covered occasionally by a few inches of



BY COURTESY OF THE GEOLOGICAL SURVEY, U.S. DEPT. OF INTERIOR

MAP SHOWING PHYSIOGRAPHIC DIVISIONS OF THE UNITED STATES (SEE TABLE P. 721)

water. All are filled or veneered by detritus eroded from the mountains and deposited as alluvial fans. Such surfaces are nearly level and tend to rise until the basin is full. A few basins along the course of Humboldt river have been so aggraded with detritus as to establish through drainage which may reach Carson Sink or stop at Humboldt lake, according to season and weather. Many of the mountain ranges are 50 to 75 mi. long and 3,000 to 5,000 ft. above the basins and trend approximately north–south. Trees appear only in exceptional spots. Some of the ranges are known to be upraised or up-tilted fault blocks. As there is a strong family resemblance among ranges, it is considered probable that faulting is at least the master process in the making of these ranges. The internal structures are complex showing that the rocks were strongly folded and (in the best known cases) peneplaned and lava-covered before faulting made the present mountains. In northern Nevada and southern Oregon the mountains were uplifted so recently that their origin by faulting is beyond doubt. Farther south some ranges are so old and eroded that their origin is not obvious. Some of the ranges bear evidence that the master faults were made before the peneplain, the present mountains consisting of the more resistant fault-blocks exhumed by selective erosion. Both of these types of mountains are present but the relative number of each, or even which is more numerous, is not yet known.

South of latitude 35° 30′, and extending from California to New Mexico, many of the intermontane basins are connected by through drainage or at least by continuous slopes on which water might flow to the sea if the rainfall were sufficient.

Columbia Plateau.—The surface of the Columbia plateau between the Northern Rocky mountains and the Cascades is made by flows of dark lava. These flows submerged an uneven surface of erosion, locally almost mountainous as may be seen in vertical section in the mile-deep canyon of Snake river between Idaho and Oregon. The Snake river basin east of the 115th meridian represents the simplest and most youthful phase of lava plains. Here the flat surface, 4,000 to 5,000 ft. high, remains as it was when the lava cooled, without erosion and only beginning to weather and to form soil. It is trenched only by the canyon of Snake river whose depth increases westward to 700 feet. Farther west, in south-western Idaho and south-eastern Oregon, there is more erosion. Near the State boundary the terraced valleys afford valuable irrigable land. The plateau in eastern Washington declines from nearly 3,000 ft. on the east to less than 500 ft. where Columbia river breaks through the Cascades. This northern section (*20a*) consists of older lavas, subjected to long erosion and having a rolling surface covered (at least in the east) with wind-blown soil. Here are the famous wheat fields of eastern Washington and western Idaho, cultivated by methods of "dry farming" by which a crop is raised in alternate years. In eastern Oregon near the middle of the province a group of mountains stood as an island in the floods of lava. Around these a later bulging raised the plateau surface to 7,000 ft., exposing it to greater erosion. This is the Blue Mountain section (*20b*). The rise lay across the course of Snake river which succeeded in cutting down as fast as the land rose, making a canyon 5,000 ft. deep.

Sierra-Cascade Mountains.—From Canada to southern California a continuous barrier of mountains separates the Pacific border from the Intermontane plateaux. The Sierra Nevada south of the 40th parallel presents to the Great Basin one of the highest and steepest mountain fronts on the continent. It is the escarpment of a great fault, or compound fault, west of which an old mountain range, worn down almost to a lowland, rose again with a westward tilt. Streams descending its long western slope have greatly increased its ruggedness by cutting gorges. These were later occupied by glaciers which deepened the valleys and steepened their sides. Yosemite valley is only an extra fine example of the typical glacial trough with its uneven floor whose basins retained lakes until filled by gravel, and its over-steepened walls notched at the top by tributary valleys, the "hanging valleys" which end in falls. These mountains are mainly of granite but in the northern half is a belt of folded and metamorphosed sedimentaries making the "Gold Belt" which has yielded a large part of California's output of gold.

Table Showing the Physiographic Divisions of the United States

Divisions	*Characteristics*
Laurentian Upland	
1. Superior Upland	1. Submaturely dissected, recently glaciated peneplain on crystalline rocks of complex structure.
Atlantic Plain	
2. Continental Shelf	2. Sloping submarine plain of sedimentation.
3. Coastal Plain	
a. Embayed section	3a. Submaturely dissected and partially submerged, terraced coastal plain.
b. Sea Island section	3b. Young to mature terraced coastal plain with submerged border.
c. Floridian section	3c. Young marine plain: sandhills, swamps, sinks and lakes.
d. East Gulf Coastal Plain	3d. Young to old belted coastal plain.
e. Mississippi Alluvial Plain	3e. Flood plain and delta.
f. West Gulf Coastal Plain	3f. Young, grading inland to mature coastal plain.
Appalachian Highlands	
4. Piedmont Province	
a. Piedmont Upland	4a. Submaturely dissected peneplain on disordered resistant rocks; moderate relief.
b. Piedmont Lowlands	4b. Less uplifted peneplain on weak strata; residual ridges on igneous rocks.
5. Blue Ridge Province	
a. Northern section	5a. Maturely dissected mountains of crystalline rocks; accordant altitudes.
b. Southern section	5b. Mature to subdued mountains of disordered crystalline rocks.
6. Ridge-and-Valley Province	
a. Tennessee section	6a. Second-cycle mountains of folded strong and weak strata; valley belts predominating over even-crested ridges.
b. Middle section	6b. The same, but even-crested ridges predominate over valleys except on east side.
c. Hudson Valley	6c. Glaciated peneplain on weak folded strata.
7. St. Lawrence Valley.	
a. Champlain section	7a. Rolling lowland, glaciated; in part covered by young marine plain.
b. Northern section	7b. Young marine plain with local rock hills.
8. Appalachian Plateaux	
a. Mohawk section	8a. Maturely dissected, glaciated plateau; varied relief.
b. Catskill section	8b. Maturely dissected plateau of mountainous relief and coarse texture (glaciated).
c. Glaciated Allegheny Plateau	8c. Mature glaciated plateau of moderate relief.
d. Allegheny Mountain section	8d. Mature plateau of strong relief; some mountains due to erosion of open folds.
e. Unglaciated Allegheny Plateau	8e. Mature plateau of fine texture; moderate to strong relief.
f. Cumberland plateau section	8f. Submaturely dissected plateau of moderate to strong relief.
g. Cumberland Mountain section	8g. Higher mature plateaux and mountain ridges on eroded open folds.
9. New England Province	
a. Seaboard Lowland	9a. Peneplains below 500 feet, past-maturely eroded and glaciated; few monadnocks.
b. New England Upland	9b. Dissected and glaciated peneplains on complex structures; monadnocks.
c. White Mountain section	9c. Subdued and glaciated mountain masses of crystalline rock.
d. Green Mountain section	9d. Linear ranges of subdued and glaciated mountains and residual plateaux.
e. Taconic section	9e. Maturely dissected and glaciated mountains and peneplain on resistant folded strata.
10. Adirondack Province	10. Subdued mountains and dissected peneplain glaciated.
Interior Plains	
11. Interior Low Plateaux	
a. Highland Rim section	11a. Young to mature plateau of moderate relief.
b. Lexington Plain	11b. Peneplain on weak rocks; trenched by main rivers and locally dissected.
c. Nashville Basin	11c. Peneplain on weak rocks; slightly uplifted, moderately dissected.
d. Shawnee section	11d. Low, maturely dissected plateau with silt-filled valleys.
12. Central Lowland	
a. Great lake section	12a. Maturely dissected and glaciated cuestas and lowlands; moraines, lakes, and lacustrine plains.
b. Western Young Drift section	12b. Young glaciated plain; moraines, lakes, and lacustrine plains.
c. Wisconsin Driftless section	12c. Maturely dissected plateau and lowland invaded by glacial outwash. (Margin of old eroded drift included.)
d. Till Plains	12d. Young till plains; morainic topography rare; no lakes.
e. Dissected Till Plains	12e. Submaturely to maturely eroded till plains.
f. Osage Plains	12f. Old scarped plains beveling faintly inclined strata; main streams entrenched.
13. Great Plains Province	
a. Missouri Plateau, glaciated	13a. Glaciated old plateaus; isolated mountains.
b. Missouri Plateau, unglaciated	13b. Old plateau; terrace lands; local badlands; isolated mountains.
c. Black Hills	13c. Maturely dissected domed mountains.
d. High Plains	13d. Broad inter-valley remnants of smooth fluviatile plains.
e. Plains Border	13e. Submaturely to maturely dissected plateau.
f. Colorado Piedmont	13f. Late mature to old elevated plain.
g. Raton section	13g. Trenched peneplain surmounted by dissected, lava-capped plateaux and buttes.
h. Pecos Valley	13h. Late mature to old plain.
i. Edwards Plateau	13i. Young plateau with mature margin of moderate to strong relief.
k. Central Texas section	13k. Plateau in maturity and later stages of erosion.

Table Showing the Physiographic Divisions of the United States—continued

Divisions	*Characteristics*
Interior Highlands	
14. Ozark Plateaux	
a. Springfield-Salem plateaux	14a. Submature to mature plateaux.
b. Boston "Mountains"	14b. Submature to mature plateau of strong relief.
15. Ouachita Province	
a. Arkansas Valley	15a. Gently folded strong and weak strata; peneplain with residual ridges.
b. Ouachita Mountains	15b. Second-cycle mountains of folded strong and weak strata.
Rocky Mountain System	
16. Southern Rocky Mountains	16. Complex mountains of various types; intermont basins.
17. Wyoming Basin	17. Elevated plains in various stages of erosion; isolated low mountains.
18. Middle Rocky Mountains	18. Complex mountains, mainly anticlinal ranges; intermont basins.
19. Northern Rocky Mountains	19. Deeply dissected mountain uplands, not anticlinal ranges; intermont basins.
Intermontane Plateaux	
20. Columbia Plateaux	
a. Walla Walla Plateau	20a. Rolling plateau with young incised valleys.
b. Blue Mountain section	20b. Complex mountains and dissected volcanic plateaux.
c. Payette section	20c. Young plateaus of prevailingly weak rocks; broad alluvial terraces. (Applies to northern part only.)
d. Snake River Plain	20d. Young lava plateau.
e. Harney section	20e. Young lava plateau; features of recent vulcanism; internal drainage.
21. Colorado Plateaux	
a. High Plateaus of Utah	21a. High block plateaux, in part lava-capped; include terraced plateaux on south side.
b. Uinta Basin	21b. Dissected plateau; strong relief.
c. Canyon Lands	21c. Young to mature canyoned plateaux; high relief.
d. Navajo section	21d. Young plateaux; smaller relief than 21c. into which it grades.
e. Grand Canyon section	21e. High block plateaux, trenched by Grand Canyon.
f. Datil section	21f. Lava flows entire or in remnants; volcanic necks.
22. Basin-and-Range Province	
a. Great Basin	22a. Isolated ranges (largely dissected fault blocks) separated by aggraded desert plains.
b. Sonoran Desert	22b. Widely separated short ranges in desert plains.
c. Salton Trough	22c. Desert alluvial slopes and delta plain; Gulf of California.
d. Mexican Highland	22d. Isolated ranges (largely dissected block mountains) separated by desert plains.
e. Sacramento section	22e. Mature block mountains of gentle dip; block plateaux; bolsons.
Pacific Mountain System	
23. Sierra-Cascade Mountains	
a. Northern Cascade Mountains	23a. Sharp alpine summits of accordant height; higher volcanic cones.
b. Middle Cascade Mountains	23b. Generally accordant summits; higher volcanic cones.
c. Southern Cascade Mountains	23c. Volcanic mountains variously eroded; no very distinct range.
d. Sierra Nevada	23d. Block mountain range tilted westward; accordant crests; alpine peaks near east side.
24. Pacific Border Province	
a. Puget Trough	24a. Lowlands of diverse character; in part submerged.
b. Olympic Mountains	24b. Generally accordant crests; local alpine peaks.
c. Oregon Coast Range	24c. Uplifted peneplain on weak rocks, dissected; monadnocks of igneous rock.
d. Klamath Mountains	24d. Uplifted and dissected peneplain on strong rocks; extensive monadnock ranges.
e. California Trough	24e. Low fluviatile plains.
f. California Coast Ranges	24f. Parallel ranges and valleys; on folded, faulted and metamorphosed strata; rounded crests of subequal height.
g. Los Angeles Ranges	24g. Uplifted fault blocks; alluviated lowlands.
25. Lower Californian Province	25. Dissected west-sloping granite upland (in northern part).

North of Feather river the range changes completely. There is no evidence of uplift, only a piling up of volcanic materials from hundreds of vents. Lava flows, ash beds and cinder cones are of all ages from those that are fresh and shapely to others almost eroded away. Mt. Shasta with its beautiful cone (14,161 ft.), and Lassen's peak, the only volcano in the country witnessed in action, belong to this southern section of the Cascades (*23c*). A little north of the Oregon boundary there is evidence that crustal uplift is added to volcanic accumulation. Farther north the range owes its height more and more to uplift and less and less to the piling up of ejecta. The volcanic cover gives out entirely in central Washington, north of which the Northern Cascade mountains (*23a*) consist of metamorphosed Paleozoic rocks and granite, intricately dissected into sharp peaks and ridges most of which, in a single view, rise to an almost uniform height. The level thus determined varies from 6,000 to 8,500 ft., being gently arched. Above this nearly level horizon in both Oregon and Washington rise the isolated cones of extinct volcanoes 3,000 to 7,000 ft. higher. The best known are Mt. Rainier (14,408 ft.) in Washington and Mt. Hood (11,245 ft.) in Oregon. Crater lake in southern Oregon is the finest example of its class in America. It originated by the engulfment of the upper part of a volcano thus truncating the cone and leaving a pit 5 to 6 mi. in diameter at the water-level, which is here 6,117 ft. high. Above it the walls of the caldera rise 500 to 2,200 ft. and below it the basin is 2,000 ft. deep.

Pacific Border.—The Pacific Border embraces a chain of coast ranges with long and important valleys between these and the Sierra-Cascade mountains. The most northerly range is the Olympic mountains (*24b*), not unlike the Northern Cascades but lower. The Oregon Coast range (*24c*) is a gentle anticline of Tertiary beds, relatively recent in origin. It is succeeded on the south by the Klamath mountains, (*24d*), a range of long standing, consisting largely of metamorphosed Palaeozoic rocks, once eroded down to a peneplain but uplifted again, locally as high as 7,000 ft., then deeply and ruggedly eroded. Most of the California coast is occupied by the California coast ranges (*24f*). These are relatively low mountains (generally between 2,000 and 4,000 ft.)

ranged in parallel ridges due largely to faulting of an earlier, much deformed and much worn down mountain belt. Some broad valleys south of San Francisco are filled with late Tertiary sediments because of depression at that time. Still later the coast seems to have been depressed some 1,500 ft. below its present level. Shorelines etched against the mountain side are preserved here and there at various levels between the sea and the 1,500 ft. contour. As shown by these old shorelines, the depression that caused San Francisco bay is relatively recent.

Puget sound is the submerged northern end of a trough (*24a*) 350 mi. long between the Cascades and the Coast range. Its southern end is the valley of the Willamette, a southern tributary of the Columbia. Some of the valleys in this long trough are agriculturally rich. Commercially the region of the sound is favoured by its fine harbours and the four or more transcontinental railroads which these harbours have attracted. The Great Valley of California (*24e*) between the Coast range and the Sierra Nevada is 400 mi. long and 50 mi. wide. In the upwarp of the adjacent mountain belts, this belt was bent down. As a consequence it was covered with the silt, sand and gravel washed from the mountain slopes. That deposition is still going on in the valley is evident from the habits of the two master streams, the Sacramento from the north and the San Joaquin from the south. These have small gradients and run between high natural levees; sandbars are abundant; at the head of San Francisco bay the two streams unite to build an extensive delta. The filling of the valley is mainly from the higher mountains on the east. Deposition is in the form of alluvial fans which in the southern part have crowded the San Joaquin westward to the foot of the Coast range; the great alluvial fan of Kings river, extending across the valley, has cut off its southern third forming Tulare basin, partly occupied at times by a playa lake. Here the climate is so arid that all inflow is evaporated and there is no drainage to the San Joaquin. Irrigation is highly developed, especially in the more arid southern half on the great alluvial fans. Fruits, nuts and raisins are the chief products.

The Sierra Nevada and the Great Valley extend south to latitude 35° beyond which there are ranges trending nearly east-west from the Mojave desert to the Pacific. The famous fruit-growing lowlands of California lie mainly farther south. The Gulf of California occupies a down-warped trough similar to the Great Valley. In recent geologic time the gulf reached 150 mi. farther north. This extension was cut off by the delta of the Colorado river and its waters evaporated. It is now the basin of the Salton Sink, still in part below sea level and known, where irrigated, as the rich Imperial Valley.

II. GEOLOGY

The surface of North America, like that of all continents, stands two to three miles above adjacent ocean floors and apparently has so stood during the 2,000,000,000 years of its recorded history. Variations from time to time in ocean basin capacity, in oceanic volume and in relief of the continent's surface have, however, produced great variations in the amount of continental surface emerging as land above ocean levels. Shallow seas comparable to Hudson bay (average depth 200 ft.) have repeatedly spread over large fractions of the North American continental platform, leaving their record in limestone, shale and sandstone sediments with entombed remains of the marine life of the time. Repeatedly, also, these shallow marine floodings have been withdrawn and the destructive processes of weathering and erosion from exposure to the atmosphere have attacked the land areas, destroying part of the earlier sedimentary record. Thus marine deposits made during the next time of flooding have come to lie unconformably on the eroded surfaces of older deposits, the unconformity being essentially the land surface at the close of the intervening time of emergence. Elsewhere, large areas remained above sea level and experienced only erosion while the marine transgressions were occurring.

None of the marine submergences duplicated any other, yet the deciphered history shows that the continent possessed certain recurring lineaments, the invading seas early taking possession of linear tracts (geosynclines), subparallel to the eastern, western and southern continental margins and lingering there when marine withdrawals were occurring. Other negative areas (epicontinental, epeiric shelf) were more briefly inundated and certain tracts (shields, geanticlines, positive areas, kratons) repeatedly, although not invariably, escaped even the maximum floodings.

These alternating experiences of the continental surface, largely constructional when beneath epicontinental or geosynclinal seas and largely destructional when exposed to the atmosphere, constitute the framework of its geological history. The correlation of successive similar events in widely separated regions is possible because of the concomitant progressive evolutionary changes which the embedded fossils, chiefly marine invertebrates, in the sedimentary rocks record.

Based on the stratified sediments and their fossils, on the interrupting unconformities and on evidence for successive times of mountain making (orogeny) and igneous activity, most geologists have adopted a classification of four great eras of earth history, subdivided into about 15 periods. The terms for these divisions of earth history used herein are those commonly accepted in the United States and Canada.

The Pre-Cambrian Era.—This slightly awkward term springs from two facts. One is that Cambrian sedimentary rocks, the oldest in the record of the succeeding Palaeozoic era, are also the oldest rocks with a good record of abundant and varied organisms. Pre-Cambrian rocks have only very rare showings of organic structures. The other fact is that these pre-Cambrian rocks have been so tremendously disordered and metamorphosed by orogenic movements and so extensively intruded by igneous invasions from below that the number of years actually involved in making them is unknown. In most geological literature two such eras are specified, Archaeozoic and Proterozoic, but the distinctions of dominantly igneous origin of the Archaeozoic rocks and dominantly sedimentary origin for the Proterozoic rocks has proved in later studies to be inapplicable and the terms are being abandoned.

Theoretically the rocks made during this earliest era of earth history underlie all younger rocks. Large areas also exist where there is no cover of later deposits, either because one was never made or because erosion destroyed any cover once existing. In the United States all exposed Pre-Cambrian rocks belong to the second group and owe their present position to the occurrence of orogenic deformations in later geological time and the inescapable consequence of such uplifts: destructive erosion. Indeed, the largest of these areas, in northern Minnesota, Wisconsin and Michigan, has virtually lost the mountains themselves, only a few residual hills surviving the reduction of former massive ranges to a peneplained area of low relief. Traced northward into Canada, this tract about the west end of Lake Superior broadens into a great expanse of uncovered Pre-Cambrian rocks, occupying almost all of the provinces of Quebec and Labrador, and most of Manitoba, Ontario, the Northwest Territories and Baffin Island. This, the Canadian shield, is North America's greatest positive area. Some of it may never have been submerged in any later time; most of it has certainly had but slight and geologically short-lived sedimentary cover.

The Piedmont plateau and Great Smoky mountains, lying west of the Atlantic coastal plain, are portions of a smaller positive area (Appalachia) composed largely of Pre-Cambrian rocks. The Adirondack mountains of New York, the Green mountains of Vermont and the White mountains of New Hampshire are, despite their magnitude as topographic eminences, only the Pre-Cambrian core rock of former ranges whose folded and faulted structures indicate the way such cores have been forced locally higher than the surrounding "basement" rocks still covered by perhaps a mile of later formations. Small and isolated outcrops of Pre-Cambrian rocks in the central lowlands and Great Plains are the St. Francis mountains of Missouri, the central part of the Black hills of South Dakota, tracts in southwestern Minnesota and adjacent South Dakota, the Wichita and Arbuckle mountains

of Oklahoma and the Llano uplift of central Texas. In the Rocky mountain system many ranges possess exposed Pre-Cambrian core rock, the uplift and erosional uncovering of which is in general of later date than in the eastern occurrences noted. Some basin range mountains, particularly in Arizona and adjacent California, are similar in this respect. The mile-deep Grand canyon of the Colorado was cut down into the Pre-Cambrian basement which here is under a thick plateau cover of flat-lying younger rocks.

Most of these ancient rocks have suffered great metamorphic alteration under repeated high compressions and temperatures during past orogenies. Prevailingly, the high-angle foliation of schists and slates, from growth of platy mineral crystals oriented at right angles to the lateral pressures, largely obliterated original stratification and possible organic records. Little success attended attempts at correlation of formations, orogenies and erosion cycles of widely separated regions. Even unravelling the stratigraphic succession in any one region is difficult. The most nearly satisfactory classification is for the Canadian shield where four systems of sedimentary rocks and contemporaneous lava flows were deposited, each time of deposition being terminated by orogenic deformation and associated granitic intrusions, and each orogeny followed by erosion so long continued that the newly made mountains were virtually wiped off the face of the earth and a peneplain left truncating the profoundly altered roots of those vanished ranges. Unconformably on such peneplained surfaces were deposited the sediments of the next following submergence.

Later Pre-Cambrian rocks in the southern part of the Canadian shield record glaciation by an ice sheet nearly 1,000 mi. across. Elsewhere and at other times, aridity seems recorded. Whatever organisms existed, as they assuredly did, were marine aquatic forms, little affected by climates of the land areas. Seaweed vegetation that secreted calcium carbonate is on record. Animals allied to sponges, worms, corals and crustaceans existed but left very few fossil traces, chiefly because of lack of hard parts. Abundant disseminated graphite in some Pre-Cambrian metasedimentary rocks is accepted as derived from organic carbon.

The pre-eminence of the United States in manufacture of steel is in part the result of the enormous Pre-Cambrian iron ore deposits (altered ferruginous sediments) of the Lake Superior region. The great native copper-mining district of the Keweenaw peninsula, Mich., is developed in lavas and conglomerates of late Pre-Cambrian age, the metal having been deposited in cavities by thermal water rising from deep-seated magma bodies.

Pre-Cambrian time was tremendously long. Perhaps three-fourths of all recorded earth history occurred before the Cambrian seas with their abundant population of marine invertebrates transgressed the continents. Reckoned from the radioactive disintegration of uranium and thorium minerals of the oldest Pre-Cambrian igneous rock studied, their intrusion, cooling and crystallization occurred 2,300,000,000 years ago. And the Pre-Cambrian rock which received the intrusion was already in existence.

The Palaeozoic Era.—The pattern for North American positive and negative areas for Pre-Cambrian time is known only in fragments and traces. The Palaeozoic record, however, is sufficiently well-preserved that generalized maps of the land and water areas of the continent may be made, not only for each of the six periods but for different epochs during the advance, the maximum spread and the retreat of each marine flooding. Four persistently positive areas are known. The Canadian shield, nearly 2,000,000 sq.mi. in area, was the largest. It still exists with only Hudson bay submerging a relatively small part of it. Appalachia lay along the Atlantic seaboard, reaching from the Canadian maritime provinces southwestward to Georgia and Alabama, and extending an unknown distance eastward beyond the present continental margin. Llanoria lay to the south and largely subsided during later time into the depths of the present Gulf of Mexico. Cascadia, along the Pacific coast, similarly vanished.

Parallel and close to the inner margins of these positive areas lay three geosynclines or repeatedly subsiding troughs, the Appalachian geosyncline where now are the Appalachian mountains, the nearly east-west Ouachita geosyncline across Oklahoma, Texas and northern Mexico, and the Cordilleran geosyncline reaching from the Gulf of California northward across Nevada, Utah, Idaho and British Columbia. The thick and relatively coarse detrital sediments deposited in them (now exposed in eroded mountain structures) are in contrast with the much thinner, finer-textured and largely calcareous deposits made contemporaneously in the broad shallow epeiric seas of the continental interior. Obviously, the thick trough fillings of shallow water deposits record repeated subsidences in the geosynclines as aggradation continued. The coarseness indicates derivation from closely adjacent positive areas. Repeated risings in those land areas, either as mountainous uplifts or broad warpings, are also required to account for the enormous thicknesses of land waste in the trough sediments. The Appalachian geosyncline received from 30,000 to 50,000 ft. of Palaeozoic deposits.

Cambrian Period.—During early Cambrian time, marine overlap on the continent was limited to the Appalachian and Cordilleran geosynclines. By the middle of the period, the sea had spread across the interior also and aquatic forms could pass from the Atlantic to the Pacific. At least 30% of the continent was then below sea level. The dominant limestone and dolomite formations of the middle Cambrian Age were derived largely from calcareous tests and shells of inconceivable numbers of middle Cambrian marine invertebrates. Late Cambrian time witnessed a gradual withdrawal of this epicontinental flooding but, for the first time, the Ouachita geosyncline appeared in the history.

This is a generalized statement of events, the like of which were occurring in other continents as well during the more than 70,000,000 years of Cambrian time. Minor fluctuations of the sea level and warpings of the continent make a more complicated history than can be outlined here. The period was brought to a close by an almost complete emergence of all continents, perhaps because of a deepening of the ocean basins. The newly exposed Cambrian deposits thereupon suffered some erosion before the return of the sea in the next submergence. Because no mountain folding occurred in North America during this emergent interval and therefore erosion could not bite deeply into the new land, most of the Cambrian sediments survived to become buried later beneath Ordovician and younger deposits.

Cambrian time is noteworthy for the spectacular appearance in the fossil record of almost all invertebrate phyla. Evolutionary changes that occurred during the Cambrian provide us with "index fossils," certain species which lived only during the early, middle or late Cambrian. There were even more extinctions of old and appearances of new forms during the interval following the withdrawal of Cambrian waters and preceding the advance of the Ordovician seas.

Ordovician Period.—The relatively shallow epicontinental seas, returning to inaugurate the Ordovician period, first entered the geosynclinal troughs, later spread from the arctic to the Gulf of Mexico in the greatest submergence the continent has ever had. The remaining land areas, scarcely half of North America's total area, were low-lying islands which determined the shifting outlines of embayments and supplied detritus, chiefly fine-grained, to their associated basins. Dominantly the basins received organically derived calcium carbonate, hence the large proportion of limestone and dolomite in the record.

Several low domes (Cincinnati-Nashville, Ozark, etc.) with intervening saucerlike basins (Michigan, Illinois) were prominent in the Ordovician palaeogeography. The domes (or arches) were repeatedly submerged and emerged, as numerous discontinuities in their stratigraphic sequences show, while the basins were undergoing more nearly continuous sedimentation.

The fossil record tells of different immigrations at different times into the shifting epeiric seaways from bordering oceans.

Crustal disturbances in northern Appalachia, chiefly during the late Ordovician, culminated in close folding, thrust faulting, mountainous uplifts and volcanic activity. Interbedding of lava flows and volcanic ash beds (bentonite) with Ordovician marine deposits are part of this record. So are the coarse nonmarine clastics in the nearby Appalachian geosyncline.

Insofar as the deposits tell of climate, there could not have

been a zonation like that of the present earth for some coral species ranged in latitude from the southern United States north into arctic Canada and even Greenland. Only wide and equably distributed mild temperatures of the epicontinental waters can account for this.

Ordovician rocks have yielded immense quantities of petroleum and natural gas, in Ohio for a decade or so before 1900 and in Oklahoma and adjacent Texas beginning about 1920. Most roofing slate quarried in the United States comes from metamorphosed Ordovician shales in the northern part of the Appalachian geosyncline. Most decorative marbles of domestic origin are secured from altered Ordovician limestones in the same great trough of sedimentation. The Illinois-Wisconsin-Iowa lead- and zinc-mining district is developed in mid-continent Ordovician sediments; the sulphide ores, however, postdating the host rock.

Duration of the Ordovician period appears to have nearly equalled that of the Cambrian.

Silurian Period.—The stratification of most Silurian rocks in the United States parallels that of the subjacent Ordovician formations. But the differences in fossil fauna below and above the contact indicate a considerable time of emergence (a hiatus or lost interval) when the Ordovician marine forms had been forced to retreat to already populated continental margins and were there crowded into intense competition for living room and food. Evolutionary changes in marine life during all such emergences were maximal, both in extinctions and in appearance of new forms.

The Silurian record, like the Cambrian and the Ordovician, tells of slow and irregular advance of the sea into the geosynclines and epicontinental areas, interrupted at least twice by emergences suggesting those greater ones which geologists use for delimiting periods. The early Silurian transgression entered the United States along the Appalachian geosyncline and spread westward across part of the central lowlands and into the Great Plains along the Ouachita trough. By middle Silurian time, the sea had spread over the Great Lakes region and northward to reach the arctic, actually lapping over on parts of that great positive area, the Canadian shield. In late Silurian time, restriction and dismemberment of the epicontinental seas left a relict "dead sea" in the Great Lakes region. In it, immense quantities of salt were deposited, along with much gypsum and associated marine sediments. This huge evaporation pan must have had a connection with the sea by which it became replenished at intervals with more salt water. By this time, also, the late Ordovician mountains above noted had been so reduced by erosion that the sea overlapped the disordered strata of their stumps and buried them beneath late Silurian sediments.

There is scarcely a more striking feature of any Palaeozoic period's history than that of the middle Silurian mid-continent archipelago of "coral" reefs. Dozens are known in outcrops and quarries of Niagaran (mid-Silurian) strata in Indiana, Illinois, Iowa, Wisconsin and Canada. Their wide range in latitude indicates the nonzonal character of the mid-Silurian climate, just as the late Silurian salt and gypsum record at least a local aridity.

In addition to the great salt reserves, early middle Silurian rocks along the Appalachian trough contain a sedimentary iron ore, basis of the Birmingham, Ala., iron-mining and steelmaking district.

The 30,000,000 years of Silurian time closed quietly in North America although in high northern latitudes of all continents, one of the great mountain-making events of earth history occurred. Vulcanism of late Silurian age occurred in Maine and adjacent Canada.

Devonian Period.—The marine withdrawal and continental emergence, conventionally chosen for subdividing geological time, was incomplete in parts of the Appalachian geosyncline for the Silurian-Devonian interval, sedimentation and a faunal record bridging the gap left elsewhere by the unconformity between the two systems. Indeed, only this trough of sedimentation seems to have gone below sea level during the entire early Devonian. By the middle of the period, overflow had submerged the Great Lakes region and a much more extensive flooding had advanced southward from the arctic, skirting the Canadian shield and reaching the upper Mississippi valley. It also connected with marine water in the Cordilleran geosyncline and so remained until the end of the period. The eastern and western seas were joined across the continental interior briefly but long enough for mingling of arctic and low latitude organisms.

By the middle of Devonian time, mountains were again growing in northern Appalachia, the early Devonian deposits deformed in their making but the late Devonian sediments unaffected. The tremendous quantities of coarse waste deposited in the adjacent Appalachian trough testify to the rapid growth of a lofty range.

In the evolution of living forms, the Devonian probably ranks next to the Cambrian in importance for at this time begins the record of life on land and in fresh water. The first known air-breathing vertebrates (Amphibia) and a great variety of primitive fishes appeared. The oldest known land plants, some with trunks 40 ft. long, are buried in middle Devonian nonmarine deposits of southeastern New York. Favouring climates appear to have prevailed, both on land and on the northern shallow seas.

Mississippian Period.—All the familiar seaways of the continent, excepting the northern part of the Appalachian geosyncline, were occupied during this period, the invasion following the familiar plan of an early possession of the great troughs and a later shallow spreading over the continental interior. The northern Appalachian geosyncline trapped great thicknesses of waste from renewed upbowing of the middle Devonian mountains but, like most of late Devonian sedimentation there, the subsiding trough was kept filled above sea level and the deposits were nonmarine. Erosion to the penultimate stage of peneplanation had preceded the Mississippian marine encroachments and the invading seas spread so widely over this lowland that their deposits lie in places on all older systems, even Pre-Cambrian. Apparently Appalachia and Llanoria were one continuous land mass, the sea with its fauna entering from the arctic, Pacific and western Gulf of Mexico. Hundreds of feet of limestones characterized the interior deposits; thousands of feet of more largely clastic rocks were laid down in the troughs adjacent to Llanoria and Appalachia. Either late in Mississippian time or early in the Pennsylvanian period, much crustal unrest occurred in these margining lands and the deformations were extended to sediments in the troughs. Other unrest occurred in the interior, Upper Mississippian formations in Illinois recording eight successive brief withdrawings and returnings of the sea.

Mississippian time, 30,000,000 years long, saw the beginnings of that very extensive swampiness which, for an equal length of time, characterized much of the continent during the following period. Commercial coal of Mississippian age occurs in Virginia. A later mineralization was responsible for the Missouri-Oklahoma-Kansas lead- and zinc-mining district in Mississippian rocks.

Pennsylvanian Period.—Except for mountainous Llanoria and Appalachia, the continent was a great flat lowland in opening Pennsylvanian time. The habitually subsiding geosynclines first went below sea level but only the western one received marine deposits. The other two were filled as rapidly as they sank with waste from their high borderlands. The Appalachian trough also received thick peaty accumulations made in immense swamps and now constituting the early Pennsylvanian coal beds of West Virginia and Alabama.

By the middle Pennsylvanian, swamps had spread over much of the interior as well, and the enormous coal reserves of half a dozen central lowland states were being initiated. Repeatedly sea water inundated and was withdrawn from these swamps, leaving interbedded marine deposits and minor unconformities. Farther west, Pennsylvanian sediments are chiefly marine.

Orogenic movements occurred in the United States, not only during initial Pennsylvanian stages but at different times and places throughout and at the close of the period. Southern Oklahoma saw a northward thrusting from Llanoria into the Ouachita trough. Southwestern Texas and western Colorado had comparable deformations. These seem to have been forerunners of the enormous lateral squeezings of parts of the continent during the following period. Pronounced orogenies of late Pennsylvanian and

of Permian time occurred in most continents.

The great coal deposits, also made in other continents, bespeak a warm, humid, equable Pennsylvanian climate for most of the globe. The character of the plants and associated amphibians, insects, spiders and fresh-water clams and snails tells the same story. So do the high-latitude Pennsylvanian corals.

Permian Period.—Despite the orogenies noted, Pennsylvanian time passed into Permian without marked breaks of sedimentation in the geosynclines. It was not for long, however. By middle Permian time, the Appalachian trough had been completely filled and before the Palaeozoic era had closed, that incredible thickness of sediments (maximum, 50,000 ft.) had been crushed into longitudinal folds and thrust sheets of a great mountain range. As a site of sedimentation, the geosyncline ceased to exist from that time on. Lingering seas in Texas and New Mexico left a great limestone reef (Carlsbad) with adjoining salt pan lagoons and associated highly oxidized red sands and muds. Obviously the humid Pennsylvanian climate had been altered here to one of marked aridity. A "dead sea" finally came to exist in this region.

The Appalachian orogeny, styled a "revolution," culminated at the close of the period. The 500 mi. of original width of the trough was squeezed into half of that. Restoration of the great folds indicates uplift of three or more miles. The Ouachita geosyncline was also crushed from the south and the dominant folded mountain structures of Arkansas and adjacent Oklahoma were made. Without undergoing such marked orogeny, the Cordilleran geosynclinal region experienced considerable volcanic activity.

The greatest salt deposits of the world are in the Permian system. Associated gypsum and dune sand indicate an aridity exceeding that of today. Not too surprisingly, another climatic consequence of the widespread emergence and uplift was glaciation on four continents, the vicinity of Boston, Mass., yielding a record for the United States.

As might be expected, great changes in the life of the earth resulted from these extreme geographic and climatic changes. The typical coal swamp plants were replaced by conifers and cycads. Reptiles took precedence over amphibians and among their varied forms was a group whose teeth, jaws and skulls foreshadowed the arrival of mammals in the Mesozoic era.

The Mesozoic Era.—The widespread mountain making, continental emergence, climatic rigours and biological changes of the Permian mark the close of the Palaeozoic era and the opening of succeeding Mesozoic time.

Triassic Period.—The waning importance of Appalachia and Llanoria as positive areas and the elimination of their persistently subsiding bordering geosynclines left only the Cordilleran trough for marine sedimentation on the continent during the Triassic. Interbedded with such marine deposits is much volcanic material. Eastward from this trough are interfingered nonmarine shales and sandstones, part of a great alluvial plain where now are the Rocky mountains, Colorado plateau and western Great Plains. In the eastern United States, much of Triassic time was consumed in erosion of the newly made Appalachian mountains. Late in the period, tensional faulting made a series of elongated basins from North Carolina to Nova Scotia which were filled with nonmarine deposits and intercalated lava flows as rapidly as they were deepened. At the close of the period, tilting and uplift gave this faulted region a mountainous aspect again.

During the Triassic appeared the great conifers of the Arizona petrified forest, nearly 200 ft. high. The small beginnings of the greatest land reptiles, the dinosaurs, date from this time. The sea also had its reptiles, the plesiosaurs and ichthyosaurs. True mammals, however, are not known from Triassic deposits.

Jurassic Period.—The marine Jurassic overlaps on United States territory were from the Pacific, arctic and Gulf, only the former enduring for the entire period. The arctic invasion reached as far south as Colorado and Utah late in Jurassic time; the Gulf invasion (reaching north to Arkansas) did not begin until late in the period. Vigorous vulcanism, some of it submarine, accompanied marine sedimentation in the west. The arctic embayment was long and narrow. During the next period it developed into a new geosyncline which, in the end, suffered the fate of all subsiding troughs with excessively thick sediments; it was crushed into a mountain system, the Rocky mountains. Much Jurassic nonmarine deposition also occurred in the western states, thick dune sand formations dovetailing with marine beds.

Orogeny which deformed and metamorphosed the thick western sediments at about the period's end was accompanied by enormous granitic intrusions, reminiscent of similar Pre-Cambrian events. The California "Mother lode" and the Nevada Comstock lode date from this igneous activity. It was modern stream waste from erosion of the Mother lode (placers) which gave California the gold rush of 1849.

Nonmarine Jurassic deposits have yielded skeletons of almost unbelievably huge dinosaurs. A new reptilian venture was the pterosaur, a flying saurian. The first birds appeared (no remains known in America at mid-20th century) and, most significant, the first mammals. Small but agile, they lived successfully with the enormous dinosaurs in Wyoming and vicinity.

Cretaceous Period.—The last great submergence of North America marks the last period of the Mesozoic era. The world over, Cretaceous seas probably submerged more continental surface than any previous flood had ever done. In a pulsatory fashion western Gulf water advanced northward to meet arctic water, forming a huge mediterranean sea by the middle of the period. Marginal overlap by Atlantic and Pacific water indicated the final disappearance of Appalachia and Llanoria as borderlands. The eastern Gulf reached north to the southern tip of Illinois.

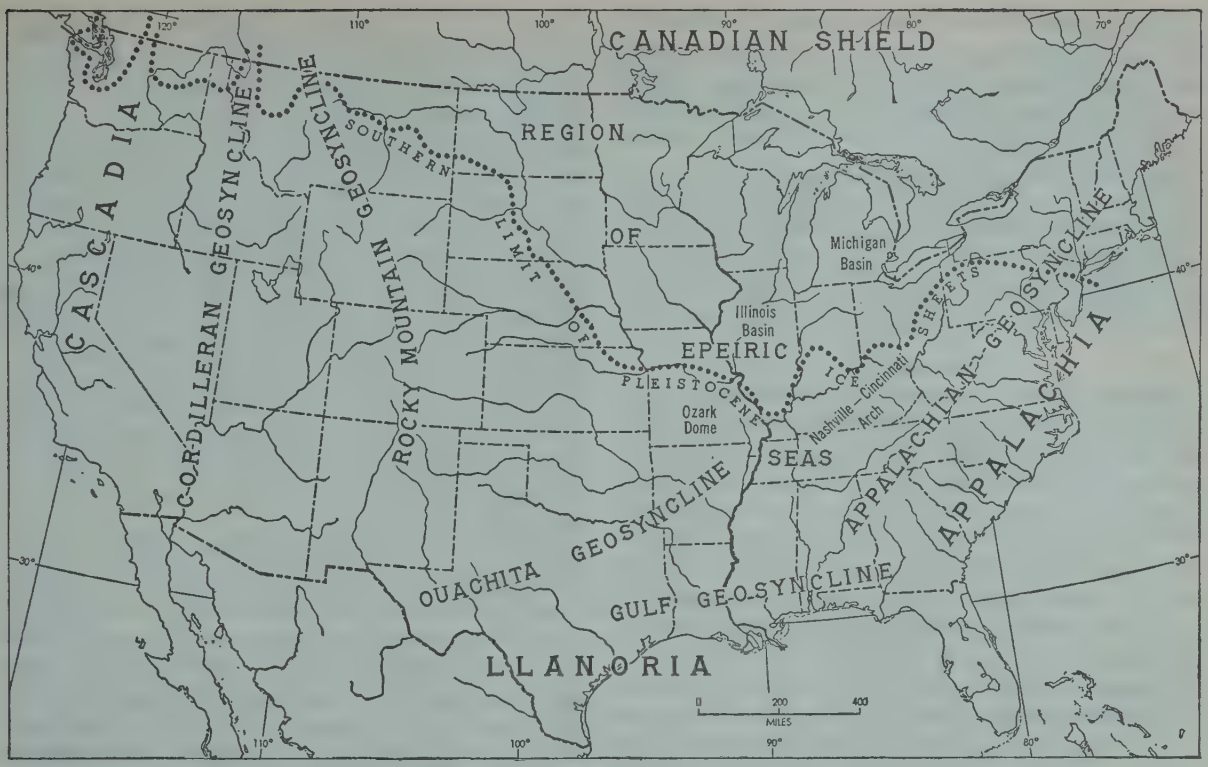
This North American mediterranean occupied the Rocky mountain geosyncline and its sediments, mostly clastics from the late Jurassic mountains to the west, eventually obliterated the seaway and made another great alluvial lowland with swamps and sluggish streams. The late Cretaceous coal beds of this part of the United States are second only to the Pennsylvanian coal reserves.

Major orogeny again followed thick sedimentation in a subsiding trough. Thrusting from the west at the end of Cretaceous time compressed the weak Cretaceous strata and all subjacent rocks into uplifted folds and fault blocks along the entire length of this geosyncline. The making of the Rocky mountain system, coinciding with that of other systems on other continents, is therefore the time marker for closing the Mesozoic era and opening the Cenozoic.

In plant evolution, Cretaceous time saw the appearance of angiosperms (plants with covered seeds), dominant among land plants ever since. The reptilian horde reached its climax and gave place, following the Rocky mountain revolution, to mammals of almost all existing orders. From the variety of land-living organisms and the known palaeogeography, Cretaceous climates are judged to have been about as diversified as those of today.

The Cenozoic Era.—Almost all landscapes of the world, whatever their character, are products of Cenozoic events. In the United States existing mountain ranges are Cenozoic uplifts, most of them along the axes of earlier orogenies. Most of them have summit flats or accordances, surviving from a peneplanation that had destroyed earlier deformative uplifts. Plateaus are broad uplifts with little deformation or are lava-flooded areas. All volcanic cones of the country are Cenozoic growths. The great drainage systems were outlined and developed during this era, as were all coast lines. The monotonous plains are determined by Cenozoic stream and coastal deposits, the debris derived from destruction of the late Mesozoic and early Cenozoic highlands. All lake country in the northern states records a late Cenozoic ice-sheet glaciation. All soils and subsoils are Cenozoic in age. Almost all existing exposures of older rocks are the result of the vigorous erosion of Cenozoic time. Most of these features are consequences of crustal movements which produced at the maximum as emergent a condition and as great a relief as the continent has ever had.

The two Cenozoic periods are differentiated on the basis of climate, the coming of the "Ice Age" closing the Tertiary and inaugurating the Quaternary. Marine overlaps were limited to coastal lowlands and the lower Mississippi valley. Cenozoic formations therefore are largely nonmarine deposits occupying intermontane basins and piedmont areas. The life record thus is



GOODE BASE MAP NO. 209. COPYRIGHT BY THE UNIVERSITY OF CHICAGO. USED BY PERMISSION OF THE UNIVERSITY OF CHICAGO PRESS

GEOLOGICAL MAP OF THE UNITED STATES

largely of land animals and plants.

The story of Cenozoic erosion, generalized, is that of the reduction of early highlands to worn-down peneplains which truncated the stumps of the newly made Rockies and the rejuvenated Appalachians and are recognizable even in the landscapes of the Appalachian plateaus and the central lowlands. Several times of renewed uplift interrupted this erosion and complicated the record with successive partial peneplains whose remnants today constitute accordant summits and steplike erosional flats at lower altitudes. Rivers came to flow across such base-levelled surfaces without respect to hard or soft rocks below their valley bottoms. In later uplifts many hard rock crossings have become spectacular water gap canyons in all areas of pre-Cenozoic folding and faulting. Other canyons are due to physiographic youth alone. Quaternary glaciers aided in the deep sculpturing of many western mountain ranges. The submerged continental shelf is notched by submarine canyons that seem to date from greatly lowered ocean levels at times during the era. Elevated shore lines tell of other times when the ocean level was higher even than now.

Cenozoic deposits made by streams, wind and glacial ice and in lakes of closed basins are limited to favourable places, are very diverse in character, and in many cases are difficult to correlate. Particularly difficult has been the correlation of coastal marine sediments with the intermontane, although each class possesses a wealth of palaeontologic material.

The Gulf coast Tertiary rocks have been penetrated from below by a large number of cylindrical salt domes or plugs, the salt derived from older rocks and forced upward "like grease in a grease gun" (R. C. Moore) at weaker points. Another noteworthy feature of the Gulf coast is an actively subsiding structural and sedimentational trough across southern Louisiana, known from well logs to contain Tertiary sediments twice as thick as the Gulf is deep. It is pointed out as a modern geosyncline.

Cenozoic vulcanism was most marked in the Pacific border states where a row of towering cones surmounts the Cascade range and where the Columbia plateau of nearly horizontal lava flows covers about 200,000 sq.mi. Yellowstone park plateau is another well-known area of late Cenozoic vulcanism, its geysers testifying to hot rock at no great depth.

An orogeny which is still continuing began in middle Tertiary time. Most of the displacements were by faulting and occurred (and still are occurring) along the west coast. A continental uplift throughout the country seems to have been contemporaneous with this.

Of much significance to human occupation was the extensive continental glaciation in Quaternary time. Canada, the source area of the great ice sheet, four times sent its marginal overflow south into the Great Lakes and central lowlands region, and four times was melted back in the as yet unexplained climatic oscillations. The interglacial stages had climates as mild as, even milder than, that of the present. The Ohio and Missouri river courses were determined by these encroachments of glacial ice, the Great Lakes basins outlined and the cover of "drift" deposited over the region invaded. Outwash gravel and sand is traceable down the Mississippi to within 150 mi. of the Gulf. Dust blown off these outwash tracts settled on drift-covered and driftless areas alike to constitute the fertile loess soils of Mississippi valley states. The ice-weighted part of the continent sank under its load and is still slowly rising from removal of that load. Perhaps 1,000,000 years would measure the glacial experience. The entire era was about 60 to 70 times as long.

The present forests of deciduous trees were already outlined at the close of Mesozoic time. Grasses possessed the Cenozoic subhumid plains. Herbivorous mammalian evolution responded to the new food plants and carnivorous mammals swarmed to prey on the herbivores. Migration from other continents brought many kinds to North America, other kinds evolved here and spread to South America and the eastern hemisphere. Land bridges for such migrations, presumably in high latitudes, were essential. Extinctions of earlier mammals went along with appearance and deployment of newer types. The Tertiary record of these faunal changes is wonderfully detailed and diversified. Early human cultures arrived from Eurasia late in the Quaternary period, charcoal

and flint implements being far more numerous, however, than skeletal remains.

To the igneous and crustal activity of Cenozoic time are due most of the metalliferous veins of the western states. Some of the large oil pools of the United States are found in Cenozoic sediments as are also the Pacific coast coal deposits and the "bench" placers in California.

BIBLIOGRAPHY.—Two authoritative texts with special treatment of the geology of the United States are R. C. Moore, *Introduction to Historical Geology* (1949), and Carl O. Dunbar, *Historical Geology* (1949). Moore's book is somewhat more elementary but gives considerable attention to the evolution of life. Voluminous geological reports and many maps have been issued by the U.S. Geological Survey, and the geological surveys of most of the states. All publications on North American geology are elaborately cross-indexed in a series of bulletins of the U.S. Geological Survey. (J H. Bz.)

III. CLIMATE

The climate, or average weather, within the continental United States exhibits a wide diversity although the country lies almost wholly within the "prevailing westerly wind" belt. The characteristics of this generally easterly drifting air are changed as the air crosses the continent; these modifications are caused by changes of latitude and altitude, proximity to oceans and their currents, ascent and descent of the air over high mountain barriers and flow across the low smooth interior. Further, surges of polar and tropical air masses, and the several types of "storms" add their effects to increase the variety of climates. The effectiveness of each of these so-called controls differs from one place to another. However, there are wide areas within which the characteristics of temperature, precipitation, etc., are nearly similar, but are distinctly different from the characteristics of adjacent areas.

Based solely on moisture characteristics, especially with respect to effectiveness on either native or cultivated vegetation, C. Warren Thornthwaite divided the United States into five climatic provinces: superhumid, humid, subhumid, semiarid and arid. These provinces are large, may extend through a latitudinal range of 10° or more and may be subjected to alternating flows of polar *v.* tropical or marine *v.* continental air masses. Though each province may experience rather wide variations in temperature, except on the highest mountains, at least three months or more of the year have temperatures conducive to plant growth.

Superhumid Province.—This is found along the north Pacific coast inland to the crest of the Cascade mountains. Precipitation varies from more than 30 to more than 150 in. Winter is the distinct wet season, the precipitation being caused by frequent "cyclonic" storms which enter the United States in this latitude and by ascent of the wind up the Olympic, Cascade and Coastal ranges. In the mountains much of the precipitation falls as snow which may be 10 to 30 ft. deep by the end of March. Summer is predominantly dry, most stations receiving less than one inch each summer month. So little precipitation falls during the summer that there is a distinct water deficiency despite the enormous surplus that falls in the rest of the year. Temperatures are relatively high during the winter rainy season, averaging about 40° F. at sea level—much higher than to the east at the same latitude. The highest summer temperatures rarely reach 90° F. and the warmest month is much cooler than it is inland. This is the cloudiest region in the United States, 140 to 200 days overcast, but there may be more than 80 clear days, mostly in summer, each year. It is foggy in the summer along the immediate coast and in fall inland from the coast. It has fewer than ten thunderstorms per year.

Humid Province.—All of the United States east of a line from Lake Superior to the Texas coast and scattered small areas in the western mountains have adequate rainfall varying from not less than 30 in. to slightly more than 50 in. per year. It is nicely distributed for plant growth because the rainier season is in summer. This seasonal distribution is the result of convectional showers, "cyclonic" storms and thunderstorms; the latter occur between 25 (northern part) and 80 (central Florida) times a year. Much of the winter precipitation is snow north of the Ohio river where it may cover the ground from 40 days to nearly 150 days (northern Michigan). Along the Gulf coast snow is rare. The average annual temperature is less than 40° F. in northern Minnesota but increases to 70° F. along the Gulf coast and 75° F. in southern Florida. In January the averages are 5° F., 55° F., and 70° F. respectively. Arctic and polar air may flow easily and rapidly across this area, bringing "cold wave" temperatures in its wake. Coldest observed are about −50° F. in Minnesota, −20° F. in Tennessee, 0° F. in northwest Florida, and 40° F. in Key West. In summer there is little difference from the northern part (65° F., July average) to the southern part (80° F.). Except for southern Florida and eastern Maine, temperatures of 100° F., or higher have been observed everywhere in this province. There are about 100 frost-free days in the north and about 300 along the Gulf coast. Killing frosts may occur each year down to central Florida. Frost may penetrate the soil to depths of four to six feet in the north. In general, there are from 100 to 140 clear and 100 to 140 overcast days each year except in Florida. Dense fog is present from 5 to 30 times a year, chiefly in winter. Prolonged drought in summer is rare, but "hot waves," caused by flows of warm and very moist air from the Gulf of Mexico, are frequent. During the autumn months devastating hurricanes, with wind speeds up to 125 m.p.h. and torrential rain, may strike Florida or, less commonly, the Gulf coast.

Subhumid Province.—This province is a belt 300 to 500 mi. wide to the west of the humid province. The western boundary is a north-south line from mid-North Dakota through Texas. Its position is more distant from moisture-bearing winds from the Gulf of Mexico and the Atlantic ocean and thus has less precipitation than the humid province. From east to west the annual totals decrease from about 30 to 18 in. along the Canadian border and from more than 40 to about 25 in. in southern Texas. The higher temperatures and greater evaporation in the south make the precipitation less effective for plant growth than it is to the north. Most of the precipitation falls during the warmer half year; it is largely concentrated in the late spring-early summer months which is especially important for cereal crops. The amount of precipitation varies considerably; Richard J. Russell stated that along the east side 1 year in 20 is semiarid, whereas along the western boundary 10 years in 20 are semiarid. Temperatures are strikingly continental; *i.e.*, cold in winter and hot in summer, and are quite similar to those of the western edge of the humid province. Rapid and large temperature changes are a winter characteristic with blizzards and cold waves in the north and "northers" in the south of frequent occurrence. In North Dakota temperatures of −50° F. have been observed and in central Texas, 0° F. Summer temperatures are nearly the same from north to south despite the 25° difference of latitude. Highest temperatures recorded have been between 105° and 115° F. The frost-free season is the same as the western part of the humid province.

Semiarid Province.—West from the subhumid province to the eastern slope of the Rocky mountains is an unbroken belt, 300 to 500 mi. wide, from Mexico into Canada and much of the area between the Cascade-Sierra Nevada ranges and Rocky mountains which is the semiarid province. Most of it is higher than 3,000 ft. above sea level. Being still farther removed from moist Gulf of Mexico and Atlantic air, and with only dry air from the Pacific reaching this area, there is still less rain and snow than to the east. In northern Montana the annual average is about 12 in.; this increases to about 25 in. in the south of Texas. Over the Great Plains the rainy season is late spring-early summer from convection and cyclonic storms. Much of the rain falls as intense showers with as much as one-third the annual amount falling in a single day; contrariwise, two, three or four months may pass without any rain. Hail is frequent in spring and early summer. In the intermountain area the precipitation is more evenly spread throughout the year. Twenty to 40 in. of snow may fall during the winter, but ordinarily does not remain long. Chinooks, warm, dry air descending on the lee (east) slope of the Rockies, are fairly frequent during the winter. Lowest winter temperatures have varied between −66° F. (Yellowstone park) and 10° F. (Texas) and highest summer temperatures have

ranged between 105° F. and 115° F.

The great valley of California, while having the same amount of rain as the Great Plains and Rocky mountain areas, is quite different in that almost no rain falls from May to September. Winter rain is caused by cyclonic storms and by ascent over mountains. Summer drought is so long that nearly all crops must be irrigated. Summer temperatures closely approach those of the arid province. Killing frosts occur regularly each year. Snow, hail and thunderstorms are almost unknown at low altitudes and fog is a frequent winter phenomenon.

Arid Province.—This province is largely restricted to parts of Nevada, Utah, Arizona, New Mexico, southeast California and some of southwest Texas. Precipitation is generally less than 10 in. per year, most of which falls as showers during the summer. The smallest annual average is 1.35 in. per year, at Greenland Ranch, Calif. Summer temperatures are so high, and hence evaporation is so great, that no cultivated crops can be raised without irrigation. July averages about 80° F. and highest temperatures are well above 110° F. On July 10, 1913, 134° F., second highest in the world, was recorded at Greenland Ranch. Winter averages well above freezing though frost may be expected during at least two months each year. More than 200 clear days and 60 or less overcast days occur each year; Yuma, Ariz., averages more than 280 days clear and more than 90% of the total possible amount of sunshine. Because of the clear dry air it is not uncommon for midafternoon temperatures to be 40° to 50° warmer than those at sunrise.

BIBLIOGRAPHY.—An extensive tabulation of climatic data of the United States is contained in U.S. Weather Bureau publication, *Climatic Summary of the United States from Establishment of Stations to 1930, Inclusive,* (106 sections) and in *Climate and Man,* Yearbook of the Department of Agriculture (1941); numerous maps and graphs of many climatic elements are in three parts of the *Atlas of American Agriculture,* (U.S. Department of Agriculture): (1) "Frost and the Growing Season"; (2) "Precipitation and Humidity"; and (3) "Temperature, Sunshine and Wind." Current climatological data will be found in the *Monthly Weather Review* (Washington). Other works on climate include R. De C. Ward, *Climates of the United States,* (1925); J. B. Kincer, "Sunshine in the United States," *Mo. Weather Rev.,* vol. 48 (1920), "Seasonal Distribution of Precipitation and its Frequency and Intensity in the United States," *Mo. Weather Rev.,* vol. 47 (1919); C. F. Brooks and others, *Climatic Maps of North America* (1936); C. Warren Thornthwaite, "An Approach Toward a Rational Classification of Climate," *Geog. Rev.,* vol. 38 (1948); Richard J. Russell, "Dry Climates of the United States, II. Frequency of Dry and Desert Years, 1901–1920," *Calif Univ. Pub.,* Geog. 5 (5).

IV. FAUNA AND FLORA

Fauna.—The fauna of the United States includes most of the types of animals of temperate and arctic North America; indeed, when Alaska is included, the only conspicuous type missing is the musk ox of northeastern Canada, only lately extinct in Alaska and Eurasia. Only a very few properly tropical forms enter the limits of the United States. A few tropical frogs and snakes enter extreme southern Texas, and the American crocodile is present in southern Florida; the formerly more wide-ranging jaguar and ocelot are scarcely to be found north of the Rio Grande, though the common armadillo, which represents a distinctively South American group, has extended its range as far east as the Mississippi and north into Oklahoma. The treeless arctic tundra, where the subsoil remains frozen throughout the year, has striking circumpolar animals, like the lemmings, the ptarmigan, the arctic fox and the polar bear, all of which are little or not at all different from the corresponding forms in Siberia and Lapland. The tundra proper enters the territory of the United States only in Alaska.

Excluding from consideration these tropical and arctic elements, the fauna of the United States falls into a well-marked pattern, associated with the more conspicuous botanical formations. The southeastern region of hardwood and pine, a rich mixed forest, extends somewhat beyond the Mississippi, contrasting sharply with the Sonoran desert of the southwest. The great central grasslands from the Dakotas to the Gulf contrast as sharply with the transcontinental coniferous forest at the north; this forest sends great "peninsulas" southward in the Appalachian and Rocky mountains, accompanied by northern types of animals.

The Rocky mountains, with other western ranges, supply a suitable environment for various rock-dwelling types, whose relatives are found in the mountain ranges of Eurasia. The more western ranges, the Cascades and the Sierra Nevada, and the Pacific coastal region, have a distinctive fauna with a mixture of unique elements and of forms related to those of the southeastern forest region. The Pacific region has a varied flora, mostly sharply distinct from that of the southeastern forest.

Arrangement of the account of the distribution of the fauna of the United States according to these regional provinces has the merit that it can be compared further with the distribution of insects and of other invertebrates, some of which may be expected to fall into the same patterns as the vertebrates, while others, with different modes or different ages of dispersal, will have geographic patterns of their own.

The transcontinental zone of coniferous forest at the north, the taiga, and the tundra zone into which it merges at the northern limit of tree growth, are strikingly paralleled by similar zones in the Rockies and on Mt. Washington in the east, where the area above timber line and below snow line is a kind of tundra, often with tundra animals like the ptarmigan and the white *Parnassius* butterflies, while the spruce and other conifers below timber line form a belt sharply set off from the grassland or hardwood forest or desert at still lower altitudes.

A whole series of important types of animals spread beyond the limits of such regions or zones, sometimes over most of the continent. Aquatic animals, in particular, may live equally in forest and plains, in the Gulf states and at the Canadian border. Such widespread animals include the Virginia deer and black bear, the puma and bobcat, the otter and mink, and the beaver and muskrat. The distinctive coyote ranges over all of western North America and eastward to Wisconsin. The larger gray wolf is found throughout the continent. The snapping turtle ranges from the Atlantic coast to the Rocky mountains.

At the north, in the coniferous forest zone, the relations of animals with European or Eurasian representatives are numerous and this zone, often referred to under the Siberian name of "taiga," is essentially also circumpolar. The relations are less close than in the arctic forms, but the American moose represents the Eurasian elk, and beaver, hare, red fox, otter, wolverine and wolf are equally familiar as names for recognizably related animals on the two sides of the Atlantic. Even some fishes, like the whitefishes (Coregonidae), the yellow perch and the pike, exhibit this kind of old world-new world relation. A distinctively American element in this taiga assemblage is supplied by the Canada porcupine.

The hardwood forest area of the east and the southeastern pinelands compose the most important of the faunal regions within the United States. A great variety of fishes, amphibians and reptiles of this region have related forms in eastern Asia, and this pattern of representation is likewise found in the flora. This area is rich in catfishes, minnows and suckers. The curious ganoid fishes, the bowfin and the gar, are ancient types. The "spoon-billed cat," a remarkable type of sturgeon in the lower Mississippi, is represented elsewhere in the world only in the Yangtze in China. The Appalachian region is headquarters for the salamanders of the world, with no less than seven of the eight families of this large group of amphibians represented; no other continent has more than three of the eight families together. The eel-like sirens and amphiumas are confined to the southeastern states. The lungless salamanders of the family Plethodontidae exhibit a remarkable variety of genera and a number of species centring in the Appalachians. There is a great variety of frogs, and these include tree frogs of the genus *Hyla,* whose main development is South American and Australian. The emydid freshwater turtles of the southeast parallel those of eastern Asia to a remarkable degree, though the genus *Clemmys* is the only one represented in both regions. Much the same is true of the water snakes (*Natrix*), the pit vipers (*Ancistrodon*) and various other genera of snakes (*Elaphe, Opheodrys*), though still others are peculiarly American. The familiar alligator is a form with an Asiatic relative, the only other living true alligator being a species in

DISTRIBUTION OF THE MAIN TYPES OF NATURAL VEGETATION IN THE UNITED STATES. THE THREE MAJOR NATURAL DIVISIONS OF VEGETATION ARE FOREST, GRASSLAND AND DESERT SHRUB. THE FOREST FALLS INTO TWO CLEARLY MARKED REGIONS, WESTERN AND EASTERN.* THE WESTERN REGION COMPRISES SEVEN LARGE FOREST SUBDIVISIONS AND TWO SUBDIVISIONS OF WOODLAND. THE EASTERN REGION COMPRISES NINE FOREST SUBDIVISIONS. FOUR-FIFTHS OF THE FOREST WAS ORIGINALLY IN THE EAST. OF THIS ORIGINAL FOREST THERE REMAINS NOW ONLY ABOUT 10 PER CENT IN VIRGIN CONDITION, 50 PER CENT HAVING BEEN CLEARED FOR FARMLAND, 30 PER CENT CUT OVER AND NOW GROWN UP TO TREES OF SUFFICIENT SIZE FOR SAW LOGS OR CORDWOOD, AND ABOUT 10 PER CENT CUT OVER OR DEVASTATED BY FIRE AND REDUCED TO BRUSHLAND

central China.

In its mammals and birds the southeastern fauna is less sharply distinguished from the life to the north and west and is less directly related to that of eastern Asia. The forest is (or was) the home of the Virginia deer, the black bear, the gray fox, the raccoon and the common opossum. The wild turkey and the only lately extinct hosts of the passenger pigeon were characteristic. There is a remarkable variety of woodpeckers. The bird life in general tends to differ from that of Eurasia in the presence of birds, like the tanagers, American orioles and hummingbirds, that belong to South American families. Small mammals abound with types of the world-wide rodent family Cricetidae, and with distinctive moles and shrews.

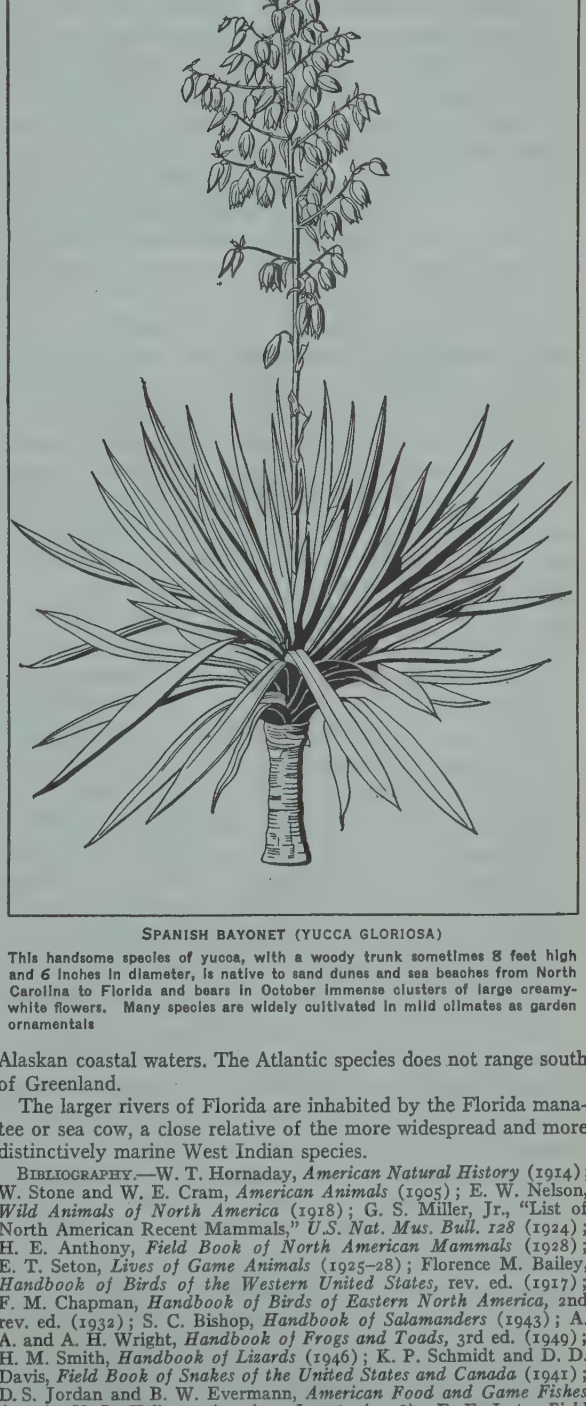
The western grasslands merge by insensible degrees into semi-desert and desert toward the great basin and the Sonoran desert. Most distinctive of the grassland animals proper is the American bison, whose nearly extinct European relative, the wisent, is found in the forest. The most distinctive of the American hoofed animals is the prongbuck, which represents a family intermediate between the deer and the true antelopes in that it sheds its horns like a deer but retains the bony horn cores. The prongbuck is perhaps primarily a desert mammal, but it formerly ranged widely into the short-grass plains. Everywhere in open country in the west there are conspicuous and distinctive rodents. The burrowing pocket gophers are peculiarly American, rarely to be seen, but making their presence known by their pushed-out mounds of earth. The ground squirrels of the genus *Citellus* are related to those of central Asia, and resemble them in habit; in North America the gregarious prairie dog is a closely related form. The American badger, not especially related to the badger of Europe, has its headquarters in the grasslands. The prairie chicken is a bird distinctive of the plains region, which is invaded everywhere by birds from both the east and the west.

The Sonoran desert of the southwest, which may be regarded as including southeastern California, southern Nevada and Arizona, a corner of Utah, parts of New Mexico and extreme western Texas, is a paradise for reptiles. Distinctive lizards abound, and the rattlesnakes, of which only a few species are found elsewhere in the United States, have their headquarters there. Among lizards the poisonous Gila monster is wholly Sonoran, though with a Mexican relative. Sonoran types range to the Pacific coast and northward in the great basin. Noteworthy mammals are the graceful bipedal kangaroo rats (almost exclusively nocturnal), the ring-tailed cat, a relative of the raccoons, and the piglike peccary.

The Rocky mountains and other western ranges afford distinctive habitats for rock and cliff dwelling hoofed animals and rodents. The little pikas, related to the rabbits, live in the rock-slides at high altitudes as they do in the mountain ranges of eastern Asia. Marmots live in the Rockies as in the Alps. Every west American range formerly had its own race of mountain sheep. At the north the so-called Rocky mountain goat lives at high altitudes—it is more properly a goat antelope, related to the takin of the mountains of western China. The dipper, remarkable for its habit of feeding in swift-flowing streams, though otherwise a bird without special aquatic adaptations, is a Rocky mountain form with relatives in Asia and Europe.

In the Pacific region, the extremely distinctive frog *Ascaphus*, which inhabits icy mountain brooks, represents a family of frogs by itself, perhaps more nearly related to the frogs of far-off New Zealand than to more familiar types. The Cascades and Sierras form centres for salamanders of the families Ambystomidae and Plethodontidae second only to the Appalachians, and there are also distinctive newts. The burrowing lizards, of the well-defined family Anniellidae, are found only in a limited area in coastal California. The only family of birds distinctive of North America, that of the wren tits, Chamaeidae, is found in the chaparral of California. The mountain beaver, *Aplodontia* (which is not at all beaverlike), is likewise a type peculiar to North America, confined to the Cascades and Sierras; and there are distinct kinds of moles in the Pacific area.

The mammals of the two coasts are strikingly different, though true seals (the harbour seal and the harp seal) are found on both. The sea lions, with longer necks and with projecting ears, are found only in the Pacific—the California sea lion, the more northern Steller's sea lion and the fur seal. The breeding rookeries of the latter are now confined to the Pribilof Islands in the Bering sea. The Pacific walrus is distinctively a creature of the



SPANISH BAYONET (YUCCA GLORIOSA)

This handsome species of yucca, with a woody trunk sometimes 8 feet high and 6 inches in diameter, is native to sand dunes and sea beaches from North Carolina to Florida and bears in October immense clusters of large creamy-white flowers. Many species are widely cultivated in mild climates as garden ornamentals

Alaskan coastal waters. The Atlantic species does not range south of Greenland.

The larger rivers of Florida are inhabited by the Florida manatee or sea cow, a close relative of the more widespread and more distinctively marine West Indian species.

Flora.—The dominant features of the flora of the United States are indicated by the terms forest, grassland, desert and alpine tundra. A coniferous forest of white and red pine, hemlock, spruce, jack pine and balsam fir extends interruptedly in a narrow strip near the Canadian border from Maine to Minnesota and southward along the Appalachian mountains. Here may be found smaller stands of tamarack, spruce, paper birch, willow, alder and aspen or poplar. Southward, a transition zone of mixed conifers and deciduous trees gives way to a hardwood forest of broad-leaved trees. This forest, with varying mixtures of maple, oak, ash, locust, linden, sweet gum, walnut, hickory, sycamore, beech and the more southerly tulip tree, once extended uninterruptedly from New England to Missouri and eastern Texas. Pines are prominent on the Atlantic and Gulf coastal plain and adjacent uplands, often occurring in nearly pure stands called pine barrens. Pitch, longleaf, slash, shortleaf, Virginia and loblolly pines are most common. Hickory and various oaks combine to form a significant part of this forest, with magnolia, white cedar and ash often seen. In the frequent swamps, bald cypress, tupelo, white cedar and cane predominate. Pines, palmettos and live oaks are replaced at the southern tip of Florida by the more tropical royal and thatch palms, figs, satinwood and mangrove.

The grasslands occur principally in the Great Plains area and extend westward into the intermontane basins and benchlands of the Rocky mountains. Numerous grasses such as buffalo, grama, side oat, bunch, needle and wheat grass, together with many kinds of herbs, make up the plant cover. Coniferous forests cover the lesser mountains and high plateaus of the Rocky mountains, Cascades and Sierra Nevada. Yellow pine, Douglas fir, western larch, white pine, red cedar, lodgepole pine, several spruces, coast hemlock, grand fir, red fir and the lofty redwood are the principal trees of these forests. The densest growth occurs west of the Cascade and Coast ranges in Washington, Oregon and northern California, where the trees are often 100 ft. or more in height. Here the forest floor is so dark that only ferns, mosses and a few shade-loving shrubs and herbs may be found.

The alpine tundra, found in the United States only in the mountains above the limit of trees, consists principally of small plants that bloom brilliantly for a short season. Sagebrush is the most common plant of the arid basins and semideserts west of the Rocky mountains, but juniper, nut pine and mountain mahogany are often on the slopes and low ridges. The desert, extending from southeastern California to Texas, is noted for the many cacti, some of which grow to the height of trees; the joshua tree and other yuccas, creosote bush, mesquite and acacias.

The United States is rich in the variety of its native forest trees, some of which, as the species of sequoia, are the most massive known. C. S. Sargent described 717 species, together with numerous varieties; G. B. Sudworth gave the names and geographical distribution of 1,177 species and varieties. Of these, 182 are of economic value, either because of the timber and other useful products which they yield or by reason of their importance in forestry.

Besides the native flowering plants, estimated to comprise from 20,000 to 25,000 species, many hundreds of species, introduced from other regions—chiefly Europe, Asia and tropical America—have become naturalized. A large proportion of these are common annual weeds of fields, pastures and roadsides. In some districts these naturalized "aliens" comprise 50% or more of the total plant population. W. L. Jepson enumerated 4,019 species, of which 3,727 are native to the state (1,416 species endemic) and 292 (7%) naturalized from other regions. In the northeastern United States from Minnesota to Kansas and eastward the proportion of introduced species is much greater, *Gray's Manual of Botany* (1950) giving 7,135 species and varieties of which 5,912 are native and 1,223 (17%) introduced.

V. POPULATION AND SOCIAL CONDITIONS

Geographical Growth of the Nation.—The achievement of independence found the people of the United States owning the entire country from the Gulf of Mexico to the Great Lakes, excepting Florida, as far west as the Mississippi river; but the actual settlements were, with a few minor exceptions, confined to a strip of territory along the Atlantic shore. The depth of settlement, from the coast inland, varied greatly, ranging from what would be involved in the mere occupation of the shore for fishing purposes to a body of agricultural occupation extending back to the base of the great Atlantic chain, and averaging about 250 mi. Westward, beyond the general line of continuous settlement were four extensions of population through as many gaps in the Appalachian barrier, constituting the four main paths along which migration westward first took place: the Mohawk valley in New York; the upper Potomac—upper Ohio river connections; the Appalachian valley through southwestern Virginia into Tennessee; and, around the southern base of the Appalachian system. Four outlying groups beyond the mountains—one about Pittsburgh, one on the Great Kanawha river in West Virginia, one in northern Kentucky and the last along the Cumberland river in Tennessee—constituted perhaps a 20th part of the total population of the nation. Finally, there were in 1790 about a score of small trading and military posts, mainly of French origin, scattered over the then almost unbroken wilderness of the upper Mississippi valley and region of the Great Lakes.

The returns for the 17 decennial censuses of the United States are summarized in Table I.

TABLE I.—*Population of Continental United States*

Census years	Land area in square miles	Population	Decennial increase per cent	Population per square mile	Number of aliens admitted in preceding decade*
1790	867,980	3,929,214	—	4.5	—
1800	867,980	5,308,483	35.1	6.1	—
1810	1,685,865	7,239,881	36.4	4.3	—
1820	1,753,588	9,638,453	33.1	5.5	250,000†
1830	1,753,588	12,866,020	33.5	7.3	151,824
1840	1,753,588	17,069,453	32.7	9.7	599,125
1850	2,944,337	23,191,876	35.9	7.9	1,713,251
1860	2,973,965	31,443,321	35.6	10.6	2,598,214
1870	2,973,965	39,818,449‡	26.6	13.0	2,314,824
1880	2,973,965	50,155,783	26.0	16.9	2,812,191
1890	2,973,965	62,947,714	25.5	21.2	5,246,613
1900	2,974,159	75,994,575	20.7	25.6	3,687,564
1910	2,973,890	91,972,266	21.0	30.9	8,795,386
1920	2,973,776	105,710,620	14.9	35.5	5,735,811
1930	2,973,776	122,775,046	16.1	41.1	4,107,296
1940	2,977,128	131,669,275	7.2	44.2	528,431
1950	2,974,725	150,697,361	14.5	50.7	1,035,039

*Figures represent number of immigrant aliens admitted, that is, gross immigration; deducting emigrant aliens departed, the net figures for the decade ending in 1910 are 5,167,504; for 1910–20, 3,588,817; for 1920–30, 3,062,133; for 1930–40, 68,693; and for 1940–50, 878,640.
†Estimated total up to 1820.
‡Revised figure.

Except for the isolated military or trading posts, which always preceded the settlement frontier, the population advanced across the prairie region of the midwest with a practically solid front until halted for a time at the eastern edge of the Great Plains. The north and the south sections of the country started out with population growths in the decade 1790–1800 very nearly equal (36.5% and 33.7%); but in every succeeding decade before the Civil War the rate of growth of the north was greater, and that of the south less, than its increment in the initial decade. In 1790 the two sections were almost of equal population; by 1890, the population of the north was practically double that of the south.

In the decade 1890–1900 the increase of the south exceeded slightly that of the north, because of the rapid development of the southern states west of the Mississippi, but in general the increase of the two sections thereafter was nearly equal.

The temporary halt in the western advance at the edge of the Great Plains was caused by the comparative aridity of this region and the discovery of more desirable agricultural valleys and mineral wealth in the mountainous sections and Pacific coast states of the farther west. Population, therefore, leaped over these more barren regions and formed in isolated islands beyond. The first of these overland migrations, which were to become a feature of American life in that generation, was the migration over the Oregon trail to the Oregon country (beginning 1832), the Mormon emigration to Utah (beginning 1847) and the gold rush to California, by sea and the Overland trail (beginning 1848). By the treaty of 1848, ending the war with Mexico, a number of old Spanish settlements in the southwest were added to the population. Discoveries of mineral wealth between 1858 and 1880 in Colorado, Nevada, Idaho, Montana and Wyoming created other isolated areas of settlement in these states which spread gradually into the more attractive agricultural valleys of the mountains. Between 1880 and 1890 a large part of the Great Plains was taken up. But a small portion of this region was used for farming purposes until after 1900 when the system of dry farming (*q.v.*) became generally known. Settlement was then rapid up to the entrance of the United States into World War I, more land being settled than could be held during the period of agricultural depression which followed. Similarly the population of the mountain states to a large degree followed the rise or fall of prosperity in the mining industries, but the growth of agriculture in these states proved to be a stabilizing factor.

Growth of the Nation in Population.—Between 1790 and 1940 the population increased from 3,929,214 to 131,669,275, and then to 150,697,361 in 1950. The increase during the decade 1940–50 was thus 19,028,086, or more in absolute number than the increase in any earlier decade in the census history of the United States. On a percentage basis, the 1940–50 increase amounted to 14.5%, as compared with 7.2% between 1930 and 1940. The rate of increase, however, was lower than that in any census decade except the one just preceding. (*See* Table I.) In 1800, every important European country, even including Spain and Turkey, exceeded the United States in population; in 1950, only the Union of Soviet Socialist Republics had a larger population (unofficially estimated at something over 200,000,000). The population of the United States in 1900 was more than 14 times as large as in 1800, while the population of Belgium, then the fastest growing of the European countries, had only a little more than doubled during this 100-year period. Natural increase, however, which in Europe was the only important source of population growth, was only one of several factors in the United States. There were also very large additions to the population through immigration and much less important gains through the annexation of territory.

In 1790 there were about 600,000 white families in the United States. Speaking broadly, there were few very rich and few very poor. Both the social traditions and the religious beliefs of the people encouraged fecundity. The land was largely unsettled, and conditions for almost 100 years were such as to encourage migration westward and the establishment of new families under pioneer conditions. Labour was scarce and even on the farm it was difficult to obtain hired help. Under these conditions, large families possessed a direct economic advantage. Between 1790 and 1830 immigration contributed relatively little to the population increase of nearly 9,000,000, since the total immigration during this period was only about 250,000. The population increase, which amounted to about 34.5% per decade, was therefore mainly the result of the excess of births over deaths.

From 1830 to the Civil War the rate of increase in the total population of the country continued at the same rate as in the preceding 40 years, the decennial increase for the entire 70 years averaging 34.6% and in no case falling below 32.7%. But after 1830 an increasing proportion of this increase was the result of immigration, the accessions, especially in the decade 1840–50 from Ireland and Germany, being enormous, and the total immigration in that decade rising to 1,427,337 as compared with 538,381 during the preceding decade. It would appear, therefore, that while the natural increase of the native population was actually slowing up, the heavy and increasing immigration concealed this from view at the time. In 1850, 9.7% of the population was foreign-born, and in 1860, 13.2%.

The ten years from 1860 to 1870 witnessed the operation of the first great factor which reduced the rate of national increase, namely the Civil War. The superintendent of the ninth census, 1870, computed the effects of this cause, first, through direct losses, by wounds or disease, either in actual service of the army or navy, or in a brief term following discharge; secondly, through the retardation of the rate of increase in the Negro element caused by the privations, exposures and excesses attendant upon emancipation; thirdly, through the check given to immigration by the existence of the war; and finally, through the temporary reduction of the birth rate, resulting from the withdrawal of perhaps one-fourth of the national militia during four years—to be a loss to the population of 1870 of approximately 2,515,000.

The rate of population increase declined steadily from 26.6% in the decade 1860–70 to 20.7% in the last decade of the 19th century, though from 1900 to 1910 there was a slight rise to 21.0% resulting chiefly from a large immigration of 8,795,386 (net, 5,167,504). In the next decade, 1910 to 1920, the rate of growth dropped to 14.9%, with a net immigration of 3,588,817, and in the decade 1920 to 1930, with a net immigration of 3,062,133, it increased somewhat to 16.1%. Between 1930 and 1940, the rate of increase was only 7.2%, or less than half the rate recorded in any earlier decade. This abrupt change was due in part to the practical cessation of immigration and in part to a continued rapid decline in the birth rate. Between 1940 and 1950, however, the trend was reversed and the absolute number of persons added to the population of the United States was larger than in any earlier decade, though the rate of increase, 14.5%, or more than twice the 1930–40 rate, was still a bit smaller than the rate recorded for any of the pre-1930 decades. Increased immigration (878,640, net) contributed a little to this more rapid growth, but the increase resulted in the main from unexpected increases in the numbers of births.

The causes of the decline in the rate of natural increase in the later decades have been a subject of much speculation by sociologists. The decline was not peculiar to the United States, but was shared by practically all the industrialized countries in the world. It was not to be expected, of course, that the rate established from 1790 to 1830 by a vigorous and fertile race, in a new country endowed with tremendous natural resources, would continue indefinitely. Early in the 1870s Francis A. Walker, superintendent of the 1870 and 1880 censuses, upon noticing that in spite of increased immigration the population in 1860 was only 10,000 more than it would have been if the rate of natural increase up to 1830 had been maintained, expressed the opinion that the decline might be due to the "competitive shock" of immigration and that immigration had actually contributed little to the final total population but merely substituted foreign stock for native stock. A more generally accepted explanation, however, is that the decline in the rate of natural increase was due to industrial development and urbanization and the complex forces dependent upon these two. While large families are not so much of an economic asset, even in rural areas, as they were in the early days, they are at least less of an economic burden on the farms, where there is still much work that can profitably be done by the growing boys and girls, than in the cities, where almost everything that is used or enjoyed must be paid for in cash.

One other factor sometimes brought forward as an explanation of the decline in the birth rate is the growing tendency toward late marriages which seemed to prevail among the ambitious and intellectual classes. There is not much statistical support for the assumption of such a decline, however, since the percentage of the population married showed an almost continuous, though not rapid, increase from 1890 to 1940. In 1890, for example, 56.8%

TABLE II.—*Population of the United States by Regions, Divisions and States*

Region, division and state	1950	1940	Increase 1940–50	Per cent of increase 1940–50	Per cent of increase 1930–40

of the female population 15 years old and over were married, in 1910, 58.9%, in 1930, 61.1% and in 1940 (at the close of the depression decade), 61.0%. During the next decade, however, this percentage increased greatly, standing in 1950 at about 66.8%, the official figure being 65.5% of the female population 14 years old and over.

Mention is made in this connection also of the increase in the extent to which women, especially married women, are employed in a wide variety of business and professional pursuits. Here again, however, the change was most marked in the decade between 1940 and 1950. (*See* Table XIII below).

The much more rapid growth in population between 1940 and 1950 has already been noted. This increase in rate of growth was mainly the result of an unexpected increase in the birth rate (following a substantial increase in the marriage rate). The birth rate in 1920 (based on registered births) was 23.7; by 1930 the rate had declined to 18.9 and by 1933 to a minimum of 16.6, with slight fluctuations during the rest of the decade. A rate of 17.9 was recorded in 1940. The increases from that time on were rather rapid, with a high point of 21.5 in 1943 and then 23.3 in 1946, and a maximum of 25.8 in 1947, from which time to 1950 there was only a small decline. During the same period the death rate had gone down from 13.0 in 1920 to 11.3 in 1930; 10.7 in 1940, and 9.6 in 1950; and by 1946 there had been an appreciable resumption of immigration, the net immigration during the last five years of the decade ending July 1, 1950, amounting to more than 750,000.

The birth rates and death rates prevailing in the United States from 1939 to 1950 are presented in Table III, together with the

TABLE III.—*Vital Rates for the United States*

Year	Birth rate*	Death rate*	Marriage rate	Divorce rate
1939	17.3	10.6	10.7	2.9
1943	21.5	10.9	11.6	2.6
1946	23.3	10.0	16.4	4.3
1947	25.8	10.1	13.9	3.4
1948	24.2	9.9	12.4	2.8
1949	24.1	9.7	10.2	2.2
1950	23.5	9.6	11.8	—

*Rates per 1,000 of the population, based on registered births and deaths.

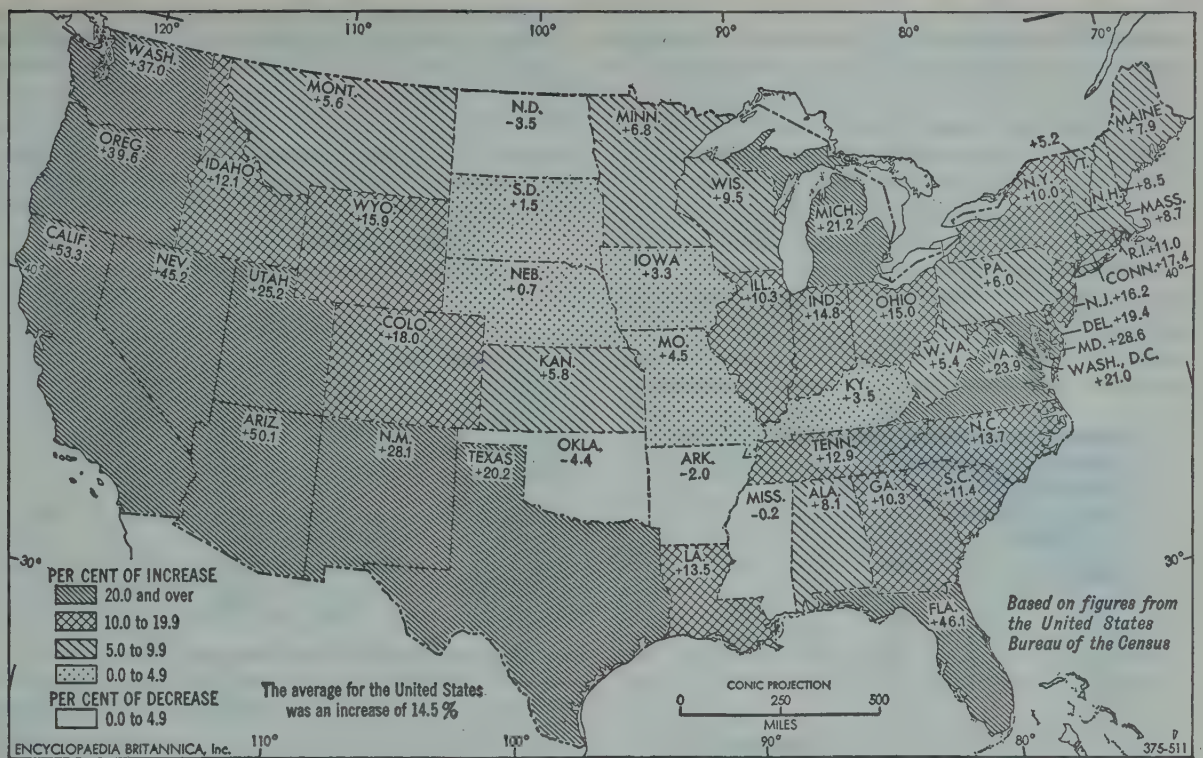

FIG. 1.—PER CENT OF CHANGE IN TOTAL POPULATION, BY STATES: 1940 TO 1950

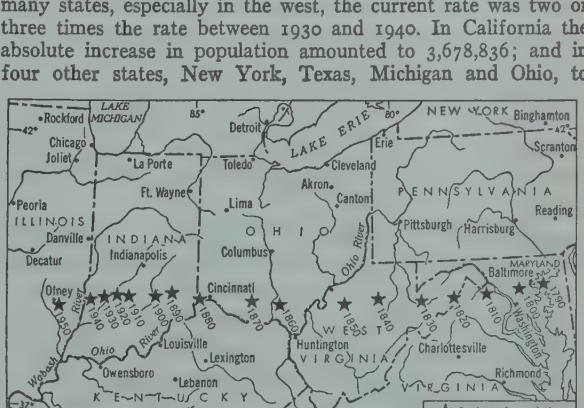
closely related rates for marriages and divorces. The total number of births in 1939, including an adjustment for underregistration, was 2,390,000; and the average for a number of years preceding was even smaller. By 1943, however, the number of births had increased to 3,209,000, followed by figures smaller by 200,000 or 300,000 in the next three years; then by the record number of 3,986,000 in 1947, or nearly 80% above the number recorded in 1933 (2,243,000), and around 3,700,000 in 1948, 1949 and 1950. The number of deaths, on the other hand, remained at about the same level, being 1,433,000 in 1939, 1,652,000 (the maximum) in 1945, and falling back to 1,467,000 in 1950.

While the population of the United States as a whole made unexpectedly large gains between 1940 and 1950, these gains were not by any means uniformly distributed over the country. Table II presents the population figures for 1940 and 1950, by states (grouped into divisions and regions), with rates of increase for the decade 1940–50 and for the preceding decade, 1930–40.

The total numerical increase between 1920 and 1930 was 17,064,426, of which again a very large fraction took place in the industrial states of the middle Atlantic and east north central divisions, New York recording a gain of more than 2,000,000, and Illinois and Michigan gains of more than 1,000,000 each. California, with an increase of 2,250,390, or 65.7%, showed the largest gain for any individual state, while Florida, with an increase of 51.6%, showed the next largest relative gain. Since the highest probable gain from natural increase, even under conditions existing in 1920, was less than 15%, it is obvious that gains such as those recorded for California and Florida must have resulted mainly from migration from other states.

The increase in the population of continental United States between 1930 and 1940 was 8,894,229, or 7.2% (as compared with 17,064,426, or 16.1%, between 1920 and 1930). While the contribution made to this increase by those states usually classified as industrial states was considerable, it was decidedly less in proportion to the total than in the three or four decades immediately preceding.

Two of the states showing the most significant increases between 1940 and 1950 were California and Florida; both had had heavy increases for several decades, largely because of in-migration from other states. Every state except Mississippi, Arkansas, Oklahoma and Idaho showed a higher rate of increase between 1940 and 1950 than in the preceding decade; and in many states, especially in the west, the current rate was two or three times the rate between 1930 and 1940. In California the absolute increase in population amounted to 3,678,836; and in four other states, New York, Texas, Michigan and Ohio, to



BY COURTESY OF U.S. BUREAU OF THE CENSUS

FIG. 2.—CENTRES OF POPULATION, 1790–1950

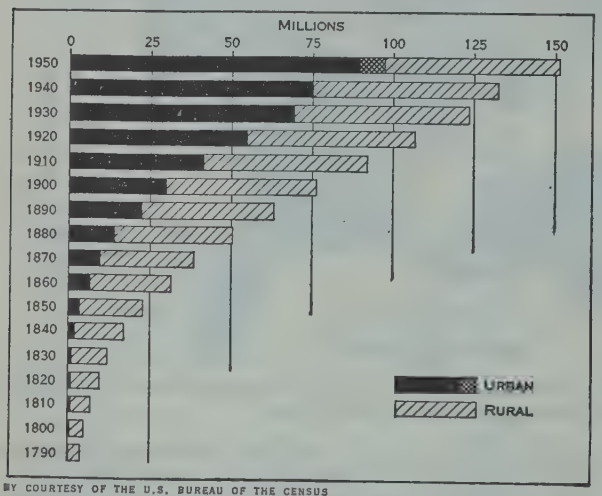
more than 1,000,000. Among the regions the increase was most rapid (40.9%) in the west, next (13.3%) in the south, with the north central (10.8%) and the northeast (9.7%) following.

The percentage increases during the decade ending in 1950 are indicated, by states, on the accompanying map of the United States (fig. 1). This map serves, incidentally, as a good indicator of the trends of internal migration within the United States, most of states with the black shading being states to which there was extensive movements of population from other parts of the

country between 1940 and 1950.

Centre of Population.—In 1790 the centre of population was located 23 mi. E. of Baltimore, Md., thus emphasizing the fact that the settlements were largely in the extreme eastern part of the country's area and also suggesting that the population was about evenly divided between the north and the south. By 1850 the centre had moved westward about 260 mi. to a point 23 mi. S.E. of Parkersburg, W.Va. By 1940 it had moved 320 mi. farther west, still following closely the 30th parallel, and was located 2 mi. S.E. of the village of Carlisle, in Sangamon county, Ind. The movement of the centre of population from 1790 to 1940 is shown on the accompanying map (fig. 2).

Urban and Rural Population.—In 1790 the population of the United States was almost entirely rural and supported directly from the soil. There were no large cities, and no industry of importance other than agriculture. There were only two cities with



BY COURTESY OF THE U.S. BUREAU OF THE CENSUS

FIG. 3.—URBAN AND RURAL POPULATION OF THE UNITED STATES: 1790 TO 1950

The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

more than 25,000 inhabitants, and only 24 places with more than 2,500. And it was not until toward 1820 that the largest city (New York) passed the 100,000 mark. In 1850 there were 26 cities of over 25,000, including one with more than 500,000 and five others with more than 100,000. In 1910 there were 50 cities with more than 100,000, including three with more than 1,000,000; and in 1940 there were 92 cities of over 100,000, including five with over 1,000,000.

Table IV shows the urban population and the number of urban places on selected dates from 1790 to 1950. The figures given for urban population in 1940 and earlier years represent the number of inhabitants living in incorporated places (cities, boroughs, villages and, in some states, towns), supplemented by small areas classified as urban under special rule in states where there were many large population aggregates not incorporated as cities or villages. For 1950 a new definition of urban population was set up including, in addition to the incorporated places of the earlier definition, 397 unincorporated places of 2,500 or more and the thickly settled suburban area, or "urban fringe," around all cities of 50,000 or more—these additional areas having an aggregate population of about 7,500,000. The rural population was in all cases that part of the total which was not classified as urban.

Up to 1830 the percentage of the population urban increased very slowly, which means that the growth of the urban population was little more rapid than that of the rural. Between 1830 and 1840 the percentage urban in the country as a whole increased from 8.8 to 10.8, or by not quite one-fourth.

In many individual states, however, the increase during this decade was much greater, the percentage urban in 1840 in some cases doubling that in 1830.

Between 1840 and 1850 the percentage urban in the country as a whole increased from 10.8 to 15.3, or by nearly one-half. This relative increase was exceeded in several of the older states, including Maine, New Hampshire, New Jersey and New York, but the most notable increases in urbanization during this period were in some of the newer states.

In the state of Ohio, for example, the percentage urban increased from 5.5 to 12.2; in Indiana, from 1.6 to 4.5; in Illinois, from 2.0 to 7.6; in Michigan, from 4.3 to 7.3; and in Missouri, from 4.3 to 11.8.

By 1850, settlement was well under way in most of the states which later attained a high percentage of urban population, and after that date the trend of the percentage urban in the country as a whole was less affected by the expansion of the settled area, or by the beginning of urbanization in the newer states, than it was in the decades preceding 1850.

In 1930 there were 21 states in which more than one-half of the population was urban. The census dates on which these states were first shown to have more than one-half of their population living in urban territory may be of some significance as indicating the geographic progress of urbanization over the country. Massachusetts and Rhode Island were the first of these states, their population being returned as more than 50% urban in 1850. New York was added to the list in 1870; New Jersey in 1880; Connecticut in 1890; and in 1900, Pennsylvania, Illinois and California. At the beginning of the 20th century, therefore, there were only 8 states in which the population was more than one-half urban. In 1910, New Hampshire, Ohio, Maryland, Colorado and Washington were added to the list; in 1920, Indiana, Michigan and Delaware; and in 1930, Wisconsin, Missouri, Utah, Florida and Oregon, though the percentage urban in Oregon had declined in 1940 to 48.8.

It is possible to compare the proportion urban in 1950 with that in 1940 and earlier on the basis of the 1940 definition, under which the urban population in 1950 would have been around 88,900,000, or 59.0% of the total. On this basis it would appear that the rate of urbanization which had prevailed up to 1930, when the population was 56.2% urban, had not been resumed.

This notation is supported by the fact that the 1940–50 increase in the urban population on the 1940 basis was only 18.7%, as

TABLE IV.—*Total and Urban Population of the United States*

Census year	Total population	Urban population		Number of urban places of		
		Number	Per cent of total	100,000 or more	25,000 or more	2,500 or more
1790	3,929,214	201,655	5.1	—	2	24
1820	9,638,453	693,255	7.2	1	5	61
1850	23,191,876	3,543,716	15.3	6	26	236
1880	50,155,783	14,129,735	28.2	20	77	939
1910	91,972,266	41,998,932	45.7	50	228	2,262
1940	131,669,275	74,423,702	56.5	92	412	3,464
1950*	150,697,361	96,440,528	60.4	106	477	4,270

*The definition of urban population was expanded for use in the 1950 census, as explained in the text. The 1950 figure given in the table (96,440,528) is a semifinal figure obtained by assuming that the proportion urban in the final population was the same as in the preliminary.

TABLE VI.—*Population of the U.S. by Colour, Nativity and Sex*
(Figures for 1950 are based on the tabulation of a small sample)

Subject	1950	1940	Per cent of increase	Per cent distribution	
				1950	1940
Colour and Nativity					
Total	150,697,000	131,669,275	14.5	100.0	100.0
White	135,215,000	118,214,870	14.4	89.7	89.8
Native white	125,068,000	106,795,732	17.1	83.0	81.1
Foreign-born white	10,147,000	11,419,138	−11.1	6.7	8.7
Nonwhite	15,482,000	13,454,405	15.1	10.3	10.2
Negro	14,894,000	12,865,518	15.8	9.9	9.8
Other races	588,000	588,887	−0.2	0.4	0.4
Sex					
Male	74,633,000	66,061,592	13.0	49.5	50.2
Female	76,064,000	65,607,683	15.9	50.5	49.8
Sex ratio	98.1	100.7	—	—	—

compared with 14.5% for the total population.

The urban trend from 1790 to 1950 is shown graphically in the accompanying chart (fig. 3), which not only indicates the rapid increase in the relative importance of the urban population from 1860 to 1930, but also shows effectively that for the major part of the nation's history it has been dominantly rural. Incidentally, this chart also helps visualize the increase in total population over 160 years.

Large Cities.—Table V gives the population of the 18 cities which had more than 500,000 inhabitants in 1950, with comparable figures for 1940. Only five of these cities showed a percentage increase above that of the United States as a whole, the largest absolute increase, amounting to nearly 500,000, being made in Los Angeles.

Racial Composition.—The population of the United States in 1950 comprised 135,215,000 white persons, 14,894,000 Negroes and 588,000 persons of other races, mainly Indians, Chinese, Japanese and Filipinos. The white population thus represented 89.7% of the total and the Negro population, 9.9%, leaving for the minor races (*i.e.*, those of minor statistical importance) only 0.4%. The percentage Negro had declined steadily from 1790, when it was 19.3, to 1890, when it had reached 11.9; from 1890 to 1930 there was a slower decline to 9.7 on the latter date, followed by slight, but hardly significant increases in the two following decades, to 9.8 in 1940 to 9.9 in 1950. The percentage white, of course, increased as a result of the decline in the proportion Negro, since the total of the "minor" races had never exceeded 0.5%.

The population of the United States included, in 1950, only 10,147,000 foreign-born white, as compared with 11,419,138 in 1940. There was thus an actual decrease of 11.1% in this class, which may be compared with an increase of 17.1% in the native white population. The distribution of the population of the United States by colour and nativity is shown for 1950 and 1940 in Table VI.

There were significant changes in the geographic distribution of the Negro population, especially after 1910, resulting from an extensive migration of southern Negroes to northern (and western) industrial centres. The percentage of Negroes of the population of the middle Atlantic states, for example, increased from 2.2 in 1910 to 4.6 in 1940, and in the east north central division, from 1.6 in 1910 to 4.0 in 1940. In the state of Michigan, taken alone, the increase was even more rapid, from 0.6% in 1910 to 4.0% in 1940, and 7.0% in 1950. Of the total population of Illinois in 1950, 7.3% was Negro, as compared with 4.8% in 1940, and 1.9% in 1910. Similar increases occurred in other industrial states and even greater relative increases in some important industrial cities.

The number of American Indians returned in the census year 1940 was 333,969 or practically the same number as in 1930. These figures may be compared with 265,683 in 1910, the last census prior to 1930 in which special effort was made to secure complete enumeration of all persons having any considerable proportion of Indian blood. The number of persons returned as full-blood Indians in 1930 (153,933), however, was only slightly larger than the 150,053 returned in 1910. These figures would indicate that most of the increase had been in persons of mixed Indian blood. Because of the difficulty of identifying these latter or of establishing the dividing point at which such persons should be counted as Indians, it was difficult to get thoroughly dependable counts of the Indian population, especially in those states where the Indian population had become largely intermingled with the white.

Foreign White Stock.—Under the classification "foreign white stock" the bureau of the census includes foreign-born white persons and persons with one or both parents foreign-born. In 1940 this classification included slightly more than one-fourth of the population, the number having decreased from 39,845,798 (or 32.5% of the total) in 1930, to 34,576,718, or 26.4% of the total in 1940. The foreign white stock in 1940 comprised 11,419,138 foreign-born white and 23,157,580 natives of foreign or mixed parentage; the latter, in turn, comprised 15,183,740 with both parents foreign-born; 5,267,140 with father foreign-born and mother native, and 2,706,700 with mother foreign-born and father native. It may be noted that all of these figures are smaller than corresponding figures for 1930. The distribution of the foreign white stock in 1940 by country of origin is shown in Table VII.

TABLE VII.—*Foreign White Stock by Country of Origin: 1940*

Country of origin	Total	Foreign-born	Native of foreign or mixed parentage			
			Total	Both parents foreign	Father foreign-born	Mother foreign-born
All countries	34,576,718	11,419,138	23,157,580	15,183,740	5,267,140	2,706,700

Russia (U.S.S.R.)	2,610,244	1,040,884	1,569,360	1,255,300	221,280	92,780
Lithuania	394,811	165,771	229,040	197,740	24,580	6,720
Finland	284,290	117,210	167,080	132,080	22,300	12,700
Rumania	247,700	115,940	131,760	103,060	20,340	8,360
Greece	326,672	163,252	163,420	122,580	39,280	1,560
Italy	4,504,780	1,623,580	2,971,200	2,348,380	533,060	89,760
Other Europe	392,647	165,987	226,660	162,380	51,840	12,440
America						
Canada	2,957,160	1,065,480	1,891,680	723,520	627,020	541,140
Mexico	1,076,653	377,433	699,220	452,760	159,320	87,140
All other	770,301	275,481	494,820	296,360	134,520	63,940

In terms of contribution to the total foreign white stock, Germany ranked first, with 5,236,612, or 15.1% of the total, and Italy second, with 4,594,780, or 13.3% of the total. It may be noted, however, that the number of Germans of the second generation was more than three times the number of German-born, while the number of second-generation Italians was less than twice the number of the first generation. Other comparisons of this kind can be made by referring to the detailed figures in the table.

Since less than 1% of the Negroes are foreign-born, and since the other racial groups constitute a very small fraction of the total population of the United States, the foreign white stock may be considered to represent practically the whole foreign element in the population of the United States.

In the matter of geographic distribution, it may be noted that both the foreign-born and the children of the foreign-born are found mainly in the northern and western states, there being relatively few in any of the states south of Maryland except in Florida and Texas.

The highest percentages of foreign-born white were found in 1940 in New York, with 21.2%; Massachusetts, Rhode Island and Connecticut each with more than 19% and New Jersey with 16.7%.

In the early stages of large-scale immigration to the United States, a large proportion of the immigrants settled on the new farmland which was being opened up in the west, but after about 1890 when the supply of free land (or land nearly free) was practically exhausted, there was an increasing tendency for the foreign-born to settle in the industrial cities.

Thus, we find that while only 8.8% of the total population in 1940 was foreign-born, this class represented 12.5% of the urban population, 5.1% of the rural-nonfarm and only 3.1% of the rural farm.

With the disappearance of the frontier land, agitation for restriction of immigration began to appear. The newer immigrants created lasting problems of assimilation and housing and their competition with the native labourer was more keenly felt now that the latter had no frontier to which to escape. The problem became more acute after World War I, when the United States, faced with the problem of reabsorbing its own war veterans into normal industrial life, realized that some barrier should be erected to restrict immigration from Europe.

Immigration increased from 141,132 in the year ending June 30, 1919, to 805,228 in 1921. Following somewhat lower figures in 1922 and 1923, immigration rose again in 1924 to 706,896. In this year the Immigration act of 1924 went into effect, with the result that in 1925 only 294,314 immigrant aliens were admitted to the United States. Admissions in the next few years were around 300,000, but further restrictions imposed as a result of the economic depression materially reduced the number admitted, so that the total for the decade ending in 1940 was only 528,431; and if from this figure be subtracted the number of emigrant aliens departing the net immigration for the decade would be only 68,693. Immigration remained at a low figure until 1946, in which year 108,721 immigrant aliens were admitted (net, 90,578); this figure increased gradually to 249,187 in 1950 (net, 221,589). Further information with regard to the general trend of immigration is given in the last column of Table I.

Sex Distribution.—The population of the United States in 1950, as shown in Table VI, comprised 74,633,000 males and 76,064,000 females, or 98.1 males per 100 females, as compared with 100.7 in 1940 and a maximum of 106.0 in 1910, which represented an excess of 2,692,288 males. The excess of males had been reduced in 1940 to 453,909, and as the change in the sex ratio continued, the number of females passed the number of males around the middle of 1944, and by 1950 the excess of females, on the basis of the 1950 census count, amounted to 1,431,000.

In interpreting this figure, however, one should bear in mind the fact that in 1950 several hundred thousand males were in military service outside the United States and therefore not counted in the census.

Age.—The median age of the population of the United States —that is, the age which divides the population into two equal groups, one younger and the other older—showed an increase each decade from 1820, when it was 16.7 years, to 1950, when it was 30.1 years, the median ages for 1930 and 1940 being 26.5 years and 29.0 years respectively. The increase was chiefly the result of two causes: first, an increase in the average length of life; and second, a reduction in the birth rate which resulted in a decrease in the proportion of young persons in the population. Immigration also tended to raise the median age since most immigrants were above 20 years of age. The median age of the foreign-born white population in 1940 was 51.0 years, as compared with 26.9 years for the native white and 25.3 for the Negro population.

The age distribution of the population is shown for 1950 and 1940 in Table VIII.

TABLE VIII.—*Population of the United States by Age*
(Figures for 1950 are based on the tabulation of a small sample)

Age	1950	1940	Per cent of increase	Per cent distribution	
				1950	1940
All ages	150,697,000	131,669,275	14.5	100.0	100.0
Less than 5 years	16,324,000	10,541,524	54.9	10.8	8.0
5 to 9 years	13,241,000	10,684,622	23.9	8.8	8.1
10 to 14 years	11,361,000	11,745,935	−3.3	7.5	8.9
15 to 19 years	10,732,000	12,333,523	−13.0	7.1	9.4
20 to 24 years	11,327,000	11,587,835	−2.3	7.5	8.8
25 to 29 years	12,093,000	11,096,638	9.0	8.0	8.4
30 to 34 years	11,601,000	10,242,388	13.3	7.7	7.8
35 to 39 years	11,103,000	9,545,377	17.3	7.4	7.2
40 to 44 years	10,058,000	8,787,843	14.5	6.7	6.7
45 to 49 years	8,990,000	8,255,225	8.9	6.0	6.3
50 to 54 years	8,274,000	7,256,846	14.0	5.5	5.5
55 to 59 years	7,230,000	5,843,865	23.7	4.8	4.4
60 to 64 years	5,950,000	4 728,340	25.8	3.9	3.6
65 to 69 years	5,060,000	3,806,657	32.9	3.4	2.9
70 to 74 years	3,425,000	2,569,532	33.3	2.3	2.0
75 years and over	3,837,000	2,643,125	45.2	2.5	2.0
Median age, years	30.1	29.0	—	—	—

The most striking feature indicated by the figures in Table VIII is the great increase in the population under 5 years of age—an obvious result of the greatly increased numbers of births between 1945 and 1950, to which reference has already been made. Against an increase of 14.5% in the total population, the population under 5 years of age increased by 54.9%, while the numbers of persons in the three 5-year groups representing persons from 10 to 24 years of age (those born during the extremely low birth-rate years) were actually smaller in 1950 than in 1940. While the population under 5 years of age formed 10.8% of the total in 1950, as compared with 8.0% in 1940, the population 15 to 19 years of age represented only 7.1% of the total in 1950, as compared with 9.4% in 1940.

At the other end of the age scale, persons 65 years old and over continued to show more rapid increase than those in any other age group except the youngest, and to increase their percentage of the total population, persons 65 years old and over representing 8.2% of the total in 1950, as compared with 6.9% in 1940.

Education.—Up to 1930 the census figures which offered the best index of educational attainment were based on a question with respect to literacy, though the figures shown in the census tables were usually the number or percentages of illiterates, that is, persons not able to read and write. The percentage of illiteracy in the total population decreased rather rapidly from 20.0 in 1870 to 6.0 in 1920 and 4.3 in 1930. On the latter date the percentage illiterate in the native white population was only 1.5, and when classified by age, it appeared that practically all of these illiterates were in the older age groups.

Partly because there seemed to be little room for further improvement in literacy in the major classes of the population, and partly to provide a classification more definite and tangible than the question on ability to read and write, a question on the number of years of schooling was substituted in 1940 for the traditional question on literacy. The results of this new inquiry, with respect to persons 25 years old and over, are presented in Table IX. This age group was selected as comprising, for the most part, persons whose formal education had been completed, since many

of the persons under 25 years of age would be still in school and thus still in process of adding to their educational attainment.

Of the total population 25 years old and over in 1940, 4.6% had completed college, 14.1% had completed high school only, and 34.6% had completed grade school only; while 13.5% had completed less than 5 years of formal school attendance.

The median number of years of school completed for the total population was 8.4. For the native white population alone, the median was 8.8, as compared with 7.3 for the foreign-born white, and 5.7 for the Negro population. A word of caution should be given with regard to the relation between these medians, which are expressed in tenths, and the basic classifications which are expressed in full years. The median point for the total population is located at about the middle of the 8-year group, representing theoretically persons who have had 8.4 years in school, while the entire 8-year group includes also those who have had from 8.5 to 8.9 years (but less than 9 years). Note that these medians are purely theoretical index numbers, like the median size of family, for example, since the returns for school years completed are in full years and not in months or fractions. (L. E. T.)

TABLE IX.—*Persons 25 Years Old and Over by Years of School Completed: 1940*

Years of school completed	Total number	Per cent distribution				
		Total	Native white	Foreign-born white	Negro	Other races
Persons 25 years old or over	74,775,836	100.0	100.0	100.0	100.0	100.0
No school years completed	2,799,923	3.7	1.3	12.2	10.0	18.8
Grade school: 1 to 4 years	7,304,689	9.7	6.1	16.1	31.3	17.1
5 and 6 years	8,515,111	11.4	9.7	14.3	21.5	14.0
7 and 8 years	25,897,953	34.6	36.0	36.4	19.8	22.6
High school: 1 to 3 years	11,181,995	15.0	17.3	6.9	8.5	10.1
4 years	10,551,680	14.1	16.6	7.4	4.1	9.8
College: 1 to 3 years	4,075,184	5.4	6.6	1.9	1.8	2.9
4 years or more	3,407,331	4.6	5.4	2.3	1.2	2.4
Not reported	1,041,970	1.4	1.1	2.5	1.8	2.4
Median school years completed	8.4	8.4	8.8	7.3	5.7	6.8
Per cent less than 5 years completed	13.5	13.5	7.4	28.3	41.3	35.9

Religious Bodies.—While the following statistics of membership may be used in a very general way for comparison of denominational strength, it must be remembered that membership is counted very differently in different denominations, the membership of children especially differing between Roman Catholic and most Protestant bodies. The Church of Christ, Scientist, is not included because the manual of that body forbids the numbering of the people and the reporting of such statistics for publication.

According to the census of religious bodies taken by the United States bureau of the census in the year 1936 there were in the United States 256 religious denominations, represented by 199,302 organizations with 55,807,366 members.

By 1950, total church membership was estimated at 81,862,328 persons, according to the *Christian Herald*. Membership had been increasing for many years and this was the highest proportion of the total population ever reported—more than one out of two. Of this total, 50 larger denominations of more than 50,000 members each represented 97.2% of all church membership in the continental United States. The remaining members, less than 3%, were in more than 200 bodies. Of the total church membership, 57.3% was Protestant, 32.6% Roman Catholic, 6.1% Jewish and 1.2% Greek Orthodox, Russian Orthodox, Armenian Orthodox and Polish National Catholic. Though Protestants as a group outnumbered Roman Catholics almost two to one, the Roman Catholic Church was far ahead of any other single denomination.

According to the 1936 federal census, the Roman Catholic was the leading denomination in membership in every one of the northern and western states, except in Idaho and Utah, where the Latter-Day Saints (Mormons) predominated by a large margin. In the southern states the leading denominations were either Baptist or Methodist. The Lutherans were relatively strongest in the north-central division of the country, their members consisting chiefly of Germans and Scandinavians. The other important Protestant bodies were widely and fairly evenly distributed over the country. Jewish congregations were most important in New York, Pennsylvania, Illinois, Massachusetts and New Jersey.

The immigration from southeastern Europe gave great strength to some sects which had no existence in the religious census of 1890, notably those of the Eastern Orthodox Churches (Russian, Serbian, Syrian and Greek). (X.)

Employment Status.—One of the most important characteristics of any population is its relation to employment, with the various possible classifications by occupation, industry, etc. Of the total population of the United States 14 years old and over in 1950, which amounted to 111,915,000, 58,735,000, or 52.5%, were in the civilian labour force. Of this number, 55,843,000, or 95.1%, were employed, and 2,892,000, or 4.9%, were unemployed. The percentage of males 14 years old and over in the civilian labour force was 77.3 (supplemented by an additional 1.5% in military service), while the corresponding percentage for females was 28.6, the major part of the women not in the labour force being engaged in caring for their own homes. These figures are summarized, with percentages for the four main geographic regions into which the country is divided, in Table X.

TABLE X.—*Employment Status of the Population 14 Years Old and Over, By Regions, By Sex: 1950*
(For composition of regions, see Table III. Figures for 1950 are based on the tabulation of a small sample)

Sex and employment status	Total number	Per cent distribution				
		U.S. total	North-east	North central	South	West
Total, 14 and over	111,915,000	100.0	100.0	100.0	100.0	100.0
Total labour force	59,592,000	53.2	53.6	53.7	52.3	53.6
Civilian labour force	58,735,000	52.5	52.8	53.4	51.4	52.2
Employed	55,843,000	49.9	49.6	51.4	49.3	48.4
Unemployed	2,892,000	2.6	3.2	2.1	2.0	3.8
Not in labour force	52,323,000	46.8	46.4	46.3	47.7	46.4
Male, 14 and over	54,923,000	100.0	100.0	100.0	100.0	100.0
Total labour force	43,268,000	78.8	78.1	80.3	78.3	77.7
Civilian labour force	42,446,000	77.3	76.5	79.8	76.4	75.0
Employed	40,317,000	73.4	71.5	76.7	73.6	69.6
Unemployed	2,129,000	3.9	5.1	3.1	2.9	5.4
Not in labour force	11,655,000	21.2	21.9	19.7	21.7	22.3
Female, 14 and over	56,991,000	100.0	100.0	100.0	100.0	100.0
Total labour force	16,323,000	28.6	30.5	28.0	27.2	29.6
Civilian labour force	16,289,000	28.6	30.5	27.9	27.1	29.5
Employed	15,526,000	27.2	29.1	26.9	25.8	27.4
Unemployed	763,000	1.3	1.4	1.0	1.3	2.1
Not in labour force	40,668,000	71.4	69.5	72.0	72.8	70.4

Since there is a definite relation between age and labour force participation, there is presented in Table XI a brief summary for the population, male and female, classified by age.

TABLE XI.—*Employment Status of the Population 14 Years Old and Over, By Age and Sex: 1950*
(Figures for 1950 are based on the tabulation of a small sample)

Age	Population 14 years old and over		Per cent in civilian labour force		Per cent of labour force employed	
	Male	Female	Male	Female	Male	Female
Total	8,554,000	7,662,000	83.2	16.4	98.4	97.4
14–19 yrs.	1,432,000	1,243,000	49.4	15.0	98.0	92.4
20–24 yrs.	787,000	694,000	91.9	21.3	95.7	95.9
25–34 yrs.	1,372,000	1,374,000	97.0	18.5	98.2	98.0
35–44 yrs.	1,533,000	1,434,000	96.5	21.4	99.0	99.3
45–54 yrs.	1,322,000	1,233,000	94.6	17.4	99.1	97.7
55–64 yrs.	1,127,000	912,000	88.6	11.5	97.9	99.0
65 yrs. and over	981,000	772,000	63.6	5.2	—	—

It may be noted that from ages 25 to 54 years nearly the whole male population was in the civilian labour force—with considerable additional numbers, especially of those just above 20 years of age, in military service. In the female population the maximum labour force participation was in the age groups 20 to 24 years and 35 to 44 years, the intervening group containing many married women with young children.

Another factor affecting labour force participation, especially for women, is marital status. A brief summary of the available data, classified in accordance with this factor, is presented in Table XII.

In accordance with these figures, 9,273,000 married women

TABLE XII.—*Labour Force Status of the Civilian Population 14 Years Old and Over, By Sex and Marital Status: 1950*
(Figures are based on a small sample survey)

Sex and marital status	Civilian population 14 and over	In labour force		Employed	
		Number	Per cent of pop.	Number	Per cent of labour force
Male	54,287,000	44,426,000	81.8	41,424,000	93.2
Single	14,212,000	8,898,000	62.6	7,710,000	86.6
Married, wife present	35,925,000	32,912,000	91.6	31,409,000	95.4
Married, wife absent	1,096,000	817,000	74.5	2,305,000	88.1
Widowed or divorced	3,053,000	1,799,000	58.9		
Female	56,635,000	17,795,000	31.4	16,674,000	93.7
Single	11,126,000	5,621,000	50.5	5,272,000	93.8
Married, husband present	35,925,000	8,550,000	23.8	8,038,000	94.0
Married, husband absent	1,526,000	723,000	47.4	3,364,000	92.8
Widowed or divorced	8,058,000	2,901,000	36.0		

were in the labour force in 1950, as compared with 5,621,000 single women. This represents a material change in the extent of employment of married women, even as compared with 1940, when the number of married women in the labour force was only 4,560,835, as compared with 6,349,474 single women. Between 1940 and 1950, to be sure, the percentage of all women who were married had increased materially, but the increase in labour force participation on the part of married women was far greater.

Another fundamentally important classification of the labour force is that based on the industry in which employed. A brief summary of this distribution for employed workers in 1950 is presented in Table XIII, with percentages for the four regions as well as for the United States.

The largest single group in the series presented in this table is that designated "manufacturing," which gave employment to 25.3% of the whole number of employed workers in the United States as a whole, and an even larger percentage in the northeast and north central regions; the widest variation among the regions in the matter of industrial classification was that with respect to agriculture. In the country as a whole, 12.8% of the workers were in agriculture. In the northeast, however, only 3.8% were in this industry, as compared with 20.6% in the south and 14.5% in the north central region. All of these figures represent a marked decline (in the relative importance of agriculture, as measured by employment) from 1940, when corresponding percentages were as follows: 18.7 for the United States, 4.7 for the northeast, 19.5 for the north central region, 38.2 for the south and 15.9 for the west. This decline was largely the result of increased use of farm machinery and improvement in production methods.

Family Income.—A new inquiry on the 1950 census schedule was one relating to income—total income, as compared with wage or salary income alone, which was collected in 1940. A summary of the tabulation of family income, that is, of families classified by income, is presented in Table XIV.

A family, it may be noted, is defined for this purpose as a group of two or more related persons living in the same household or otherwise sharing the same accommodations. These figures, like those in the preceding table, are shown for the four regions, among which there are many significant differences. The median income of the 36,441,000 families for which data were obtained was $3,068. The regional medians ranged from $3,435 in the west and $3,362 in the northeast to $2,248 in the south. The largest single group for the United States as a whole was the 3,989,000 families with income of $3,000 to $3,499, which formed 10.9% of the whole number of families. This same group included the largest number of families in all of the regions except the south, where the numbers of families in each of the four groups with incomes of less than $2,000 exceeded the numbers of families in any other income group.

Size of Household.—In 1850 there were 5.6 persons in the average U.S. family or household. In 1890 the average population per family was 4.9; in 1900, 4.7; in 1910, 4.5; in 1920, 4.3; and in 1940, 3.8; these figures were obtained, in all cases, by dividing the total population by the number of families or households. In 1950 the average population per household or occupied dwelling unit was 3.5. The unusually large numbers of marriages in the decade ending in 1950 had obviously tended to increase the number of households, while the large numbers of births, being for the most part first or second births, had not accumulated to an extent sufficient to affect the average size of family or household.

Tenure of Home.—The whole number of occupied dwelling units or homes in the United States in 1950 was 42,520,000, this being the same as the number of households. Of these homes, 23,383,000, or 55.0%, were occupied by owners, while 19,136,000, or 45.0%, were occupied by tenants or renters. Of the whole number of homes, 61.4% were single-family detached houses. In the rural-farm area, 95.1% of the homes were of this type; in the rural-nonfarm area, 81.9%; and in the urban area, 48.2%. Conversely, 10.0% of the urban homes were in structures containing 10 dwelling units or more, as compared with 0.5% in the rural-nonfarm areas, and practically none at all on the farms. For the country as a whole, 6.7% of the homes were in these multifamily structures.

TABLE XIV.—*Families in the United States By Income, By Regions: 1949*
(Figures for 1950 are based on the tabulation of a small sample)

Income level	Total number	Per cent distribution				
		U.S. total	Northeast	North central	South	West
Families reporting	36,441,000	100.0	100.0	100.0	100.0	100.0
Less than $500	3,129,000	8.6	7.0	7.0	12.4	6.3
$500–$999	2,496,000	6.8	3.6	5.4	12.0	4.5
$1,000–$1,499	2,664,000	7.3	4.9	6.5	10.8	5.7
$1,500–$1,999	2,717,000	7.5	5.8	6.5	10.0	6.9
$2,000–$2,499	3,378,000	9.3	9.2	9.0	9.9	8.5
$2,500–$2,999	3,292,000	9.0	10.1	9.6	8.0	8.1
$3,000–$3,499	3,989,000	10.9	12.9	11.5	8.6	11.6
$3,500–$3,999	3,179,000	8.7	9.4	10.0	6.1	10.6
$4,000–$4,499	2,620,000	7.2	8.5	7.8	4.9	8.6
$4,500–$4,999	1,786,000	4.9	5.2	5.5	3.7	5.8
$5,000–$5,999	2,864,000	7.9	9.0	8.8	5.3	9.4
$6,000–$6,999	1,557,000	4.3	5.0	4.6	3.0	5.3
$7,000–$9,999	1,714,000	4.7	5.6	5.0	3.3	5.5
More than $10,000	1,054,000	2.9	3.8	2.8	2.0	3.4
Median income	$3,068	$3,068	$3,362	$3,257	$2,248	$3,435

Of the owner-occupied homes, taken alone, 81.4% were single-family houses, as compared with 37.1% of the renter-occupied homes. These figures are presented in detail for urban and rural areas in Table XV.

Homes by Number of Rooms.—The median number of rooms in the occupied dwelling units in 1950 was 4.7, being 5.3 in the owner-occupied units and 3.8 in the renter-occupied units. These figures are summarized in Table XVI, from which it may be noted, in particular, that the 1-room, 2-room and 3-room

TABLE XIII.—*Employed Workers By Major Industry Groups, By Regions: 1950*
(Figures for 1950 are based on the tabulation of a small sample)

dwelling units represented a much larger fraction of the whole number of tenant homes than of owned homes. This is explained in part by the fact that dwelling units in apartment houses, which are practically all rented, are likely to be smaller, that is, to have fewer rooms, than the single-family detached houses.

Toilet Facilities.—An important current index of the quality of housing is the presence or absence of bathing and toilet facilities. Of the urban homes reporting in 1950, 86.9% had a flush toilet inside the structure for the exclusive use of the household; in the rural-nonfarm area, 55.6% of the homes were thus equipped, as compared with only 28.8% of the rural-farm homes. Of the owner-occupied urban homes, 91.8% were provided with flush toilets, as compared with 82.0% of the renter-occupied homes.

TABLE XV.—*Occupied Dwelling Units By Tenure and Type of Structure: 1950*
(Figures for 1950 are based on the tabulation of a small sample)

9 rooms or more	1,433,000	3.4	1,169,000	5.1	264,000	1.4
Median number of rooms	4.7	—	5.3	—	3.8	—

Similar differences appeared in the other areas for which data are available. These figures are presented, with additional details, in Table XVII.

Value or Rent.—Occupied homes in urban and rural-nonfarm areas combined (omitting farm homes, since it is difficult to obtain a separate value for the home on a farm), are classified in Table XVIII by value or rent. The median value of the owner-occupied homes was $7,400. More than half of the whole number of homes were in three groups ranging in value from $6,000 to $14,999, while only 7.7% represented homes valued at less than $2,000. The median monthly rental of the tenant-occupied homes was $35. Considerably more than half the whole number of these homes carried rentals ranging from $30 to $49, and for only 4.4% was the rental less than $10.

Many of the items briefly presented above, including, for example, the figures on income, plumbing equipment in the homes and amount of rent paid, tend to support the assumption that the standard of living of the American people is relatively high. The low and decreasing percentage of the working population engaged in agriculture, and the increasing percentages engaged in manufacturing, distribution and service activities (all evidences of further industrialization) indicate some of the reasons for the improving standards. And the increases in the rate of population growth doubtless represented in part the indirect result of this improved economic status.

VI. NATIONAL FINANCES

Establishment of the Financial System.—Under the Articles of Confederation, the federal government had been empowered to borrow and make requisitions on the states, but not to tax. Thus, it was largely dependent upon the states, which levied all taxes. In the first two years of the confederation, congress asked for $10,600,000; the states responded with less than $1,600,000. During the entire period of the confederation, 1781–89, the federal government obtained barely enough funds to meet current expenses, and not enough to meet interest requirements on the continuously rising debt. The national finances finally broke down completely in 1786. Further borrowing had become virtually impossible and requisitions yielded practically nothing. This collapse, caused by the financial impotence of the government, was the immediate reason for the call in 1787 for a constitutional convention.

The new constitution, which came into effect in 1789, gave the federal government power to lay and collect taxes, duties, imposts and excises; to borrow money, pay debts, coin money and regulate its value. The states, on the other hand, were deprived of the right to coin money, emit bills of credit, make anything but gold and silver legal tender in payment of debts or to lay any duties on imports or exports. Federal expenditures were restricted to appropriations made by congress. These new financial powers of the federal government were implemented by the grant to congress of powers to provide for calling out the militia to execute the laws of the union, and by the provisions making the judicial power of the federal government coextensive with its legislative power.

The treasury department, with a single head instead of a proposed commission, was created. Alexander Hamilton (*q.v.*) was appointed secretary. Revenue was obtained through somewhat protective customs duties and tonnage duties, excises and the sale of public lands. Provision was also made for the public debt. In addition to gifts of nearly $2,000,000 from the French and Spanish treasuries, the United States had borrowed about $11,800,000 (including arrears of interest) in France, Holland and Spain. In addition, the domestic debt of the federal government, consisting of a great variety of obligations, was estimated by Hamilton in 1790 at $42,400,000, exclusive of the continental currency. Finally, the individual states, in the prosecution of the war, had contracted debts of various descriptions, aggregating approximately $18,300,000. Under the Funding act of Aug. 4, 1790, all of the foregoing indebtedness was converted into new federal loans. Despite the great previous depreciation in value of nearly all the obligations, they were all paid off at par and accrued interest in new bonds, with the single exception of the continental bills of credit. About $6,000,000 of this continental currency, of which about $78,000,000 was estimated to be outstanding, was funded into the new debt at the rate of 100 to 1; the remainder was not presented. This exceptional treatment was justified on the ground that the continental bills had long since ceased to circulate as currency; and as far back as 1781 had been bought and sold by speculators at rates ranging from 500 to 1,000 to 1.

The final step necessary for a stable financial system was the establishment of a uniform currency system. The Mint act of April 2, 1792, provided for a bimetallic monetary system, based upon a dollar consisting of 24¾ grains of pure gold or 371¼ grains of pure silver, a ratio of 1 to 15. The act provided for the unlimited and gratuitous coinage by the mint, to be established in Philadelphia, Pa., of both metals, at the option of any holder.

NATIONAL FINANCES 1792–1913

Until the Civil War, customs duties constituted the main source of revenue of the federal government. The few internal revenue taxes that had been intermittently in force were largely abolished in 1817. Sales of public lands yielded varying amounts annually, ranging, after 1800, from $168,000 in 1801 to $25,000,000 in 1836. The national debt was extinguished in 1835—though the depression following the panic of 1837 and the Mexican War quickly created a new debt. The Civil War, disrupting the economic as well as the political life of the nation, and waged relentlessly for four long years, created serious fiscal problems. The treasury was forced to suspend specie redemption of its legal tender notes (greenbacks), which, issued in the amount of $449,000,000 during the war, depreciated severely in terms of gold, this depreciation amounting to as much as 61% at one time. Despite the introduction of a series of highly productive internal revenue taxes, heavy annual deficits were incurred. The interest-bearing public debt rose from approximately $65,000,000 in 1860 to $2,322,000,000 in 1866. On June 30, 1860, the government's gross debt was only $2.06 per capita; by June 30, 1866, it had risen to $77.69 per capita—a figure not reached again until World War I. The National Banking act of 1863, which authorized the establishment of national banks and the issue by such banks of circulating notes secured by United States bonds, helped to provide a market for the Civil War bond issues. Financial recovery was swift in the years following the Civil War. Although most of the wartime taxes were quite promptly repealed, the growing customs receipts resulted in a long series of uninterrupted budget surpluses (1866–93). The treasury resumed specie payments in 1879; and the interest-bearing public debt was continuously reduced, falling below $1,000,000,000 by 1888.

Well before the resumption of specie payments monetary controversies had arisen. The original gold-silver mint ratio of 15 to 1, set in 1792, had closely approximated the actual market ratio. Very soon thereafter, however, a decline in the market value of silver tended to send gold coins out of circulation and out of the country. After several years of discussion, congress in 1834 reduced the content of the gold dollar and in 1837 raised it slightly, without changing the weight of the silver dollar. The resulting ratios, 16.002 and 15.988 to 1, both overvalued gold rather decidedly. Silver dollars were melted and sold as bullion. Following discoveries of gold in California and Australia in 1848 and 1849, the value of silver rose so much in terms of gold that congress in 1853 had to reduce the bullion content of fractional silver coins to prevent their being melted and sold as bullion. In revising the list of coins to be struck by the mint, preparatory to the resumption of specie payments, congress in 1873 eliminated the silver dollar. This attracted little notice at the time because no silver dollars had been coined for many years. Soon afterward, the discovery of new silver supplies in the United States and the demonetization of silver by several European countries caused a decline in the market price of silver. A strong movement arose in the United States for the resumption of unlimited coinage of silver dollars. Many supporters of this movement hoped thereby to check the current decline in general commodity prices. Partial concessions to this movement were made by congress in 1878 and in 1890 when the Bland-Allison and the Sherman Silver Purchase acts, respectively, were passed. Under the former, the secretary of the treasury was directed to purchase $2,000,000 to $4,000,000 of silver bullion at market prices each month, and to issue therefor legal tender silver dollar coins, or silver certificates representing the deposit of such coins in the treasury. This act was succeeded by the Sherman act, whereunder the secretary of the treasury was directed to purchase 4,500,000 oz. of silver bullion per month and to pay therefor in legal tender treasury notes redeemable in either gold or silver, at his option. Neither of these acts provided for the unlimited coinage of silver and, therefore, left the monetary system on an essentially monometallic gold base. The Sherman act was repealed in 1893, after the treasury's gold reserve had been greatly reduced by the repeated redemption of the Sherman notes in gold. The outstanding public question during the presidential campaign preceding the election of 1896 was

whether the United States should re-establish a bimetallic monetary system on the basis of both gold and silver, or maintain a single gold standard. Following Pres. William McKinley's election, the silver movement lost much of its impetus, mainly because the increasing output of the South African gold mines and the expanding volume of credit provided by the banking system made possible a period of rising prices. In the Gold Standard act of 1900, the monetary standard of the United States was formally declared to consist of 25.8 grains of gold nine-tenths fine; and the secretary of the treasury was directed to maintain all forms of money of the United States at par.

NATIONAL FINANCES 1913–30

Taxation.—A notable development in the federal revenue structure after 1913 was the adoption and entrenchment of direct taxes, levied at progressive rates, as the basic source of public revenues. The 16th amendment, authorizing the federal government to "lay and collect taxes on incomes from whatever source derived" was ratified in 1913, and was utilized almost immediately in the Tariff act of Oct. 3 of that year. The entrance of the United States into World War I quickly caused income taxation, supplemented for a time by excess-profits taxes, to take preeminent rank in the revenue system. In 1910, more than 96% of the total internal revenue and customs receipts of the federal government was derived from customs duties and excise taxes on tobacco and alcoholic beverages; in 1920, 69%, and in 1930, 66.5%, was derived from income and profits taxes. The principle of progressive taxation was also applied to estates, beginning with the Revenue act of 1916.

World War I transformed the importance of federal revenues and expenditures in the economic life of the country. Prior to 1917, the total ordinary expenditures of the federal government had exceeded $1,000,000,000 only once. During the next six years, in contrast, total ordinary expenditures aggregated more than $48,000,000,000. Similarly, prior to 1917, total ordinary receipts had never reached $1,000,000,000; but during the next six years they aggregated more than $26,000,000,000. Under the Revenue act of 1918, the rates of tax on individual incomes of the year 1918 started at 6%, after an exemption of $1,000 for a single person, $2,000 for a married person and $200 for each dependent, and rose to 77% (65% surtax) on net incomes of more than $1,000,000. The taxes on corporations included one-tenth of 1% on their capital stock in excess of $5,000, 12% on their net incomes, and combined war profits and excess-profits taxes ranging up to 80% of profits in excess of certain credits, for the taxable year 1918. Many new taxes were imposed on commodities and business transactions.

Public Debt.—The enormous increase in taxation in 1917–20, while unprecedented in the previous history of the country, did not provide revenues sufficient to pay even one-half of the immediate financial cost of World War I, inclusive of loans to foreign governments. The deficit financing made necessary by the prodigious financial costs of the war was conducted with remarkable facility. The federal reserve system, which had been placed in operation in Nov. 1914, played a valuable role in this connection. Bank loans secured by the government obligations were made eligible for rediscount by the federal reserve banks; and this fact enormously increased the disposition and ability of the U.S. public to purchase the government's obligations. The treasury's principal practice was to obtain funds initially through the issue of short-term certificates of indebtedness, which were sold mainly to banks, and subsequently to fund these loans into large popular bond issues. The five such War Loans issued during the war and post-Armistice periods raised an aggregate sum of approximately $21,000,000,000; and the number of separate subscriptions ranged from approximately 4,000,000 for the First Liberty Loan to nearly 22,800,000 for the Fourth Liberty Loan. Immediately after the war, congress provided for the systematic discharge of the public debt, which attained a peak of $26,594,267,878 on Aug. 31, 1919. The debt was reduced about $10,000,000,000 over the next ten years.

A series of drastic tax reductions also followed. After Pres. Warren G. Harding's inauguration, the excess-profits tax on corporations was repealed (this was partially offset by an increase in the corporation income tax), the rates on individual incomes were reduced and a number of excise taxes eliminated (Revenue act of 1921). In 1924, further reductions in individual income tax rates and excise duties were made. In 1926, sharp reductions were made in the income tax rates applicable to large individual incomes. The maximum surtax on individual incomes, which had previously been successively reduced from 65% to 50% and to 40%, was now fixed at only 20%.

The Budget.—An important fiscal development of this period was the inauguration of an executive budget, under an act of congress of June 10, 1921. A bureau of the budget was established to prepare the annual budget and such supplemental and deficiency estimates as the president might desire to recommend to congress. At first, the budget was largely an accounting document designed to secure economy in government. Under the stress of depression and war, however, the budget became the main instrument for the presentation of the president's views on the requirements of fiscal policy for the economic well-being of the nation.

Loans to Foreign Governments.—During and after World War I, the United States made loans aggregating more than $10,000,000,000 to foreign governments. About $7,000,000,000 of these loans were made to allied governments prior to the Armistice. The remainder were made after the Armistice for relief and reconstruction purposes. Despite funding agreements, the principal debtors sought to condition their payments on receiving reparations from Germany—a condition contrary to American policy and unacceptable to the United States. A World War Debt commission during the early 1920s was unable to produce a satisfactory compromise solution. Ultimately all debtor nations defaulted, in whole or in part, except Finland which continued payments until invaded by the Soviet Union in 1939. By 1954 the total World War I debt owing to the United States, with accrued interest, amounted to more than $17,000,000,000 and was generally regarded as uncollectible.

NATIONAL FINANCES 1930–39

National finances in the decade 1930–39 were influenced primarily by the world-wide depression. Unemployment plagued the country during the entire period despite vastly increased outlays for relief and related purposes. The Hoover administration sought domestically to halt the deflationary spiral by increased aids to farmers, national voluntary relief programs, public works and emergency credit institutions such as the Reconstruction Finance corporation and Home Loan banks. Efforts were made to stem the international financial panic by a moratorium on debt, standstill agreements and the 1933 World Economic conference.

Unlike the Hoover administration, which operated within the traditional monetary, fiscal and banking structure, the Roosevelt administration embarked on a many-faceted socioeconomic program including abandoning the gold standard, monetary devaluation, currency inflation, banking reform, an industrial recovery program, agricultural subsidization, public works and relief programs, social security and unemployment legislation involving a general expansion of federal expenditure financed in part by borrowing. As the depressed decade wore on, the deficit financing originally undertaken as an expedient developed into a more or less formal policy.

Greater outlays by the national government during the depression brought increased efforts to find new tax sources and to raise the rates of those already in use. Total federal tax receipts increased from about $3,600,000,000 in 1930 to $5,480,000,000 in 1939. Most of the increase was due to the imposition of new taxes rather than to increased rates on those previously levied.

In 1932 a gift tax, a large group of manufacturers' excise and other miscellaneous taxes were enacted. In 1933 the capital stock tax, the excess-profits tax and taxes on beer, and in 1934 the alcoholic beverage taxes were added. Rates of the estate and gift taxes were increased and exemptions were decreased.

Numerous changes were made in the income tax beginning in 1932. Personal exemptions were reduced. Rates of both indi-

vidual and corporation taxes were increased. The corporation tax was converted from a flat percentage to a graduated tax. The earned income credit, the deduction of capital losses and the carry-over of losses were restricted or eliminated but later restored in whole or part. Dividends were made subject to the personal normal tax even though they came from corporations that had paid corporation income taxes, and 15% of intercorporate dividends were made taxable. Corporations filing consolidated returns were for a while subject to an additional tax, and later the privilege of filing such returns was limited to railroad and street and interurban railway corporations. With a view to rendering the individual income tax more effective, special taxes were imposed on personal holding companies, and the tax on corporations accumulating surplus to avoid surtax on shareholders was strengthened. In 1936 a tax was imposed on undistributed profits, reduced in 1938 and eliminated in 1939. The compensations of the officers and employees of the states and their political subdivisions became taxable under the individual income tax in 1939.

Under the Social Security act of 1935 taxes were imposed on both employers and employees for old-age insurance and unemployment compensation purposes.

Public Debt.—Total federal debt outstanding increased sharply from $16,200,000,000 on June 30, 1930, to $45,900,000,000 on June 30, 1939. As shown in Table I, interest on the public debt did not increase in the same proportion. For the fiscal year 1930 interest on the public debt amounted to $659,000,000 and increased to $941,000,000 in 1939. Monetary developments, increased bank excess reserves and a decline in the volume of commercial loans and private debt made it possible for the treasury to refund callable and maturing bonds at substantially lower interest rates, thus reducing the average effective interest rate on the public debt. The emergence of fiscal policy during the decade as a significant factor in combatting depression together with the greatly increased debt, expressed both absolutely and relative to the national income, gave added significance and new attention to problems of debt management.

Monetary Developments.—The most significant financial events of the years 1930–39 were those relating to changes in the nation's monetary and banking structure. After the presidential election in 1932 a series of bank runs, publication of the names of banks securing RFC loans and a series of investigations and rumours, whether rightly or wrongly interpreted, shook public confidence in banks in general. By Feb. 1933 there were several state banking holidays and something resembling a currency panic on the part of the public. All banking operations were suspended by the newly inaugurated Roosevelt administration on March 6, 1933, and on March 9 congress passed the Emergency Banking act. Under its provisions the secretary of the treasury issued licences permitting banks to reopen in accordance with condition and location in such a way as to avoid a stigma on late openers. Within a month member banks of the federal reserve system representing 90% of total banking resources had reopened. The act also provided for a system of deposit insurance which later became the Federal Deposit Insurance corporation for the purpose of insuring deposits in commercial banks. All member banks were required to join while nonmember state banks might do so.

The Emergency Banking act also empowered the president to "nationalize" gold coins and gold bullion. In exercise of this power, executive orders were issued requiring all persons to surrender to the government their gold coin, gold bullion and gold certificates with a few minor exceptions for industrial users and numismatists. On May 12, 1933, the provisions of the so-called "inflation amendment" to the Agricultural Adjustment act provided for currency expansion in several ways: (1) the president was authorized to reduce the weight of the gold dollar up to 60%; (2) the treasury was authorized to issue up to $3,000,000,000 in unsecured paper money; (3) federal reserve banks were permitted to buy an additional $3,000,000,000 of treasury notes; (4) the president was authorized to accept, under certain conditions, a limited amount of foreign silver bullion at prices exceeding those prevailing in the market; (5) the president was given discretionary power to re-establish a bimetallic monetary standard; (6) all coins and currencies of the United States were declared to be full legal tender; (7) the federal reserve board was authorized to declare, with the approval of the president, a credit emergency and to increase or decrease member bank reserve balances. Later, by joint resolution, congress abrogated the gold clause in all public and private contracts, thus permitting all outstanding obligations to be paid in any legal tender currency.

Actual devaluation of the dollar took place over a period of time by raising the treasury buying price for gold from the old official rate of $20.67 an ounce to $35 an ounce on Jan. 16, 1934. The latter price reflects a statutory definition of the dollar of 15 5/21 gr. of gold, nine-tenths fine, compared with the previous definition of 25 8/10 gr., nine-tenths fine. The new dollar was fixed, therefore, at 59.06% of its former weight. The Gold Reserve act of Jan. 31, 1934, gave further explicit congressional authorization for the steps already taken and provided for a

$2,000,000,000 foreign exchange stabilization fund from the $2,811,000,000 "profit" resulting from the increased value of the gold held by the treasury. Ultimately, $1,800,000,000 of the stabilization fund was used to pay part of the United States' subscription to the International Monetary fund in July 1945. Other partly discretionary powers were given to the secretary of the treasury to purchase newly mined domestic silver by the Silver Purchase act of 1934. Such purchases were authorized to continue until the market price reached the statutory price of $1.2929 per ounce or until the ratio of silver to gold in American monetary stocks reached one-fourth. Over $3,000,000,000 in silver was purchased in the succeeding six years without reaching either of the two limits.

The Banking act of 1935 greatly increased the centralization of control over the banks of the country. Principal changes included: (1) creation of the federal open market committee to centralize control over open market investment operations by the federal reserve banks; (2) power given to the federal reserve board to alter member bank reserve requirements within specified limits and to control lending by banks for the purpose of acquiring securities. With minor exceptions monetary and fiscal policies during the 1930s were aimed at increasing prices and employment. For the most part they failed to accomplish their aims. Average monthly employment in 1930 and 1939 was 42,000,000, and wholesale prices (1926=100) stood at 86.4 in 1930 and 77.1 in 1939.

(M. Gt.; A. Kp.)

NATIONAL FINANCES 1940–50

The dominant factors affecting national finances in the decade 1940–50 were the vast increases in federal receipts and expenditures concomitant with World War II, the large increase in the national debt during the war years, the methods used in supporting the policy of a fixed market for government obligations at a practically stable pattern of interest rates, the use of priorities, allocations, price and wage controls during the war years and a postwar adjustment period of rapid increases in both retail and wholesale prices.

Some steps toward military, economic and financial mobilization were taken prior to the attack on Pearl Harbor in Dec. 1941. Federal expenditures in the year ending June 30, 1941, totalled $13,400,000,000—more than 45% higher than the previous year. The annual rate of increase was more than 100% in both 1942 and 1943. By 1945 total dollar federal expenditure reached a peak of $98,700,000,000. During the war years 1941–46 total federal expenditures were approximately $387,000,000,000, of which about $330,000,000,000 were classified as defense expenditures. About $176,000,000,000 was raised by taxation and $221,000,000,000 by borrowing, including $89,000,000,000 from banks. Something of the nature of the changes in government receipts and expenditures from prewar to war and postwar periods can be seen in Table II.

After the war total federal expenditure dropped sharply from the wartime levels but did not reach prewar size. Annually the range was from $34,000,000,000 in 1948 to slightly more than $40,000,000,000 in 1949 and 1950. Even this reduction left the volume of federal expenditure more than four times higher than in the prewar years of 1939–40.

The relative pattern of expenditure also was altered, as is indicated in Table II. National defense outlays remained at $12,000,000,000 to $15,000,000,000 from 1947 to 1950 or more than 12 times the prewar level; veterans' services and benefits at about $6,500,000,000 were approximately 12 times prewar and interest on the public debt reached $5,700,000,000 in 1950, a level more than five times that of 1939–40. An average expenditure of more than $5,000,000,000 per year from 1947 to 1950 on international affairs and finance reflects United States contributions for relief, reconstruction and economic aid abroad both as a result of the war and to combat the spread of Communism.

Taxation.—The increased revenues detailed in Tables I and II were brought about chiefly by increased personal and corporate income taxes, corporate excess-profits taxes and excise taxes imposed on a wide variety of consumption goods and services. Personal income taxes were the largest single source of national revenue throughout the decade. During World War II the exemption for married couples dropped from $2,500 to $1,000, and for single persons from $1,000 to $500. The lowest combined normal and surtax rate increased from 6% to 23%. On taxable incomes of $200,000 or more, the personal rate reached a peak of 94%, a maximum effective rate of 88.6%. Corporate income tax rates on taxable income were increased to 38% plus a 95% excess-profits tax, 10% of which was to be refunded to the paying corporation after the war. Federal tax receipts increased from 6.6% of the national income in 1939 to 20.2% in 1945 and 18.4% in 1950. The increase in personal income tax liability from 1913 to 1954 may be seen in Tables III and IV. Detailed changes are too numerous to mention and must be determined from the specific provisions of the various revenue acts and their judicial interpretation.

Some tax reduction took place after the end of World War II. The corporate excess-profits tax was abolished in 1946 and personal exemptions raised by $100. In 1948 a greater effective reduction took place by permitting "splitting of incomes" between husband and wife, a privilege theretofore enjoyed only by residents of community property states.

Public Debt.—Although 46% of total expenditures in World War II were financed by taxes, compared with about 26% in World War I, the public debt increased more than fivefold from $49,000,000,000 on July 1, 1941, to $269,000,000,000 on June 30, 1946. Debt policies and problems of debt management thus assumed a greater importance than ever before. During the war the treasury tried to sell as much of the increased debt as feasible to nonbank investors, particularly to individuals in the form of nonmarketable savings bonds. Sales to commercial banks or federal reserve banks were considered more inflationary than sales to other financial institutions or the general public because the former tended to expand the total money supply. The treasury also attempted to finance the debt at historically low and virtually unchanging or "pegged" rates. These aims were, to some extent, incompatible one with the other, resulting in a greater proportional increase in short-term than long-term debt, much of which went into the portfolios of commercial banks.

During the immediate postwar years of 1946–49 wages and prices rose rapidly. In attempting to offset the inflationary movement the treasury utilized a large cash balance left from wartime borrowing to retire short-term debt held by commercial banks in 1946. Part of a current budgetary cash surplus was used in a like manner in 1947–48. Whatever effects these actions may have had appear to have been more than offset by continued federal reserve support of the price structure for government securities, an expansion of commercial bank loans and a reduction of money in circulation taking place at about the same time. Both wholesale

and retail prices reached a peak in Aug.–Sept. 1948, declining temporarily in 1949.

Monetary Developments.—The dilemma of attempting to reduce inflationary pressures while maintaining low interest rates became more sharply defined as the end of the decade approached. During the war the federal reserve authorities exercised no direct monetary restraints except by selective controls on consumer credit and margin requirements. Congress increased the ability of the federal reserve banks to support treasury debt financing by permitting them to buy a limited amount of treasury obligations directly instead of through the open market, by exempting war loan deposits from reserve requirements and, in 1945 when pressure on the banks' gold certificate reserve developed, by reducing their minimum reserve requirement in gold certificates to 25%. Some short-term rates were permitted to rise in 1947 and the reserve requirements increased to the maximum permitted under the law for member banks. But the federal reserve banks continued to support the prices of government securities, thus precluding the use of traditional monetary control devices such as the discount rate and open market operations. (A. KP.)

NATIONAL FINANCES 1950–56

War in Korea, with the resulting sharp inflationary pressures in the second half of 1950, together with the subsequent decision to maintain a continuing high level of military preparedness were the dominant influences on national finances during the years 1950–56. A sharp wave of both consumer and business buying after the invasion of South Korea in June 1950 raised wholesale prices by 11% and retail prices by 5% before the end of the year. Concern over the possibility of an extended inflationary movement brought increased taxation, and abandonment of the low interest rate policy and a return to a free market in government obligations. The years following the cessation of hostilities brought an extended high level of business activity.

Taxation.—Impelled by the exigencies of the war in Korea, taxes were promptly increased in 1950 and again the following year. Personal and corporate income tax rates were increased and an excess-profits tax reimposed. A few new excise taxes were levied and the rates of some existing excises raised. The excess-profits tax was permitted to expire in 1953, personal income tax rates declined slightly in Jan. 1954 and some reductions in excise rates took place in April. Additional reductions were made both in personal and corporate rates by the Revenue act of 1954 together with a new device called a dividend income credit designed to reduce, in part, the double taxation of corporate dividends.

Public Debt and Monetary Developments.—On July 1, 1950, the total national debt stood at $257,400,000,000. By June 30, 1955, it had increased by about $17,000,000,000 to a total of $274,400,000,000. Most of the increase, however, was in the parts of the debt held by government agencies and trust funds; the publicly held debt increased by $5,600,000,000, thus accounting for less than one-third of the total increase. A comparison of the

marketable debt on the two dates reveals a reduction of about $100,000,000 between 1950 and 1955. The general policy followed over the period, it appears, was to avoid increasing the amount of the marketable debt. Tables V and VI indicate the changes in ownership and kind of government securities comprising evidences of the debt.

Beginning in Aug. 1950 with a slight increase in discount rates the federal reserve authorities began to employ the traditional instruments of monetary control which had not been used since the beginning of World War II or before. In March 1951 a formal announcement was made abandoning the policy of pegging the prices of government securities. The decision, made with the concurrence of the treasury, was known as the "accord." From 1952 to 1956 the federal reserve authorities employed all the instruments of general credit control available to them (discount rate changes, open market operations, changes in reserve requirements) in support of the particular credit policy being followed at the time. In general terms this policy was aimed at the triple objective of promoting "full" employment, stabilizing prices and fostering long-term economic growth. This resulted in credit restraint until mid-1953 and credit ease in 1953 and 1954 with mild restraint in 1955 and 1956. The treasury, reversing the policy followed during the depression and war years, appeared willing to accept the decision of the market as to the rate of interest on its securities. As new securities were issued and old ones refunded a substantial rise in the rates paid on government marketable debt took place.

Government Corporations and Credit Agencies.—A significant development of the depression years and later of the World War II and postwar periods was the large growth of government corporations and credit agencies. Essentially these instruments were used for operations that were business in character such as lending, investing and buying and selling, but which could not be carried out by private business because of their risk or their special relation to the public interest.

In attacking the varied financial problems created by the depression, the federal government made large loans and investments, directly and through governmental corporations and credit agencies; and it guaranteed a large volume of obligations issued by governmental corporations. Through the establishment of the government-owned Home Owners' Loan corporation and Federal Farm Mortgage corporation, the government provided facilities for the emergency refinancing of mortgages on homes and farms. These corporations, together with the federal land banks, the Federal Housing administration, the Federal Savings and Loan system and the Federal Savings and Loan Insurance corporation operated to stem the flood of foreclosures on farms and homes and to reduce rates of interest on mortgage loans.

In addition, emergency aid was provided for railroads, banking, insurance, industrial and commercial corporations by the Reconstruction Finance corporation. Also, the corporation instrument was used for such purposes as the rural electrification program and the power and flood control program in the Tennessee valley.

During World War II the Reconstruction Finance corporation was given broad authority to assure the required expansion of war production facilities and the output of scarce materials. In the postwar period the Commodity Credit corporation engaged in large operations to stabilize the prices of farm products while the credit facilities of the housing agency were utilized for housing purposes.

Source: U.S. Department of the Treasury.

Table VII shows the phenomenal growth in loans outstanding by the major federal government credit agencies. The postwar growth in the amount of loans outstanding was about twice the total loans outstanding before World War II. Total assets of all government credit agencies and those engaged in other business-type activities reached almost $58,500,000,000 on March 31, 1956. Federal government interest amounted to $51,600,000,000 on that date, compared with a comparable figure of $3,600,000,000 on June 30, 1939. By far the greatest amount of this increase took place in the postwar period rather than during the depression.

VII. INDUSTRY AND COMMERCE

The Growth of the American Economy.—The vast growth over the past hundred years of the industry and commerce of the United States represents the most advanced embodiment of the potentialities of the Industrial Revolution that emerged in the England of the 18th century and constitutes one of the major forces bearing upon current world conditions. In nearly all branches of production and trade, U.S. productivity greatly outdistances that of any other country and has, accordingly, established standards of efficiency by which other nations measure their own efforts to improve the performance of their economies. In World Wars I and II U.S. output of military supplies and munitions played a decisive part in determining the outcome. Finally and inescapably, the United States, as the country whose productive system is the most highly mechanized, presents the foremost challenge to man's attempts to readjust his way of life and social relations under the impact of the machine age, with all its attendant problems and seemingly limitless opportunities.

Economists have become increasingly aware that U.S. industry and commerce can be adequately understood only as functions of the growth of the economy to which they are interdependently related. Commercial development largely depends on increasing industrial productivity and, in turn, industrial expansion is limited by the nature and size of markets. In marked contrast with the need for improved understanding of the economics of growth, arising from the obstacles to economic welfare and international co-operation presented by the marked inequality between advanced and underdeveloped countries, the study is one of the most backward branches of economic analysis.

For the purposes of the economic historian, the interrelated growth processes of innovation in industrial methods or products provide a far more suitable framework for analysis than the political events about which the conventional or general historian organizes his data. Characteristically, the United States has furnished leadership in the number and extent of the transformations in economic life which it has achieved. Prominent among these were shipbuilding and shipping before 1860, the mechanization of agriculture, bulk processing of iron and other metals, the refining of petroleum for fuel, the mass production of durable goods, especially automobiles, the adaptation of electricity to practical purposes and the realization of atomic energy. But it is very likely that none of these has had so strategic an impact on the development of the U.S. economy as the era of railroad construction, sometimes referred to, by those who would emphasize the full range of its effects, as "railroadization." This era may be roughly dated as occupying the second half of the 19th century, even though a final, diminished wave of construction marked the years between 1900 and World War I.

It is a conspicuous irony of history that the redistribution in the world's balance of economic power brought about by this revolutionary mode of transportation favoured the continental nations far more than Great Britain, the country of its origin. Nor, at the time of the introduction of the railroad, did any nation stand to gain more from exploiting its potentialities than the United States. For, whatever the particular advantages enjoyed by any other nation, none could claim the combination of advantages represented by a national territory second to none in its natural wealth and a system of social and political institutions which eminently fitted its people for commercial enterprise and industrial resourcefulness.

Ultimately, of course, these complementary material and human resources alone might have sufficed to establish extraordinary economic power. On the other hand, with nothing more than human or animal means of overland transportation, U.S. economic activity must have remained closely restricted to the coastal belts and inland waterways. The agricultural and mineral resources of the interior could become of more than local significance only with the assistance of mechanical means of transportation. Once such means were available, however, these same resources not only provided the country's industrial centres with much of their food and raw materials but also supported the markets which justified economically the introduction of heavy capital equipment for mass production.

If, measured by the criteria of industrial progress, the first half of the 19th century belonged to Great Britain, leadership in the second half was so fully appropriated by the United States that by 1900 the nation's output exceeded that of Britain and Germany combined. An increase in population unprecedented for any western nation was accompanied by a similarly unprecedented rise in per capita income. Between 1860 and 1910 agricultural output more than quadrupled, although the proportion of the labour force employed on farms fell during the period from approximately 50% to less than one-third. Then, in 1890, an economic landmark was set when manufacturing for the first time exceeded agriculture in its contribution to the national income. For these reasons, the second half of the 19th century or, more precisely, the years from 1848, when the curve of railroad construction began its steep ascent, to 1910, when the second diminished wave of construction began its sharp decline, may be regarded as the principal watershed in the economic development of the United States, separating the early and the modern periods. This threefold chronological division is in keeping with a premise of growth analysis which can scarcely be overstressed. This premise is that growth, in the sense of progress rather than of mere expansion along established lines, implies the presence of elements of originality. Where powerful innovational factors are absent, economic activity is likely to remain repetitive and slow paced. It will generally be found, as is the case with U.S. experience, that the directions of greatest advance in terms of physical volume are also those marked by the highest incidence of change in methods of operation. Therefore, it is to the sources of differentiation from established patterns that we must look in order to find the keys to the understanding of the dynamic economy.

From the First Settlements to Mid-19th Century.—For more than two centuries, American industrial and commercial expansion took place along the lines characteristic of the colonial economy. A colonial economy is generally understood as one which is apt to be especially dependent upon agriculture and, beyond that, relies on its capacity to extract raw materials to exchange for the manufactured or finished goods of more highly developed countries. Indeed, the early American economy can be regarded as the classic illustration of its kind. None of this is to say, however, that there was no progress toward a more advanced stage.

From the outset, the colonies were possessed of powerful and comparatively rare advantages which promised to create conditions of a dynamic order. The natural endowments of the North American continent are even greater than is commonly supposed. Such features as its unusually high proportion of arable land and other natural resources, its extensive coastal and inland waterways and its favourable climate are well known. Less often noted is the agricultural advantage arising from the geographical situation of the United States, which not only lies entirely within the temperate zone but also coincides with the southernmost half of that zone. The country's southern extremities are just north of the tropic of Cancer and its northern limits are defined by the 49th parallel, the approximate latitude of Paris in mid-Europe and no more than 300 mi. N. of the Black sea coast of Russia. This situation means a high average declination of the sun, providing long and warm growing seasons highly favourable to many important crops. A glance at the map of the world will show that no other fertile territory of comparable extent, with the partial exception of China, occupies this advantageous position. Turning to the human resources of the colonies, we find the circumstances correspondingly propitious. Consequent upon the Reformation in northern Europe, the desire for religious freedom provided the requisite motivation for permanent settlement far more effectively than the goad of adventure.

With so strong a resource base, it was to be expected that the settlers, sooner or later, would move forward in the direction of that uniqueness of economic advantages which, as we have already suggested, is so important to a dynamic outcome. Yet the accumulation of such forces was gradual. Necessarily, they demonstrated an unmistakable pattern of relationship with agriculture and the

extractive industries. To cite only the most prominent examples, the proliferation across the free or near-free lands of farm units of larger average size than those of densely populated Europe created an order of demand, in the form of agricultural surplus, for housewares and manufactured implements that was quite unlike anything known before. This demand largely explains the eventual development of a number of industries which were, not only in quantity but also in the nature of their products, unprecedented. By 1850 American production of farm machinery led the world in scope as well as in the pace of technological improvements. The high relative value of human effort led to the ingenious improvement of tools, foreshadowing the great power tools and precision instruments of the 20th century. Simultaneously, a market was brought into being for what have become known throughout the world as American "specialties," the stock in trade of that primarily native institution, the hardware store, and precursors of today's household appliances. Moreover, the migratory ventures of great numbers of U.S. families necessitated the continual setting up of new households, resulting in an augmented demand for hard goods. The arms industry thrived on the needs of pioneer settlers scattered through the far reaches of the country. Surely this, as well as the genius of Eli Whitney, must be credited as a condition of his introducing the system of interchangeable parts in the manufacture of firearms—a system which has become a primary technique of modern manufacture.

But it was in shipbuilding and shipping that the greatest triumphs of early American industry and commerce were achieved. This great enterprise, too, rested squarely on extractive industries. Production flourished, thanks to the large stands of virgin timber accessible to the sea or to river estuaries, the hardwoods furnishing prime lumber for the making of vessels and casks and the softwoods for naval stores, especially tar, turpentine and resin. Growing demand for ships arose from the needs of the great New England fishing and whaling fleets as well as from the coastal and overseas trades.

The country's international trade, made up largely of exports of American raw materials and the import of European manufactures and oriental luxuries, was importantly supplemented by the "triangular trade" with the West Indies and Africa, in which slaves, dried fish and rum were exchanged for molasses and casks.

The innovational and quantitative records established by the merchant marine were the phenomenon of the period. Important numbers of ships were exported to Europe. As if either accomplishment were not impressive enough in itself, the United States concurrently made the steamboat commercially successful and produced the fastest wind-propelled vessel ever devised for commercial use. The "Yankee Clipper" symbolized, in its stark functionalism aimed directly at competitive efficiency, the spirit of U.S. enterprise. In the banner year of their history, 1855, the shipyards of the United States launched a documented total gross tonnage in merchant sailing ships of 505,323, a record which was never equalled by their production of steam vessels until the defense shipbuilding of World War I. Especially in Boston and the other great ports of the northeast, the sailing and shipbuilding industries became the preponderant initial sources of U.S. capital. The sailing ship itself symbolized an American epic. Quite apart from its literary significance, *Moby Dick* still reminds Americans that New Englanders were virtually alone among the whalers of the world in hunting the formidable sperm whale for its supremely valuable oil. U.S. shipping was to prove no match for low-cost British competition in the age of steam. Yet the energies which a restless people had expressed in their early commercial enterprise gave an earnest of things to come in transportation and communication on land and in the air.

Having noted these prominent instances of departure from colonialism, we may now turn briefly to agriculture and the extractive industries, on the one hand, and, on the other, to forms of manufacture in which colonial enterprise, shielded by transportation costs, made headway domestically but was unable to do much more than duplicate the performance of British industry on a reduced scale.

Subsistence farming and the domestic crafts constituted the overwhelming means of livelihood for the colonists. The principal support of the export trade, however, came from the staple or cash crops. In the southern colonies these were led by tobacco, rice and indigo until after 1793 when the cotton gin provided the keystone to the south's cotton empire, destined to produce 2,000,000,000 lb. annually by 1850. Lumbering, followed by fishing, were the main resources of New England. The fur trade, in which the pelt of the ubiquitous beaver played the leading role, ran its chequered but significant course in the inland areas both north and south, although exports funnelled principally through the port of New York. In the middle colonies, wheat early became the principal staple crop. Flour milling made rapid strides in New York, Pennsylvania and Maryland, so that by the time of the Revolution, the nation's exports of flour were exceeded in value only by those of tobacco. In 1850, however, the relative importance of the staple crops had changed radically from the pre-Revolutionary era. With the opening of the Northwest territory, especially the Ohio river valley, corn or maize, utilized mainly for the feed of livestock, surged ahead to a value twice that of wheat, in second place. Cotton, hay, oats, potatoes and tobacco followed in that order. The ascendancy of corn signalled U.S. emergence as the world's leading meat producer, foreshadowing extraordinary advances in the technology of meat processing.

Mining got off to a very slow start, iron alone showing a significant growth potential. Domestic coal production found difficulty in meeting the competition of British coal, upon which the colonies largely depended before the Revolution. Copper and lead were mined in very small quantities. Britain's want of high-grade iron ores, however, provided the colonies with profitable conditions not only for the mining of ore but also for smelting. An act of 1750, partly motivated by the British government's disinclination to become dependent on the Baltic countries for the metal, admitted colonial pig iron to the mother country duty free. And as England was soon to enter its great period in the development of iron manufactures, the stimulus to the American mines and smelters increased steadily. By mid-19th century production exceeded 2,000,000 long tons. Beginning around 1820, when little more than 300,000 tons were produced, coal (especially Pennsylvania anthracite) grew in use as domestic fuel, particularly in the cities where it could compete with firewood. By 1840, further stimulated by the early use of coal in steam engines and as coke in the manufacture of iron, output rose to 2,500,000 tons.

Given the state of the industrial arts in the world at large before 1850, it is clear that the country's progress at the higher levels of production before that date was bound to be circumscribed by the scope of its invasion of textile manufacturing, the original home of the British factory system. But it was just here that Britain's head start in manufacturing efficiency, coupled with labour costs as much as 50% lower, prevented U.S. producers from competing strongly not only in overseas markets but even domestically. Moreover, the widespread dispersion of the population in rural areas favoured the continuation of household output, which as late as 1830 provided more than two-thirds of the nation's supply of cloth. Meanwhile, the opposition of the southern states kept tariffs on textile imports quite low before the Civil War, Nevertheless, as cotton fabrics came to be accepted as substitutes for those of flax and linen, after about 1800, small mills for carding and spinning of yarn sprang up along the streams of the northeastern states, creating the millpond that remains a picturesque feature of the countryside. The foundations of the New England textile-manufacturing industries were laid during the first three decades of the 19th century. Significantly, the early textile entrepreneurs were supported in one direction by capital accumulated in the shipping industry and in another by espionage measures which penetrated the jealously guarded secrets of the Lancashire cotton mills. Mechanical weaving of cloth was first successfully applied to cotton and then to wool. By 1850 the volume of cotton consumed annually by the industry, destined to approach 4,000,000 bales by the end of the century, amounted to 575,000 bales. With the value of cotton goods roughly twice that of woollens, the trade by mid-century supplied the major share of the domestic market and became for a time the country's leading industry. But not

until the second half of the century, following the improved application of steam power and the protection of higher tariff barriers, did U.S. production, primarily for the mass market in the cheaper grades of material, challenge Britain's long-lived supremacy.

In the case of metal processing or manufacture, the nature of American progress was more divided. In the 18th century domestic iron rolling and forging was extremely localized and, because of restrictive colonial limitations, reduced largely to the status of "moonshining." Of course the wars between 1776 and 1815 provided the domestic ironmasters with more than enough business, and this furnished the impetus and capital for some sizable foundries, of which the largest were in Pennsylvania. But, in the interim, British technology had made comparatively giant strides, principally related to the substitution of coke for charcoal, which made possible better control of the properties of steel, but supplemented by improvements in puddling and rolling. U.S. supply conditions hindered use of coke before 1840, when the Pennsylvania mills initiated methods for the employment of the state's abundant anthracite. Consequently, the industry, despite high tariff protection, remained backward before the 1850s and was especially derelict with respect to advance in steel manufacture.

To sum up, the economic growth of the United States during this period remained in the shadow of Britain's epochal advances, which are commonly regarded as having reached their greatest force between 1770 and 1830. With some signal exceptions, the founders of the new nation were content to consolidate their economic hold on a new continent in keeping with the lines laid down by Britain, offering that country raw materials but remaining inferior to it in the production of finished goods and relying upon it for much of the real and money capital they required. Nevertheless, by 1850 the period of colonial development had nearly run its course, and all of the essential ingredients for the unparalleled material progress of the next hundred-year period were in readiness.

The Building of the Modern Economy.—The "colossalization" of U.S. industry in the form of mass production and of U.S. domestic commerce in the form of mass marketing manifestly proceeded on rails, first of iron, then, under the prodding of Andrew Carnegie, of steel. The great gridwork of the railroad system rapidly harnessed the resources of the North American continent, attaining a mileage of 250,000 shortly after 1910, more than 25% of the world total at mid-20th century. Early in the 1850s a rate of construction in excess of 2,000 mi. annually was attained; in the peak year of 1887 nearly 13,000 mi. of track were laid. Railroads both consumed and distributed unprecedented tonnages of coal. Helping to bring together the twin ingredients of steel, coal and iron ore, railroads became the steel industry's best customer and the prime shipper of its products. Nor should the consequences to human mobility be slighted. Later generations, conditioned to think of speed in terms of flight, easily forget that, relative to the transportation conditions preceding the introduction of the two revolutionary modes of conveyance, the contribution of the railroad to speed of overland movement was at first more impressive than that of the aircraft.

In the midst of this profound economic reorganization of the country, a new industrial departure, destined to provide the impetus of the cumulative technological progress of the modern era, was set in motion. It was heralded by Andrew Carnegie when, speaking of the technical problems in steel production, he said: "Nine-tenths of the uncertainties were dispelled under the burning sun of chemical knowledge." While for more than a century industry had found in the discoveries of scientists one of its mightiest resources, Carnegie, taking his cue from Germany, undertook in 1873 the employment of highly trained scientists for full-time research on the properties of minerals. Applied scientific research, adopted as a department of industry, was to become the key to the great chemical processes which within a few decades were to derive from metals, coal, petroleum and even common clay a myriad of novel substances in the forms of elements, alloys and synthetics. This development, more significantly than the time-and-motion studies of Frederick W. Taylor, laid the groundwork of what is now referred to as "scientific management."

Meanwhile, almost as if by reflex action from the centralization of industrial activity which the railroad made possible, the major movement toward massive consolidation of industrial power got under way. The Standard Oil trust was organized in 1882 by John D. Rockefeller and his partners. In 1901 a near monopoly of the country's then greatest industry was attained when the United States Steel corporation was formed under the financial leadership of J. P. Morgan.

Except for comparatively minor cyclical interruptions (notably the panic years of 1857, 1873, 1893, 1907 and 1913), the era of the continual accumulation of record-breaking statistics had arrived. Coal and steel production rose in close synchronization with the increase in ton-miles of freight carried by the railroads—from about 10,000,000,000 in 1870 to nearly 150,000,000,000 in 1910. The output of coal rose from less than 10,000,000 tons in 1850 to 500,000,000 by 1910. The output of steel, less than 100,000 long tons before 1872, passed 25,000,000 by 1910. Comparable records in terms of rates of growth were established by copper, lead and zinc smelters. Although petroleum production was to await its most notable expansion until the great increase in the number of automobiles during the 1920s, annual domestic output exceeded 200,000,000 bbl. by 1910, and this record, as the Standard Oil company's successful measures for gaining control of the industry demonstrated, was almost entirely keyed to rail transportation. From 1863 to 1899 manufacturing production (W. M. Persons' index of physical production of manufacturing) rose 705.3%, a markedly greater relative increase than that of the longer period of 1899 to 1947 which amounted to 549.0% (National Bureau of Economic Research index of physical output, all manufacturing industries).

The consequences for U.S. living standards were pronounced. Per capita income, which had risen little more than 10% during the first half of the 19th century, more than doubled during the second half. The actual increase of 105.3% was only slightly inferior to the 111.2% gain between 1899 and 1949. (Estimates derived from figures computed by W. S. and E. S. Woytinsky, *World Population and Production, Trends and Outlook*, p. 383 [New York, 1953], from original estimates of Robert F. Martin and, from 1929, the United States Department of Commerce. Estimates until 1859 are rough.)

The outstanding distinction of the U.S. economy lies in its attainment of world leadership jointly in the two respects of magnitude of scale and efficiency of operation. A few of the extremely large nations equal or exceed the United States in size of population or extent of territory. Australia, New Zealand and Canada, alone among the world's nations, come within 10% or 20% of matching its productivity as measured by the value of output per worker. But the small populations of these countries and the relatively low productivity of all the other larger nations have prevented any of them from remotely approximating the total output of the United States. According to the best available estimates, U.S. industrial productivity at mid-20th century was nearly two and one-half times that of any European nation and more than four times that of the Soviet Union, even when no allowance is made for the shorter American work day; in agriculture the discrepancy is still greater.

Economically, the most decisive sequence of events in the growth of U.S. industry and commerce is attributable to the nation's successful maintenance of a unified economy of great scale. The intensive geographical and occupational specialization of effort which has been the foundation of cost reduction would have been possible on no other basis. Barriers between the various sections of the country, whether in the form of man-made restrictions or physical inaccessibility, would necessarily have hindered the approach that has been made to optimum allocation of effort.

Of the many directions that specialization has taken, the most fundamental has been that between agriculture and industry. The U.S. farmer forsook the domestic crafts in order to concentrate on the production of cash crops to exchange for manufactured goods. But his opportunity of doing so was contingent upon the economy's ability to afford the costs of the transportation which had to be provided. To meet these costs two conditions were fulfilled: first,

an agricultural surplus on the farm sufficiently generous to support a large number of workers in the transportation, manufacturing and marketing trades; and, second, efficient, or low-cost, transportation. The first was assured by the liberality of nature in rewarding toil. The second was furnished by a series of notable responses on the part of free business enterprise to a new environment in the form of improved means of transport and communication.

Concurrently, advances in physical mobility were vitally augmented by increasing social mobility, an important aid to occupational differentiation. The U.S. economy has from the outset been peculiarly mobile; it is difficult to suppose that it can cease to be so except with most serious consequences; but it is likely to remain so for the foreseeable future. (D. E. R.)

INDUSTRY AND DOMESTIC COMMERCE IN THE 20TH CENTURY

Through the introduction of a succession of innovational products and methods—most prominently those associated with the automobile, machinery, electrical, chemical, aircraft and atomic industries—the 20th century continued the rapid economic growth of the preceding half century and actually exceeded the latter's achievements in terms of absolute volume of output. From 1919 to the mid-1950s the nation's output of goods and services increased more than 200% (in constant dollar values). A statistical picture of this growth can be seen in gross national production and national income data.

Gross National Product and National Income.—Gross national product (GNP) measures output of goods and services in market value and reflects the total dollar value of production. National income represents the aggregate earnings of labour and property from current production, and includes compensation of employees, income of unincorporated enterprise, rental income and net interest. National income, unlike gross national product, is computed after deduction of indirect business taxes and of depreciation charges and other allowances for business consumption of durable capital goods. The department of commerce began publication of official national product and income figures in 1929, and Simon Kuznets and his associates at the National Bureau of Economic Research developed figures for the years 1919 through 1938. Table I includes the latter figures for 1919 through 1928 and official figures beginning in 1929. Kuznets' figures indicate a post-World War I depression trough for GNP of $67,400,000,000 in 1921 and a climb to $91,100,000,000 in 1926; the official figures indicate a 1929 peak of $104,400,000,000. Statistics for the next few years reflect the precipitous fall from the prosperity of 1929 into the deep depression of the early 1930s, and the steady climb, interrupted by the brief recession of 1938, until by 1941 GNP totalled $125,800,000,000. During World War II a major increase in national output occurred, together with some price advances, and GNP and national income rose substantially. A postwar readjustment occurred in 1945 and 1946, but this setback was only temporary. GNP advanced at a rapid rate in the late 1940s and 1950s. By 1956 gross national product was at an all-time high of $412,400,000,000 and national income reached $342,400,000,000.

In spite of numerous cyclical fluctuations, figures for gross national product and national income suggest that the outstanding feature of United States economic development in the 20th century was the tremendous growth of the economy. Population expanded greatly and the larger work force was equipped with a greatly expanded volume and improved quality of machinery and plant facilities, as well as with such intangibles as better education and more advanced knowledge. The more efficient utilization of human and natural resources has enabled the economy to produce a vastly increased quantity of goods and services, with the people enjoying high income levels and living standards.

National income represents the aggregate earnings of labour and property from current production. Table II classifies these earnings, according to the form in which they accrue—compensation of employees, profits of corporate and unincorporated enterprises, net interest and rental income of persons. After 1929 there were marked increases in the relative importance of employee compensation and of corporate profits, and parallel declines in the other income shares. Compensation of employees rose from $51,100,000,000 in 1929 to $223,200,000,000 in 1955, or from 58.2% to 68.9% of total national income. The advance of income of unincorporated enterprises from $14,800,000,000 in 1929 to $39,000,000,000 in 1955 was less than the rise in national income, primarily because of the relatively small rise in the farm component. Farm proprietors' income declined from 6.8% of total national income in 1929 to 3.6% in 1955. Rental income also showed a sharp proportionate decline after 1929. The $5,400,000,000 received in this form in 1929 constituted 6.2% of national income, while the $10,100,000,000 in 1955 represented only 3.1% of the total. Corporate profits (before taxes) increased from $10,100,000,000 in 1929 to $40,900,000,000 in 1955—from 11.5% to 12.6% of national income. The remaining distributive share, net interest, fell from 7.3% of national income in 1929 to 3.3% in 1955.

With the shifts in distributive shares there were important changes in the industrial origins of national income. Such changes are indicative of the way in which the allocation of economic resources has been altered to meet changes in demand for the nation's output. Income originating in each industry measures the

earnings of the resources—both labour and property—utilized by it. Therefore, the breakdown of national income by industrial origin provides a measure of the net contribution to national output of each industrial segment of the economy. Such a breakdown for the period after 1929 is given in Table III.

Manufacturing industries showed a continual growth in their relative contribution to national income. In 1929 they provided 24.9% of national income, whereas in 1955 they contributed 31.4%. This rise directly reflects the increasing degree to which national endeavour centred upon the fabrication and processing of commodities. Wholesale and retail trade were also affected by the relative increase in the demand for commodities; their share of national income increased from 15.2% in 1929 to 17.0% in 1955. Government (federal, state and local) contributed $5,100,000,000 of national income in 1929 and $37,700,000,000 in 1955—an increase from 5.8% to 11.6%. With the rise in relative importance of manufacturing, trade and government as sources of income, other shares either declined or remained fairly stable. The share of national income originating in agriculture, forestry and fisheries (consisting almost wholly of income from farming) amounted to 4.9% in 1955. This was considerably below the 9.4% contribution of the agricultural sector in 1929. Mining, finance, insurance and real estate, transportation and services also contributed smaller shares to national income in 1955 than in 1929.

Productivity Increases.—Gross national product was $412,400,000,000 in 1956, as compared with $73,200,000,000 in 1919. This comparison reflects the combined influence on the current market value of total output exercised by greatly increased physical volume and by much higher prices. Adjusting gross national product to constant dollars indicates the increase in national production, exclusive of price changes. Table IV shows the private gross national product in constant (1953) dollars from 1919 to 1953. It also shows estimates of man-hours employed in the total economy and real product per man-hour—a fairly accurate estimate of productivity. After 1919 the rate of expansion in the real volume of output in the private sector of the economy averaged about 3% per year. In part, this growth reflected the gradual increase of the nation's manpower resources; man-hours employed increased from 100,100,000,000 in 1919 to 126,300,000,000 in 1953. The increase in production of commodities, however, was much greater, because of sizable gains in productivity per unit of manpower utilized. The real product per man-hour (in 1953 dollars) in the private nonfarm sector of the economy increased from $1.367 in 1919 to $2.804 in 1953, an increase of 105%. Real product per man-hour on farms increased from $0.682 in 1919 to $1.437 in 1953, an increase of 111%. It is interesting to note that actual man-hours employed on farms declined from 23,600,000,000 in 1919 to 15,100,000,000 in 1953; this was in contrast to the increase in the contribution of farms to gross national product from $16,100,000,000 to $21,700,000,000.

The increases in productivity shown in Table IV, although expressed in terms of output per unit of labour input, are attributable not only to labour, but jointly to all of the factors influencing productivity. Changes in productivity are the joint result of a large number of separate though interrelated influences, such as technical improvements, the rate of operations, the rapidity of the flow of materials and components, the skill and effort of the work force, the efficiency and organizational ability of management, the state of labour relations and many others.

Shifts in Occupations.—During the 19th and 20th centuries the accelerated production and distribution of agricultural, indus-

*These farm man-hours represent adult equivalent man-hours rather than those actually worked. They are estimated by the Department of Agriculture from results of farm management studies and show the number of man-hours adult workers would need to work to produce the output of a particular year. Estimates of the actual hours worked by all farm workers, including women and children, are not available, particularly for the earlier years. †Preliminary.

Source: Joint Committee on the Economic Report, *Potential Economic Growth of the United States During the Next Decade* (Washington, D.C., 1954). Data are revisions by staff, Joint Committee on the Economic Report, of estimates of John W. Kendrick in his paper, *National Productivity and Its Long-Term Projection* (Conference on Research in Income and Wealth, May 1951).

trial and mineral products brought about important changes in the occupations of U.S. workers. Perhaps nowhere was this occupational change more marked than in agriculture. In 1820, for example, 72% of the gainfully occupied persons were engaged in agricultural pursuits. By 1880 this had decreased to 49%, by 1900 to 35%, by 1920 to 26%, by 1940 to 19% and by 1950 to 12%. Between 1940 and 1950 alone the number of persons engaged in agriculture declined from 8,391,022 to 6,884,970, a reduction of 18% (*see* Table V). This reduction in the number of persons employed on farms was not the result of a decline in agricultural production; on the contrary, agricultural production increased. The decline resulted from greatly increased productivity in farming.

TABLE V.—*Industry Group of Employed Persons in the United States, 1940 and 1950*

Industry group	1940		1950		Percent increase 1940–50
	Number	Distribution %	Number	Distribution %	
Total employed persons	44,888,083	100.0	56,239,449	100.0	25.3
Agriculture	8,391,022	18.7	6,884,970	12.2	−18.0

Source: U.S. Department of Commerce, Bureau of the Census, *Census of Population: 1950* (Washington, D.C., 1953).

The employment trend in manufacturing, as would be supposed, was the reverse. In 1820 only 12% of gainfully occupied persons were engaged in manufacturing, hand trades and construction. By 1880 this had increased to 18.5%. By the turn of the century, with the quickened pace of commodity processing and marketing, not only had employment in manufacturing increased, but employment in the wholesale, retail and service trades had become an important factor.

These trends continued between 1900 and 1950, and by 1950 employment in manufacturing reached 14,575,692, nearly 26% of total employment. Employment in wholesale and retail trade stood at 10,547,569, nearly 19% of the total.

The shifts in occupations were paralleled by an increase in the employment of women throughout the country. In 1890 there were 3,596,615 employed women; in 1950 the total was 15,719,987, an increase of 337%. Between 1940 and 1950 the number of employed women increased by 41.1%, compared with a 20.1% increase in the number of male workers.

Manufacturing Industries.—Between 1899 and 1954 the number of manufacturing establishments in the United States increased from 204,754 to 288,144 (*see* Table VI). During this time the number of production workers in these establishments grew from a total of 4,501,919 in 1899 to 12,397,000 in 1954. Value added to the products processed increased steadily over this period, except for the depression years of 1920–21 and the early 1930s. Between 1939 and 1954, value added by manufacture increased from $24,500,000,000 to $116,000,000,000, an increase of 374%.

Although part of this increase was a result of rising prices, the growth in real output of commodities was the major contributing factor. Wages paid to production workers increased from $9,000,000,000 in 1939 to $30,200,000,000 in 1947 and to $44,600,000,000 by 1954.

TABLE VI.—*General Statistics for All Manufacturing Industries in the United States, 1899–1954*

(value figures in $000)

Year	Number of establishments	Production workers		Value added by manufacture*
		Number (average for the years)	Wages	
1899	204,754	4,501,919	$1,892,574	$4,646,981
1904	213,444	5,181,660	2,440,851	6,019,171

1947	240,881	11,916,188	30,242,343	74,425,825
1954	288,144	12,397,000	44,631,000	116,001,000

*Value of products less cost of materials, supplies, fuel, electricity and contract work. For 1899–1933, cost of contract work was not subtracted from the value in calculating value added by manufacture. †Data for 1899–1914 include all establishments having products valued at $500 or more; from 1914 on, those having products valued at $5,000 or more.

Sources: U.S. Department of Commerce, Bureau of the Census, *1947 Census of Manufactures* and *1954 Census of Manufactures, Preliminary Report.*

Table VII provides a breakdown by major industry groups for the years 1939, 1947 and 1954 with respect to three items: the number of establishments, the number of production workers and value added by manufacture. In number of establishments, those manufacturing food and kindred products led all others with 42,443 in 1954. In second place were establishments manufactur-

TABLE VII.—*Comparative Summary of Major Manufacturing Groups, 1939, 1947 and 1954*

Group	Number of establishments			Number of production workers			Value added by manufacture (in $000)		
	1939	1947	1954	1939	1947	1954	1939	1947	1954

Sources: U.S. Department of Commerce, Bureau of the Census, *1947 Census of Manufactures* and *1954 Census of Manufactures, Preliminary Report.*

Establishments manufacturing such transportation equipment as automobiles, trucks, aircraft and ships led in number of production workers with 1,329,000 in 1954. In second place were establishments manufacturing such nonelectrical machinery as machine tools, office equipment and construction and mining equipment with 1,175,000; and in third place were establishments manufacturing food and kindred products, with a 1954 figure of 1,143,000.

Transportation equipment manufacture also led in value added by manufacture; with a 1954 figure of $13,700,000,000. In second place were food and kindred products manufacturers with $13,500,000,000, followed by nonelectrical machinery with a value added of $12,300,000,000. After 1939 there were notable changes in the relative positions of the various manufacturing industries as indicated by both production workers and value added. The food and kindred products, textile, apparel, leather and lumber industries declined, whereas the transportation equipment, machinery, metals and chemical industries increased in relative importance.

Manufacturing is concentrated in the middle Atlantic and east north central sections of the United States (*see* Table VIII). These two regions provided $66,800,000,000 in value added by manufacture in 1954, more than 57% of the value added nationally.

TABLE IX.—*Value of Mineral Production in the United States, 1925–1953*
(in $000,000)

Year	All mineral products	Metallic minerals	Nonmetallic minerals		
			Total	Fuels*	Other

The Pacific states were third in importance with value added of $11,300,000,000, followed by the south Atlantic area with $10,600,000,000. In spite of the predominance of the northeastern section of the nation as the manufacturing hub, there is strong evidence of a dispersion of these activities to the southern and western regions of the nation. The Pacific states provided 6.3% of the national value added in 1939 and 9.7% in 1954. The west south central region's percentage increased from 3.3% in 1939 to 4.9% in 1954. By contrast the New England area had 9.9% of national value added in 1939 and only 7.8% in 1954.

Mineral Industries.—From 1880 to 1953 the total value of all mineral products in continental United States multiplied about 40 times. Total value in 1880 was $367,000,000; in 1953 it was estimated at $14,400,000,000.

From a level of $5,300,000,000 in 1926, the value of mineral production declined during the depression to a low of $2,000,000,000 (*see* Table IX). The value increased slowly during the 1930s, and rapidly during World War II. Value of mineral production

TABLE X.—*Value of Shipments and Employment in Selected Mineral Industries, 1939 and 1954*

continued to increase in the postwar period, part of this increase reflecting the increasing price levels for most minerals, and part reflecting increased volume of production. Of the 1953 totals, $1,800,000,000 represented the value of the production of metallic minerals, $12,600,000,000 the value of production of nonmetallic mineral products and $10,200,000,000 the value of fuels. The most phenomenal growth came in the utilization of fuels. In 1880 the value of fuels—including coal, natural gas, gasoline and other petroleum products—made up only 33% of the total value of all mineral products; in 1953 the value of fuels contributed 71% of the total. Table X lists the value of shipments and employment for the major mineral industries in 1939 and 1954. Major increases occurred between 1939 and 1954 in employment in and value of output of the petroleum industries, iron ores, tungsten and other categories. Gold and silver mining showed significant declines in both value of shipments and employment.

In spite of the large increases in physical volume of production of most mineral products, there has been a steady decline in the number of employees engaged in mining and related activities.

TABLE XI.—*Wholesale Trade by Type of Operation and Kind of Business in the United States, 1948 and 1954*

Type of operation and kind of business	Establishments		Sales ($000)		Paid employees*	
	1948	1954	1948	1954	1948	1954
Total wholesale trade	216,099	252,318	180,576,659	234,974,422	2,305,403	2,590,236

Scrap, waste materials dealers	6,440	8,189	2,663,631	2,405,590	59,795	67,847
Other merchant wholesalers	13,348	17,997	8,116,893	9,512,954	136,947	157,841

*Work week ended nearest to Nov. 15.

Source: U.S. Department of Commerce, Bureau of the Census, *1954 Census of Business, Wholesale Trade.*

This decrease is primarily the result of the increased mechanization of mining operations and the consequent increase in productivity. In 1915, 734,008 production workers were engaged in coal mining; in 1953 the figure was 351,126. In mines other than coal there were 152,118 workers in 1915 and 85,294 in 1953. In quarries and related industries the figures were 100,740 in 1915 and 83,641 in 1953. Total employment in the mineral industries in 1915 was 1,067,817, compared with a figure of only 598,785 in 1953. Using the year 1947 as 100, output per man-hour in mining increased from 62.9 in 1929 to 105.7 in 1950. Nowhere in the U.S. economy was there so dramatic an illustration of the impact of improved equipment and methods upon productivity.

Wholesale Trade.—A comparative study of wholesale establishments for the years 1929 (with its first official *Census of Wholesale Distribution*), 1939, 1948 and 1954 shows a steady increase in number, volume of sales and employment for wholesale establishments. In 1929 there were 168,262 wholesale firms in the nation, in 1948 there were 216,099, and by 1954 the number had increased to 252,318. Employment in these establishments increased from 2,305,403 in 1948 to 2,590,236 in 1954. The payroll for all wholesale establishments in 1954 amounted to $11,000,000,000. Included in the 252,318 wholesale establishments in 1954 were 165,153 merchant wholesalers with sales of $101,100,000,000, up 34% from the 1948 figure of $75,500,000,000. Merchant wholesalers employed 1,440,738 workers in 1948 and 1,686,501 in 1954. Table XI provides statistics on wholesale trade by type of operation and a breakdown for 1948 and 1954. It is apparent that grocery, confectionery and meat wholesalers are most important in volume of sales, with $22,000,000,000 in 1954. Machinery, equipment and supplies distributors are next in sales volume, followed by farm products merchants and dry goods, apparel and furniture wholesalers.

Retail Trade.—The first complete measure of retailing for the United States was contained in the 1929 *Census of Retail Distribution.* For that year the total sales of retail stores (1,543,138 establishments) amounted to $49,100,000,000. The trough of the depression in retailing came in 1933 when sales dropped to $24,500,000,000. By 1935 a total of 1,587,718 stores had sales of $32,800,000,000 and by 1939 a total of 1,770,355 stores had sales of $42,000,000,000. Nine years later, however, in 1948, a lower number of stores—1,668,479—had sales of $128,800,000,000, an increase of more than 200% over 1939. By 1954 the 1,721,650 stores had sales of $170,000,000,000. Table XII shows in detail the kinds of businesses, and their sales, for 1948 and 1954.

TABLE XII.—*Comparative Summary of Retail Trade, 1948 and 1954*

Kind of business	Number of establishments		Sales ($000)	
	1948	1954*	1948	1954*
Total retail trade	1,668,479	1,721,650	$128,849,252	$169,967,745

TABLE XIII.—*Comparative Summary of Selected Service Trades, 1954*

(value figures in $000)

Kind of business	Number of establishments	Receipts for year	Yearly payroll	Paid employees
Selected services, total	785,589	$23,487,419	$6,525,915	2,360,741
Personal services	348,843	5,772,869	1,960,442	820,281
Business services	88,661	6,289,324	1,474,599	402,955
Automobile repair services, garages	94,342	2,222,672	487,655	157,437
Miscellaneous repair services	113,429	1,795,758	455,056	125,685
Amusement, recreation services	73,352	4,379,897	1,252,635	434,031
Hotels, motels, tourist courts, camps	66,962	3,026,899	895,528	420,352

Source: U.S. Department of Commerce, Bureau of the Census, *1954 Census of Business, Selected Services.*

It is interesting to note that about 76,000 fewer food stores were in operation in 1954 than in 1948, even though sales had increased from $29,200,000,000 to $39,800,000,000. These statistics reflect the continuing trend toward the larger supermarket type of food store with its high sales volume and away from the smaller neighbourhood store. The number of eating and drinking places declined by about 6,000 between 1948 and 1954 and the number of liquor stores declined by 1,700. The accelerated increase in population, in the building of new homes, in the migration of families and in the development of new products was reflected in the 14% increase of 1954 over 1948 of furniture, home furnishings and appliance stores. In 1948 there were 80,423 such stores; in 1954 there were 91,797. The number of lumber, building materials and hardware stores likewise showed an increase over 1948, when there were 97,342 such stores; in 1954 there were 100,519, an increase of more than 3,000. Apparel and accessories stores also increased in number as did gasoline service stations, drugstores, fuel and ice dealers, feed stores and jewelry stores. There was also a major increase in number and sales of nonstore retailers between 1948 and 1954, reflecting the increased sales through vending machines, mail order and household selling.

Service Trades.—In the nine years following 1939, the first year for which the census bureau issued figures on selected service trades, the country showed a slight decrease in the number of service establishments, from 570,057 in 1939 to 559,559 in 1948. However, the receipts of service trades for 1948 of $8,600,000,000 were substantially higher than the receipts of service trades of $3,000,000,000 in 1939. By 1954 (*see* Table XIII) there were

785,589 establishments engaged in providing selected services; these establishments had yearly receipts of $23,500,000,000. They employed 2,360,741 workers and had payrolls of $6,500,000,000 during that year. This group does not include such categories as medical and other health services, legal services, educational services, nonprofit membership organizations, private households and some other types of services.

FOREIGN COMMERCE

Importance of Foreign Commerce of the United States.—The United States occupies a dominant position in the world economy. Although it has only about 6% of the total world population, it produces more than 40% of the total world output of goods and services. It generates more than half of the total world savings, and as a result is the most important creditor country. In 1951–55 U.S. exports amounted to approximately 20% of total world exports, and U.S. imports to about 15% of total world imports. The level of United States foreign commerce is thus of great significance to the world economy, and fluctuations in such commerce have wide repercussions.

The foreign commerce of the United States, however, is not as significant in relation to national product and national income as it is in a number of other countries. Merchandise exports amount to about 5% of national income and merchandise imports to about 3½%, while exports of such countries as Argentina, Australia, Belgium, Canada, Great Britain and Sweden amount to about 20% of national income, and exports of such countries as Denmark, the Netherlands, New Zealand and Norway amount to 30% to 40% of national income.

From these comparisons it should not be inferred that foreign commerce is of little importance to the United States. For many commodities, the percentage of total production exported is much higher than 5%. In recent years, over 40% of the rice grown has been exported, over 33% of the cotton, wheat and inedible tallow, 25% of the soybeans and tobacco, over 20% of the lard, over 30% of the rolling-mill machinery and parts, over 20% of the tractors, sewing machines and textile machinery and between 10% and 20% of the printing machinery, oil-field machinery and tools, office appliances, motor trucks and coaches and agricultural machinery (other than tractors).

In certain commodities the United States is entirely dependent on imports; *e.g.,* natural rubber, tin, industrial diamonds, coffee, cocoa and tea. It imports 90% or more of its nickel, cobalt, chromite, asbestos and manganese, more than half of its tungsten and more than one-third of its copper, lead and zinc.

Balance of Payments.—A record of transactions with foreign areas during a given period is termed a balance of payments. (In some respects this term is misleading, because transactions are recorded, not simply payments; for example, exports sent as gifts are included, although no payment is involved. Because of customary usage, the term balance of payments has been retained.) In the current account section of the balance of payments are recorded exports and imports of goods and services; in the capital account section, changes in international claims, such as loans, foreign bank deposits and gold movements. The difference between exports of goods and services and imports of goods and services may be partially offset by unilateral transfers (gifts, etc.), which are sometimes shown separately and sometimes included in the capital account; the remainder of the difference is offset by capital movements and gold movements. Since the principles of double-entry accounting are followed, the balance of payments should balance; but because statistics are obtained from many different sources (customs reports, steamship companies, questionnaires to tourists, etc.), there is always an errors and omissions item.

Balance of payments data for the United States are shown in Table XIV. It will be noted that exports of goods and services exceeded imports by approximately $5,000,000,000 in each of the years 1951–54, and $4,000,000,000 in 1955. Foreign countries purchased that much more in goods and services from the United States than they were able to pay for from funds derived from sales of goods and services to the United States. The resulting "dollar gap" was met by unilateral transfers, both private and governmental. In 1953 such transfers enabled foreign countries to add more than $1,000,000,000 to their gold reserves, and more than $2,500,000,000 to their total gold and dollar reserves, substantially improving their liquidity position for international payments. The increase in these gold and dollar reserves in 1954 and 1955 combined totalled nearly $4,000,000,000. Estimates of the balance of payments for the United States have been compiled by the United States department of commerce since 1919. Dollars supplied to the rest of the world by U.S. imports, payments for services and the outflow of long-term capital dropped sharply after World War I; and, after partial recovery during the 1920s, there

was another sharp drop from 1929 to 1933. In 1939 dollars supplied totalled less than $4,000,000,000 as compared with more than $10,000,000,000 in 1919. Foreign trade during World War II was dominated by government wartime transactions. After World War II unilateral transfers continued to be important in supplying

dollars to foreign countries. The report of the commission on foreign economic policy appointed by Pres. Dwight D. Eisenhower concluded in early 1954 that "much yet remains to be accomplished before a dependable and durable solution of the dollar problem can be achieved."

Merchandise Trade.—United States merchandise exports averaged $44,000,000 annually in value in the last decade of the 18th century; by the corresponding decade of the 19th century, they averaged nearly $1,000,000,000 annually in value; and by the middle of the 20th century they exceeded $12,000,000,000 annually.

Imports, which averaged $56,000,000 in the last decade of the 18th century, rose to nearly $750,000,000 by the end of the 19th century, and to approximately $9,000,000,000 by the middle of the 20th century. With the great expansion of United States industry and commerce in the 1870s, the country developed an excess of exports over imports which has continued ever since, as may be seen in Table XV. In the depression of 1929–32, exports dropped from more than $5,000,000,000 to less than $2,000,000,000; by 1940 they had recovered only to $4,000,000,000. During World War II they reached a peak of nearly $17,000,000,000 in 1944, approximately three-fourths of which was accounted for by lend-lease shipments. After World War II, in addition to ordinary exports, shipments of military goods were made under aid programs. These were not large in amount until 1951, when they totalled more than $1,000,000,000; in 1953 they totalled $4,000,000,000. Even excluding these shipments, exports exceeded imports.

Imports were even more adversely affected by the depression of 1929–32 than were exports. Imports dropped from over $4,000,000,000 to somewhat more than $1,000,000,000. A sharp drop in imports also occurred with the recession of 1937–38, from $3,000,000,000 to $2,000,000,000, and even the relatively mild recession of 1949 brought a drop in imports from $7,500,000,000 in 1948 to less than $7,000,000,000 in 1949. Fluctuations in imports in dollar terms have been greater than fluctuations in gross national product, and even minor business recessions have resulted in substantial declines in dollars available to foreign countries from sales of goods to the United States. In the short run, changes in imports are closely related to changes in gross national product (although dropping more sharply), but in the long run there has been a decline in the ratio of imports to gross national product; this ratio dropped from over 7% of GNP in the 1870s to less than 3% in 1946–50.

Merchandise exports exceeded merchandise imports every year after World War I as reported by the census bureau, although if silver shipments are included (as is done in balance of payments data) this was not true in 1935 and 1936.

Principal Imported Commodities.—More than half of the total value of United States imports was accounted for in 1952 by ten commodities or groups of commodities: nonferrous metals and ores, coffee, newsprint, sugar, crude rubber, raw wool, crude petroleum, wood pulp, cocoa and burlaps. As is evident from this list, crude and manufactured foodstuffs are important in total imports. Imports of crude foodstuffs were higher after World War II than in prewar years, partly because of a substantial increase in per capita consumption of coffee. Imports of manufactured foodstuffs increased much less, partly because of the introduction of sugar import quotas under the Jones-Costigan act (1934) and later Sugar acts (1937 to 1948).

Shifting consumer demand and technological developments caused changes in fibre and textile raw material imports—imports of raw silk and of burlaps declined (reflecting the increased use of such substitutes as synthetic fibres and paper bags) and imports of wool, which increased until 1951, dropped thereafter. On the other hand, increased demand, combined in some cases with a decline in available domestic supplies, caused an increase in imports of copper, lead, zinc, tin and crude petroleum. Imports of finished manufactures increased sharply in 1950 and 1951, and somewhat in following years. The sharp increases followed the currency devaluations of 1949, which reduced dollar prices of some of these products. Some statistical studies suggest that United States demand for many finished manufactures is highly elastic with respect to price, and therefore increase in such imports may

depend upon the extent to which foreign productivity increases and monetary policies keep prices low enough to be competitive.

Leading Export Commodities.—Industrial semimanufactured and finished products accounted for about two-thirds of the total value of U.S. exports, followed by agricultural crude materials and foodstuffs, which accounted for about 20%, and manufactured

foods, about 6%. Foodstuff exports rose very sharply during World War II and in the immediate postwar period.

Exports of some mineral and metal products declined as demand in the United States increased and as domestic supplies became less adequate to meet total demand. By 1956 capital equipment and producers' supplies and materials constituted three-fourths of total exports. The percentage increase in exports of capital equipment over levels of the 1920s and 1930s was exceptionally large; during the postwar period large exports of capital equipment were made to such areas as Canada and Latin America. After World War II Canada superseded the United Kingdom as the leading market for United States exports.

Although values of exports of consumer goods other than foods and drugs increased from their levels in the 1920s and 1930s, these exports comprised a relatively small part of the total, and showed little increase in the decade 1946–55. Partly this was because of the existence of import and exchange controls in many markets; these controls usually restrict imports of consumer goods more than other products. The percentage increase in exports of foods and drugs was not as large as that of exports of capital equipment, but such exports approximately tripled in value from 1926 to 1956, as new major markets for foodstuffs became important after World War II. Japan was the leading overseas market for United States food shipments in 1955.

Percentages of the cotton and tobacco crops exported declined markedly, accentuating the shift from agricultural to nonagricultural exports. A smaller percentage of the output of passenger cars were also exported than before World War II. On the other hand, such industries as the civilian aircraft industry exported increasing percentages of total production, and a greater share of the output of machinery was exported than before World War II.

Sources and Destinations of Foreign Trade.—In the years 1876–80 more than half of the United States's imports of merchandise came from Europe, while 83% of all exports went to Europe. Other countries on the North American continent supplied 23% of all United States imports and absorbed 10% of all merchandise exports. Latin America supplied 31% of all imports and purchased nearly 9% of all exports. Asia was a source of supply of 11% of imports, but took less than 2% of exports. Since that time Europe has become a relatively less and less important source of supply, and a comparatively smaller market for exports. By 1929 Europe supplied only 30% of United States imports, and only 27% in 1937. Exports to Europe dropped to 45% of the total in 1929, and to approximately 40% in 1937. This decline in exports to Europe was caused chiefly by a decline in the importance of the United Kingdom as a market for United States exports. Especially after World War II, because of the dollar shortage the United Kingdom purchased a greater proportion of its imports from the sterling area.

World War II caused other important shifts in United States foreign commerce, with a substantial increase in trade with Canada and Latin America. Canada and the Latin-American republics, which took only one-third of U.S. exports in 1936–38 and supplied only slightly more than that proportion of imports, were the destinations of 40% of all exports in 1951–55 and the source of more than half of all imports.

Exports to Asia increased much more than imports from Asia. The decline in raw silk imports, the disturbed political conditions in many parts of Asia and the increase in population (especially in Japan) which necessitated increased imports all were factors. Exports to certain areas, such as Korea, Formosa (Taiwan) and Vietnam, were financed by government aid necessitated by the economic difficulties of those areas. Some shipments to India and Pakistan were also made under special government programs, but the increasing importance of these countries as markets was also attributable to their new political status and programs of economic development.

"Invisibles."—The so-called "invisible" items in United States foreign commerce, including receipts and payments for transportation services, travel and tourist expenditures, miscellaneous services and income on investments, are important items in the U.S. balance of payments. In 1955 these items accounted for approximately 25% of the total value of exports of goods and services, and for approximately one-third of the total value of imports of goods and services. Between World Wars I and II payments generally exceeded receipts, and although this situation was reversed from 1940 to 1952, beginning in 1953 there was again an excess of payments over receipts. An important component of total payments was expenditures of United States armed forces abroad—expenditures of members of the armed forces themselves, and expenditures for construction of airfields, support of troops, etc. These expenditures totalled $2,500,000,000 in 1953, and were increasing in following years. In spite of heavy subsidies of the U.S. merchant marine, foreign competition was significant, and after 1951 transportation payments were not much lower than receipts. Expenditure of U.S. tourists abroad did not increase nearly as rapidly as the increase in personal disposable income from the 1920s to the 1950s, but such expenditures exceeded $1,000,000,000 in 1954. The substantial growth of United States foreign investments resulted in an inflow of income which in 1955 reached $2,500,000,000. This was nearly twice as large as the net outflow of United States capital that year.

Unilateral Transfers.—Some unilateral transfers have always been made in the form of remittances and gift shipments. During World War II, however, unilateral transfers became a very substantial element in the United States balance of payments, exceeding $14,000,000,000 in 1944. Unilateral transfers reached $6,700,000,000 in 1953. Lend-lease during World War II, the United Nations Relief and Rehabilitation administration (UNRRA) and other aid in the immediate postwar period and the Marshall plan and its successors after 1948 provided a flow of aid funds which totalled approximately $90,000,000,000 (net) in the

15-year period 1941–55. This aid made possible and financed a large part of the surplus of exports over imports of goods and services. Private remittances amounted to approximately $500,000,000 annually.

Capital Movements.—The net outflow of private capital from the United States, which had been relatively sizable during World War I and during the 1920s and which reached $1,500,000,000 in 1928, dropped sharply in the depression of 1929–32 and thereafter did not recover until after World War II. The outflow of capital, both government and private, during the years 1931–45 was negligible; the international financial collapse of 1931 and the depression, together with political and military uncertainties, made potential investors hesitant. After World War II foreign investment began to revive, but most of such investment was direct investment in branch plants and similar productive facilities rather than the purchase of foreign securities. Most of this foreign investment was made in Canada and in Latin America, with investment in the middle east (chiefly by oil companies) ranking third. Although by 1952 the outflow of private capital was almost as large in dollar terms as in 1927–28, its increase was far less than that in private domestic investment. Lack of knowledge on the part of business executives concerning foreign investment, the restrictions imposed by countries resentful of foreign influence and insufficient earnings differentials hindered the expansion of foreign investment. Thus private capital financed only a small part of the export surplus; and in 1954 and 1955 repayments exceeded the outflow of government long-term capital. It remained to be seen whether (if foreign aid were eliminated) means could be found to encourage a substantial outflow of capital to finance part of the export surplus and maintain U.S. exports at the high level of nearly $19,000,000,000 reached in 1956.

Commercial Policy.—The major instrument of commercial policy of the U.S. has been the tariff, although import quotas, subsidies to shipping and other measures have had some importance. Because of the strength of the dollar vis-à-vis other currencies, the United States has never imposed the exchange controls or negotiated the clearing agreements which have been features of the commercial and international financial policies of many countries.

The first United States tariff act (that of 1789) was primarily for revenue, but it contained certain elements of protection. Duties on exports were prohibited by the constitution, but import duties became an important feature of United States law. Alexander Hamilton gave the classic arguments for protection in his *Report on Manufactures*, and after the War of 1812 the movement for protection grew as manufacturing interests increased in strength. From 1832 until the time of the Civil War the south succeeded in reducing duties, but this trend was reversed by the Morill act of 1861. During the Civil War the tariff was used as one of many means of raising revenue; the high protective tariff was firmly established in the act of 1864.

With the election of Woodrow Wilson in 1912, the Underwood tariff of 1913 made some reductions in duties, although other rates were raised. When the Republican party returned to power in 1920 an upward revision of the tariff was made in an emergency act of 1921, followed by the Fordney-McCumber act of 1922. The Smoot-Hawley Tariff act of 1930 raised rates still further. These acts adopted the principle that duties should offset the lower costs of foreign producers, a principle which, if carried to its logical conclusion, would eliminate much of international commerce. The Smoot-Hawley Tariff act was followed almost immediately by tariff increases in many other countries.

Reciprocal Trade Agreements Program.—No tariff act was passed by congress after 1930. The precipitous decline in world trade which accompanied the depression of 1929–32 and the spread of trade restrictions, especially after 1931, provided a basis for reconsideration of tariff policy. The Trade Agreements act of 1934 empowered the president to enter into agreements with foreign countries, reducing (or raising) U.S. import duties by not more than 50% in exchange for tariff changes by foreign countries. This act was renewed nine times to 1955, with some modifications. The renewal in 1949 included a "peril point" provision which required the president to explain to congress any reductions in duties below points designated by the tariff commission as likely to injure domestic industries, and that in 1951 included an "escape clause" provision which required him to withdraw concessions found by the tariff commission to be injurious, or to explain to congress his reasons for not doing so. The renewal in 1955 permitted reductions of 5% a year for each of the following three years, and reduction of any duty above 50% ad valorem to that level.

Tariff reductions under the reciprocal trade agreements program resulted in reduction of duties collected from 53% of the value of total dutiable imports in 1930–33 (under the Smoot-Hawley rates) to 13% in 1952. Calculations of average rates, however, cannot adequately measure the restrictiveness of tariffs. Many reductions are made just to the point at which substantial increases in imports might result; the administrative provisions and valuation practices are often significant barriers; and reduction of a duty may not have as much effect as its imposition. Once trade channels have been disrupted, it may be difficult to re-establish them. In any event, the reciprocal trade agreements program has not resulted in unusual increases in imports which, although increasing absolutely, have declined both in relation to exports and in relation to gross national product.

General Agreement on Tariffs and Trade.—In 1947 a new procedure of tariff negotiation was used; concessions were agreed upon by pairs of countries, and then incorporated in a single General Agreement on Tariffs and Trade (G.A.T.T.). Concessions in this agreement

were made applicable to all signatory countries. These and subsequent concessions negotiated at Annecy, Fr., in 1949, Torquay, Eng., in 1951 and Geneva, Switz., in 1955 superseded bilateral concessions; most significant concessions under the trade agreements program thus became embodied in the General Agreement on Tariffs and Trade. A charter for an International Trade organization (ITO), which would have provided for reduction or elimination of trade barriers, was never adopted, primarily because the United States congress did not ratify it; but G.A.T.T. continued in force and periodic meetings of the contracting parties performed some functions of an international trade organization. President Eisenhower supported the establishment of an Organization for Trade Cooperation (O.T.C.) to provide formal machinery to administer G.A.T.T. more effectively; this proposal was under consideration in congress in 1957.

Quotas.—The United States has not made extensive use of quotas, but they have been of some importance on certain agricultural products. Quotas for sugar imports were established under the Jones-Costigan Sugar act of 1934, and quotas for such products as wheat, wheat products, flaxseed, peanuts, butter and other dairy products, fats and oils and rice have been established by the secretary of agriculture under authority of the Agricultural Adjustment act, adopted in 1935. The conflict between agricultural policy and trade policy has given rise to serious problems of over-all foreign commercial policy.

Foreign Trade Zones and Customs Simplification.—Administrative provisions of tariff acts can be equally as effective as duties themselves in creating obstacles to imports. Such things as delay and uncertainty in classification of merchandise, valuation procedure and marking requirements have been extremely important as "invisible tariffs."

One effort to aid foreign commerce was the Foreign Trade Zones act of 1934, which provided for foreign trade zones in which goods might be sorted, graded and manipulated and then re-exported without being entered through customs, or might be entered after such handling. In 1950 manufacturing and exhibiting were authorized in such zones. Importers may eliminate damaged goods (which then need not be entered through customs), modify goods (making them subject to a lower rate of duty) or store goods in a zone pending entry. Six zones were established by 1950: in New York city, New Orleans, La., San Francisco, Calif., Los Angeles, Calif., Seattle, Wash., and at the municipal airport at San Antonio, Tex. The San Antonio zone ceased operating in Oct. 1953, and the Los Angeles zone in Jan. 1956.

The Customs Simplification act of 1953 changed many administrative provisions so that unnecessary marking requirements, delay in entry, harsh penalties and accounting procedures might be eliminated, reduced or simplified. The Customs Simplification act of 1956 provided for use of "export value" for valuation of most goods subject to ad valorem duties; previously the law required the use of export value or foreign value (basically the wholesale price in the foreign country of exportation), whichever was higher.

VIII. DEFENSE

ARMY

When George Washington took command, on July 3, 1775, of the lines of colonial militia besieging Boston, Mass., the United States army was born. Although it was still a year and a day before the Declaration of Independence, the event marked the union of the forces of the 13 separate Colonies under one head. These men were largely militia and minutemen of local communities, given to going home whenever a particular danger was past. In Jan. 1776 the Continental Congress wisely decided that the troops it had directly raised and equipped should be separate in organization from those of local communities. These "Continentals" were enlisted for longer terms, were trained more thoroughly and thereafter provided Washington with a small but comparatively more stable nucleus with which to work, and they proved his chief reliance in the dark hours of the war. They were the beginning of a regular army.

Washington's force varied from 8,000 troops in the operations around New York to as low as 4,000 after the winter at Valley Forge and as high as 26,000 in Nov. 1779. Other generals seldom had more than 6,000 men at their command, while some of the most important work of the war was done by bands of a few hundred under Thomas Sumter on the Catawba, Francis Marion in the Peedee swamps and George Rogers Clark in the northwest.

When peace was declared, congress ordered the disbandment of the entire army except "twenty-five privates to guard the stores at Ft. Pitt and fifty-five to guard the stores at West Point." Indian disturbances on the frontier soon caused an increase, and, when Washington was inaugurated president, the number of men in service was 595. Until 1812 the army passed through swift periods of rise and fall, an index of national fear. From a bare single regiment when the constitution went into force, it changed to 2 in 1779, 3 in 1791, 6 in 1796, 9 in 1798, 6 in 1800, 3 in 1802, 11 in 1808, though the number authorized was always much higher than the number actually in service. Under stress of the War of 1812 the army increased from 21 regiments in Jan. 1812 to a paper strength of 51 regiments a year later, though it is doubtful if a sixth of the authorized 58,000 men were ever recruited. Counting militia and local combatants, possibly 60,000 men at the most served during the war.

The regular army was reduced to 6,600 by 1820, the artillery stationed largely in the coast fortifications and the infantry in the northern, western and southern frontier posts. Just before the Mexican War the army had shrunk to an actual strength of 5,300 men, occupying more than 100 posts. When war was declared, the regular army was recruited to war strength, and about 20,000 volunteers responded to the call, many of whom had to be sent home again because they could not be outfitted. About 20,000 troops took part in the war altogether, Winfield Scott having about 10,500 with him in the Valley of Mexico. In 1848 the troops were reduced to 8,000, scattered over the immense area to which the country had grown. The task of dealing with the Indians in the far west increased the army to a strength of 12,698 men by 1855, which it retained up to the Civil War.

Civil War to World War I.—Enlistments in the Federal army during the Civil War numbered 2,898,304, including re-enlistments. The number in service at one time was probably a little more than 1,500,000. Estimates of the men in Confederate service varied from 700,000 to 885,000. Reduction on the usual scale in the regular army was impossible after the Civil War because of the large number of troops (about 19,000) stationed in the south to support the military governments of the Reconstruction period, because of the threat of Maximilian in Mexico which sent Philip Sheridan to the border with a large command and because of increased Indian outbreaks in the west during the Civil War and immediately afterward. The act of 1866 provided for a regular army of 54,000 men paper strength. The actual strength was 38,540 men, which decreased until in 1878 the effective strength was less than 20,000 men. The force was well trained, however, because it saw almost constant service against the Indians in the west. At the beginning of 1896 the army numbered slightly less than 25,000 men, the smallest force in proportion to the total U.S. population at any time since the Revolutionary postwar period. Calls for volunteers in the Spanish-American War increased the army to 216,029 men on Aug. 31, 1898. An act in 1899 authorized the president to keep the strength of the regular army at a maximum of 65,000, and in 1901 the allowable maximum was raised to 100,000. (X.)

Following the Spanish-American War the army launched upon a slow but increasingly accelerated struggle to bring itself up to the forefront as a military organization. To what extent this goal was achieved was demonstrated upon the entrance of the United States into World War I in the spring of 1917. While modernization of equipment and specialized training of troops had much to do with the army's progress, two radical changes in the military organization during the first decade and a half of the 20th century had a lasting effect upon the defense establishment. The first was the establishment of a general staff corps in 1903 which provided for a policy-making group of officers to co-ordinate the specialized activities of infantry, artillery and other arms and services, and to act as a liaison organization between the field soldiers and the secretary of war and members of his civilian staff. The second, occurring in 1914, was congressional authorization for an aviation section of the U.S. army signal corps. This was the beginning of the United States air force, a sister service holding comparable rank with its historic predecessors, the army and the navy.

World Wars I and II.—After the experiences gained by the concentration of a big segment of the regular army and the mobilization of the national guard for duty on the Mexican border in 1916, and in view of the threatening aspects of the war in Europe, which had been in progress since the summer of 1914, the U.S. government realized the

necessity of building up its military strength as rapidly as possible. On June 3, 1916, congress passed a national defense act which raised the authorized strength of the regular army to 287,846 officers and enlisted men and provided for a reorganized military establishment which included the national guard, the organized reserve corps and a volunteer, or emergency, army.

The dress rehearsal for the army's participation in World War I started with the mobilization of the bulk of the regular establishment and the national guard in 1916. During the war the army grew from 100,000 officers and men to 4,000,000—up until then a high-water mark of U.S. military manpower. Approximately 2,000,000 soldiers went to France under the leadership of Gen. John J. Pershing and joined forces with the French, English and other Allies to crush the Central Powers in a struggle that was primarily a trench war of relatively fixed positions.

After World War I the U.S. army experienced the usual contraction that had followed in the wake of every other conflict in which it had taken part. In World War I approximately 75% of the personnel requirements of the army were met through conscription as provided by the Selective Service act of May 18, 1917. Another big percentage came from the citizen soldiers who comprised the national guard and those who enlisted "for the duration." With the advent of World War II, the army again went through the process of expanding from a force of about 200,000 regulars and a national guard of about the same size to an organization of more than 8,000,000 at peak strength. Its main component parts were the army ground forces, the army air force and the army service forces.

World War II experiences, from the outset, pointed out new lessons as well as new experiences for the U.S. people; and the combined political, economic, industrial, diplomatic and military representatives of the nation began to make adjustments and rearrangements in the over-all defense organization even before the war drew to a close. Technological progress, electronic developments, atom- and hydrogen-bomb advancements, guided-missile inventions, aircraft perfection and other world-shaping factors contrived to "shrink" the U.S.'s protecting oceans on the east and the west. Previously, the army's history had been one of great expansion in time of emergency upon a mainland protected from attack by two wide water areas and supported by friendly neighbours, only to contract after each national crisis had been met and overcome. World War II pointed up the fact that homeland security could no longer depend entirely on the protection of geography, nor could national interests remain centred exclusively in its particular section of the North American continent.

The new era of fast intercontinental transportation imposed upon the nation's military leaders a new concept of security which called for plans that would effect an extremely rapid mobilization of a strong, well-trained, modernly equipped army, as well as a full industrial and civilian mobilization to back up the fighting forces.

The Army at Mid-20th Century.—Forced into an accelerated program of implementing its revised plans and policies by the large burden assumed by the United States in the United Nations' intervention in Korea, the mission of the army at mid-20th century was threefold in its major aspects. The first was constant preparation to maintain by timely and effective military action on land the security of the continental United States, its possessions abroad and other areas vital to its interests. Second was the formulation of workable plans for organizing, training and combining with allied forces for land operations. Third was the development of organization, tactics, techniques and equipment for use by army personnel in amphibious and air-borne operations. These were the missions enumerated by the National Security act of 1947, the Key West and Newport agreements among the armed forces and the National Security act amendments of 1949.

Under the provisions of the Armed Services Unification act of July 26, 1947, the air force was established as a separate organization and was divorced from the control of the United States army. The same act created the national military establishment (later called the department of defense), in which the secretaries of the army and the navy relinquished presidential cabinet status and, along with the secretary of the air force, reported to the secretary of defense instead of directly to the president.

At mid-century the U.S. army was reorganized in accordance with the provisions of public law 581 passed by the 81st congress on June 28, 1950. This law, known as the Army Organization act of 1950, established the civilian control, the military directorate and the component elements of the nation's ground fighting service. Under the act, the army's civilian head is the secretary for the army. His immediate assistants are an undersecretary of the army and five assistant secretaries. The military head is the chief of staff. He is the chief of the general staff and reports directly to the secretary of the army. On the immediate staff of the chief are a vice-chief, four deputy chiefs and a comptroller.

In addition, there are four assistant chiefs of staff, each having supervision over a major element of the army organization. The assistant chief of staff, G-1, is in charge of personnel. Reporting to him are chiefs of the administrative services: the adjutant general, the provost marshal general and the chief of chaplains. G-2 directs military intelligence activities. G-3 heads planning and operations. G-4 is the logistics chief and reporting to him are the heads of the technical services, which include the chemical, medical, quartermaster, ordnance, transportation, engineer and signal corps. The administrative and technical services listed above were included in the army service forces during World War II. While the signal corps and the corps of engineers are generally considered to be technical services, they are also classified as an arm, or combat branch, because they carry out missions as combat troops as well as engage in procurement, development and research.

Each of the three combat arms provided for under the reorganization act—infantry, artillery and armour—is especially equipped and trained for its specific type of work. Training of troops in the field is the responsibility of the chief, continental army command. In the training programs emphasis is placed on teamwork with other arms and with elements of the sister services. The results of the training are tested in combined manoeuvres and exercises held at frequent intervals.

Territorial Organization.—The continental area of the United States at mid-20th century was divided into six army areas, plus the military district of Washington (D.C.), as follows:

1. 1st army, with headquarters at Governor's Island, N.Y., and consisting of the New England states, New York and New Jersey.

2. 2nd army, with headquarters at Ft. George G. Meade, Md., including Delaware, Pennsylvania, Maryland, Virginia, West Virginia, Kentucky and Ohio.

3. 3rd army, with headquarters at Ft. McPherson, Ga., and including North and South Carolina, Georgia, Florida, Tennessee, Mississippi and Alabama.

4. 4th army, with headquarters at Ft. Sam Houston, Tex., and including Texas, New Mexico, Louisiana, Arkansas and Oklahoma.

5. 5th army, with headquarters at Chicago, Ill., and including Illinois, Michigan, Indiana, Wisconsin, Minnesota, Iowa, Nebraska, Kansas, Missouri, Wyoming, Colorado and North and South Dakota.

6. 6th army, with headquarters at the Presidio of San Francisco, Calif., and including California, Oregon, Washington, Montana, Idaho, Utah, Nevada and Arizona.

Outside the continental limits of the United States the army had specific missions carried out by the following commands: U.S. army, Caribbean; European command, including 7th army; southern European task force; far east command; U.S. army, Alaska; and U.S. army, Pacific.

Combat Organization.—The basic combat organization in the field is the division. It is the smallest fighting team that contains representation of all the arms and most of the services and is capable of sustaining itself over an extensive period of time in combat. Divisions are of three types—infantry, air-borne and armour—depending on the type of troops that make up the main element of the organization. An infantry division, for example, consisted at mid-century of three infantry regiments (the major element) supported by five battalions of artillery, a tank battalion and an engineer combat battalion, a reconnaissance company, a signal company and the necessary service and supporting units.

The United States's strong military leadership and participation in the United Nations' action in Korea, which began in the latter part of June 1950, provided a realistic combat test for the organizational setup as well as the equipment and techniques of the country's land warfare establishment—just as the mobilization of the army along the Mexican border in 1916 provided a proving ground for the evaluation of the national strength prior to World War I. For three years after the Korean campaign ended, the structure and training doctrine of the army remained virtually unchanged, while study continued on the tactical lessons of that conflict and of the impact of atomic weapons on land forces and the form of land warfare.

The first general army-wide conference on the requirements of the future, dictated by main weapons changes, was held in 1956. One result was to popularize within the army the feeling that the great part of its combat power should be made air transportable over strategic distance if it was to continue as an efficient instrument of national policy. This easily stated goal remained unattainable for reasons of cost and the necessity of supporting other main programs.

Within the following year, however, nearly absolute reform was initiated in yet another direction. While the division was continued as the basic self-maintaining field unit, all of its components, its weapons, methods of operation and systems for supplying and communicating were fundamentally changed.

The reform was called the Pentana concept. Instead of a tight and mutually supporting triangle composed of three infantry regiments, the division became a much looser, but more flexibly mobile manoeuvre body consisting of five infantry "battle groups." Battalions were also dropped from the infantry structure. Each battle group was formed of five double-strength companies, thus eliminating one layer of command.

Not less radical was the reform of the supporting fire structure. Organic artillery within the division was cut to two battalions to make room for rocket batteries while artillery mortar batteries became integral in the rifle battle groups. The aim of this revision in gun power was to substitute atomic missiles for artillery concentrations, thereby lessening over-all weight, increasing shock and speeding the flow of force in a form of warfare certain to be operationally fluid. Logistical support for the division became centralized in a single support group, charged to move supply for all fighting components up to the fire line. A signal battalion replaced the normal signal company serving the division because of the anticipated need for multiple lines between all

echelons of command.

As a prototype for the Pentana reform, the 101st air-borne division was reactivated in Sept. 1956 to serve as the experimental laboratory. Before its first field tests could be held to determine the practicality and limits of the new design, it was announced that all air-borne and line divisions within the army would be remoulded on the same general pattern. Manpower strength was scaled down slightly for all types of division.

Though the requisite reorganization was ordered, the weapons essential to the reform were still in short supply, the outlook being that the rearming would be more than 25% complete by 1962. As the program got under way, there were 11 combat divisions within the army, two of them air-borne, and eight training divisions. The preponderant combat strength of the army was already deployed overseas in Europe and Asia.

One other main army reform of the period sought the build-up of an adequate ready reserve and an equalization of all army training within the regular establishment and civilian components alike. It started with the passage of a reserve bill by the congress in Aug. 1955, designed to provide an easier training option for youths otherwise subject to the draft. The bill provided that the volunteer recruits would take six months training under professional instruction and periodic drill for eight years thereafter, while remaining subject to mobilization. The program was described as the essential step toward raising a ready army reserve of 2,900,000 men within five years. Before the program was two years under way, however, budget limitations forced a reduction of that figure to 700,000 men including 425,000 in the national guard. Under pressure from the army, the national guard in 1957 raised its level of recruit training to the standards of the regular service. This was the chief manpower advance from the army's effort to build a strong reserve. Throughout the period which followed the Korean campaign, the army was under constant and increasing political pressure to continue reduction of forces. Part of the pressure came from public feeling that because of nuclear weapons, armies were in eclipse and the count of trained field soldiers under arms no longer decisively influenced the military power balance between nations. (M. B. H.; S. L. M.)

NAVY

"The genesis of the United States Navy is to be found in the maritime origins and early development of the country," wrote Commodore Dudley W. Knox in *History of the U.S. Navy* (G. P. Putnam's Sons), recording that 2,342 U.S.-built vessels were included in the total of 7,694 engaged in the commerce of Great Britain in 1775. The earliest sea battles of the American Revolution were fought by small vessels armed for service by 9 of the 13 Colonies, after the battle of Lexington, and intended for the protection of local water-borne commerce.

When Washington took command of the Continental army before Boston, Mass., in July 1775, he found his troops without ammunition and arranged for a ship of the Rhode Island navy to go to Bermuda for powder. Soon afterward, Washington fitted out seven small vessels and manned them with seagoing troops in order to interfere with British supply ships. Commodore John Manly directed this force and commanded the most successful of the vessels, capturing in one British ship a quantity of munitions which was equivalent to the manufacturing capacity of the Colonies for about 18 months. On Oct. 13, 1775, the Continental Congress voted to fit out ships, and the marine committee, later appointed, sent the first Continental squadron to the Bahamas for the purpose of capturing munitions.

Congress declared all British vessels subject to capture and authorized privateering. In the aggregate, the Continental navy comprised about 60 ships and made an impressive showing. Among the former merchant seamen who commanded the ships, Esek Hopkins, John Paul Jones, John Barry, Lambert Wickes, Nicholas Biddle, Joshua Barney, Samuel Nicholson, Gustavus Conyngham, Henry Johnson and Abraham Whipple were especially competent. Jones was the hero of the most notable exploit, and his reply, "I have not yet begun to fight," gave the navy an imperishable tradition. In addition to cruising against enemy merchantmen and British blockaders, the Continental vessels were required to make many voyages carrying diplomatic representatives and essential cargoes. Arrangements for the administration of the Continental vessels were not efficient, and the shortage of money imposed severe handicaps. Privateering offered much better financial inducements, and made recruiting difficult. Together the Continental navy and the privateers touched the pocketbook-nerve of British merchants and each one of the many petitions to the king praying for ending of the war stressed the severe losses which the English mercantile community was suffering.

In 1776, after their retreat from Canada, Benedict Arnold and his troops built a flotilla of small vessels on Lake Champlain. Ships of the royal navy in the St. Lawrence river contributed trained men and enabled the British to outbuild Arnold and to destroy his vessels off Valcour Island in Oct. 1776, in the only "fleet" action involving Americans during the war. Arnold had so delayed the British, however, that they were unable to advance southward until 1777, by which time Washington and the Continental Congress were able to assemble the army which captured Gen. John Burgoyne at Saratoga, N.Y. This victory led to the alliance with France.

The royal navy enabled the British army to reduce Savannah, Ga., Charleston, S.C., and Wilmington, N.C.; it ravaged the coast of Connecticut, burned Norfolk, Va., Falmouth, Me., and other coastal towns while enabling the British army to strike at will along the seaboard. By 1778 Washington realized that he needed a superior French fleet to enable him to inflict a truly decisive defeat on the British, and thereafter he constantly urged on Benjamin Franklin in Paris the need for ships rather than French troops. In the battle of the Capes of Virginia, Sept. 5, 1781, a powerful British fleet was defeated by the comte de Grasse. The presence of the French fleet prevented the royal navy from rescuing the British from the Yorktown peninsula, and Washington forced the surrender of Lord Cornwallis. After the Revolution the Continental navy was disbanded and the vessels sold. The first congress, under the constitution, provided for an army but decided that a navy was not necessary. Destruction of U.S. commerce by the Barbary states caused congress to authorize the building of six frigates in 1794 and to establish the navy department in 1798. Successes in the quasi-war with France in 1798 and in the Barbary Wars gave Thomas Truxtun, Edward Preble and Stephen Decatur national reputations and provided the young navy with experience and self-confidence.

The War of 1812 grew out of British impressment of U.S. seamen and other grievances connected with U.S. commerce. New England was not enthusiastic about the war, while the whole country was disappointed by the U.S. army's failure to occupy Canada. The overwhelming size of the British navy made possible a damaging blockade of all principal ports, enabled the British to capture and burn Washington, D.C., to attack Baltimore, Md., New Orleans, La., and various coastal towns, while driving U.S. shipping from the seas. U.S. victories in a number of frigate actions were helpful in keeping up the national spirit; they added to the prestige of the navy and to the reputations of John Rodgers, Charles Stewart, Isaac Hull and David Porter. Thomas Macdonough defeated a British squadron on Lake Champlain and prevented an invasion. Oliver Hazard Perry captured a British naval force on Lake Erie, thus forcing British troops out of Ohio and Detroit, and preserving the states to the westward. These timely naval victories on the lakes made possible the favourable peace terms of the treaty of Ghent.

Between 1815 and 1861 the U.S. navy appeared in seaports all over the world, assisted commerce, made treaties in the near east and far east, explored and surveyed unfamiliar areas, conducted many scientific expeditions and had a major share in ending piracy as well as suppressing the slave trade. The Naval academy was established in 1845 by George Bancroft, the historian, then secretary of the navy.

In the Mexican War, 1846–47, the navy took over California and administered the government, besides escorting and landing the army at Vera Cruz for the capture of Mexico City.

When the Civil War began in 1861, the navy had about 10,000 officers and men and 90 ships. Only 42 of these ships were in commission and only 12 in the home squadron. Many able and experienced officers "went south" and built the Confederate navy, with the assistance of about 2,000 guns and 11 ships captured with the Norfolk navy yard. On April 19, 1861, Pres. Abraham Lincoln proclaimed a blockade of all southern ports. To many it seemed absurd to propose to blockade 3,000 mi. of seacoast with a small navy. Secretary of the Navy Gideon Wells, ably seconded by Gustavus Fox, assistant secretary, started immediately at the mouth of the James river, and before the end of Dec. 1861 more than 150 ships had been captured in attempting to evade the blockade. In November Adm. Samuel du Pont took Port Royal sound and established a base for blockading vessels. The blockade isolated the Confederate states, cut off overseas supplies of munitions and was the most decisive factor in the Union victory. On Nov. 7, 1861, Mississippi river gunboats assisted in a victory at Belmont, Mo., and close co-operation between Commodore Andrew Foote of the navy and Gen. Ulysses S. Grant began. The navy closed the Mississippi to Confederate use and cut off the southern states west of the river. David G. Farragut distinguished himself in the capture of New Orleans, in operations on the lower Mississippi and at Mobile bay. He became the first rear admiral and later the first admiral. David D. Porter, S. F. du Pont, S. P. Lee and others also distinguished themselves in a navy which grew enormously before the war's end in 1865.

On March 8, 1862, the steam frigate "Merrimac," converted by the Confederates into an ironclad, appeared in Hampton Roads, Va., and sank two Union vessels, the "Cumberland" and the "Congress." For a time it was feared that the "Merrimac" could destroy the blockade, but on the very next day she was met by the "Monitor" in an epic fight, and she did not attack again. Southern cruisers and privateers did not destroy large numbers of Union vessels, but the actual destruction combined with the very high insurance rates ruined the U.S. merchant marine, which never recovered its previous prosperity.

Although the Union navy had been the decisive element in the Civil War, it was neglected for many years. In spite of naval stagnation the U.S. Naval institute was established in 1873, for the advancement of professional, literary and scientific knowledge in the navy. The Naval War college was established by Commodore Stephen B. Luce in 1885, and, in 1890, a member of its staff, Capt. Alfred Thayer Mahan, published *The Influence of Sea Power upon History, 1660–1783*. Mahan's writings brought him academic honours at home and abroad, and the presidency of the American Historical association in 1902.

In 1883 congress appropriated money for building four steel warships and the navy took the radical step of insisting that the steel be of domestic manufacture, thus requiring the production of better steel in the

United States. The navy assisted in two notable arctic expeditions, "Jeannette" and "Greely," and continued to foster overseas commerce. In the Spanish-American War, 1898, Adm. William Sampson and Adm. W. S. Schley defeated the Spanish fleet outside Santiago de Cuba, while Commodore George Dewey won a complete victory over another Spanish fleet in Manila bay. These two naval victories, at a cost of one man killed, practically ended the war.

The U.S. navy grew steadily in power and efficiency between 1898 and 1917. Pres. Theodore Roosevelt provided much of the impetus for the growth and aided in the national popularity of the service. He ordered a cruise around the world in 1907–08 which improved efficiency and had valuable diplomatic effects. In 1915 the office of the chief of naval operations was established, and in 1916 an important shipbuilding program, influenced largely by Japanese actions, was begun. During World War I, U.S. naval vessels did not participate in any sea battles, but the navy was expanded eightfold and performed many important duties. The sea power of Great Britain, seconded by French and Italian fleets, had prevented a German victory in spite of the successes of the German armies. In April 1917, just after the U.S. entry into the war, German submarines were sinking Allied merchantmen at an alarming rate, but the assistance of U.S. destroyers, the adoption of the convoy system and a huge shipbuilding program in the U.S. overcame this threat. The navy laid an enormous anti-submarine mine field in the North sea, sent a battleship division to join the British grand fleet and a second division to Bantry bay to guard against heavy raiders, sent a naval aviation bombing squadron to France, provided a battery of heavy guns on railway carriages for the western front and transported more than 1,000,000 troops to France.

World War II.—After the beginning of World War II in 1939, the U.S. navy began a huge building program of planes, warships, merchant ships, landing craft and various special types. A patrol was instituted in the Atlantic in 1939, Iceland was occupied in 1941 and the escort of convoys began in 1941. After the disastrous Pearl Harbor attack of Dec. 7, 1941, the U.S. navy helped seize French Morocco in Nov. 1942, and landed U.S. troops in Morocco and Algiers. It furnished sea and naval air strength for the seizure of Sicily, Salerno, Anzio and southern France. While combatting German undersea warfare in the Atlantic, the navy furnished convoy escorts and special search groups including aircraft carriers, planes, destroyers and special anti-submarine vessels. In the Normandy landings of June 1944, the navy supplied large numbers of amphibious ships, landing craft, etc., as well as combat ships for fire support for troops. The German generals Erwin Rommel and Karl von Rundstedt reported, at the time, that the close fire support delivered by war vessels was decisive in aiding U.S. troops to seize and hold positions. After the Pearl Harbor attack, Japanese amphibious forces made landings in Malaya, the Philippines, South Pacific islands, New Guinea and the Netherlands Indies. Early in 1942 the Japanese were building up Rabaul as a great base and on May 8, 1942, in the battle of the Coral sea, fought by carrier planes, the U.S. navy checked the Japanese in their expansion southeastward. On June 4, 1942, the decisive battle of Midway was fought. Japanese battleships, cruisers, destroyers and submarines, as well as amphibious vessels, were in the area, and U.S. cruisers, destroyers and submarines; but the heavy blows were struck by carrier planes, and Japan lost its four best carriers together with all their planes and almost all their pilots. The U.S. navy suffered heavy casualties among carrier pilots and lost one of three carriers present, but to the Japanese the result was devastating.

Both the U.S. and Japanese navies had done far more than other navies in integrating aviation in their fleets. Japan began the war with excellent carriers and well-trained carrier pilots. The heavy losses in pilots at Coral sea and Midway were augmented in the battle of Santa Cruz and by misusing carrier pilots on shore at Rabaul later on. In consequence, Japan never replaced its "first team" of carrier pilots. In Aug. 1942 the U.S. marines landed on Guadalcanal in the Solomons, and this area became a battleground for six months. The naval battles of Savo Island, eastern Solomons, Cape Esperance, Santa Cruz, Guadalcanal and Tassafaronga were costly to the U.S. navy but even more costly to the Japanese. Later, the U.S. navy, with amphibious, carrier task forces and gunfire support forces, fought westward through the Solomons, Bismarcks, Admiralty Islands, Marshall Islands and Carolines, while Gen. Douglas MacArthur's troops were working westward on New Guinea. On June 15, 1944, Adm. R. A. Spruance struck the inner ring of Japanese defenses by landing marines on Saipan, and on June 19 fought the battle of the Philippine sea, which resulted in a further heavy loss of Japanese carrier pilots and planes, as well as two Japanese carriers sunk by submarines. In anticipation of heavy attacks by planes coming from the westward, Spruance placed battleships, cruisers and destroyers in position many miles from his more vulnerable carriers, under Adm. Marc S. Mitscher, and suffered only minor damage to his ships. Other important battles, involving large forces, were fought at Lingayen gulf, Iwo Jima and Okinawa. The battle for Leyte gulf, fought Oct. 25, 1944, and involving three important separate engagements, was one of the decisive naval victories of the war, along with Midway and the Philippine sea. Sea power was decisive in the Pacific, bringing Japan to impotency by destroying its merchant marine through submarine warfare, destroying its fleet and leaving great bases like Rabaul and Truk with large garrisons to die on the vine, throttled by U.S. naval control of the seas and the air above them. Adms. E. J. King, C. W. Nimitz, W. F. Halsey, R. A. Spruance, H. K. Hewitt, T. C. Kinkaid and R. K. Turner gained fame by their successes (*see* also World War II).

Immediately following World War II, navy development began to conform to the final lesson of that conflict, that all military forces serving the major powers must have a preponderant capability with atomic weapons. Navy doctrine presupposed that the new age had not diminished the ancient authority of sea power but did require a radical overhaul of its floating combat structure.

World War II had proved that the main weapon of sea forces during the first half of the 20th century, the battleship, was no longer of decisive use because of the ascendancy of air power, land-based and carrier-based. The heavily armoured, heavily gunned but relatively sluggish battleship had no real utility within navy task forces and fleets which, striking at great speed over long range, were built up around the fast-moving carriers, covered by screens of cruisers and destroyers.

The essential idea controlling all navy reform was that the fleet must be rebuilt to keep the seas under attack in any form while carrying atomic warfare against the most distant shore. The conversion program was necessarily slowed by the technical complexity of the problem and budgetary limitations. At mid-century the navy was under equal pressure to modernize and to economize. While part of the fleet was being moth-balled to save money, the first experiments were run to prove that the cruiser is a suitable launching platform for guided missiles fitted with atomic warheads. Later, certain cruisers were converted into rocket ships. Of greater import was the construction of the U.S.S. "Nautilus," the first atomic-powered submarine. The "Nautilus" proved capable of cruising 50,000 mi. without refuelling or overhaul. This range, more than her extraordinary speed and ability to run submerged indefinitely, infinitely extended the horizon for all sea power.

The unqualified success of the "Nautilus" established as an ultimate goal for the navy that all main fighting craft should be similarly powered. That attainment was far distant in the mid-1950s because of the costs of rebuilding. The atomic age had superinduced a trend toward supercarriers of the U.S.S. "Forrestal" class. The price of one vessel would have sufficed for a fleet in the early part of the century.

To conform with the weapons revolution, the indicated tactical change lay in a search for new dispersal systems whereby the fleet could be made more elusive under atomic attack, with its components scattering swiftly to achieve better individual concealment. All progress toward this end was perforce closely guarded by security regulations.

Being in early development, the modernization program was not importantly reflected in navy operations during the Korean conflict, 1950–53. Throughout, the navy remained unopposed by enemy sea power, and its only interference came from weak shore batteries, marine mines and occasional planes. Its vessels therefore moved with relative freedom where needed to assist land operations. One novel result was a continuing close support of the army combat line by carrier-based navy aviation.

In the decade which followed World War II, while the fundamental mission of the navy remained unaltered, the manner of its execution became transformed dramatically. This change came of U.S. leadership in the forming of the system of free-nation alliances with the object of containing Communist military power in Europe and Asia. In the pre-World War II period, navy power was based at home and its peacetime operations were in the main confined to home waters. Under the postwar policy, the preponderant parts of its striking force deployed to distant waters where they could exert, by their presence, a continuing restraining influence. One fleet became based on Formosa, another on ports of the Mediterranean and other task forces patrolled the contiguous waters. The rebuilding and resupplying of these deployed forces, toward preparation for full-scale atomic war, continued.

IX. CONSTITUTION AND GOVERNMENT

The following pages contain the constitution of the United

States and the 22 amendments (with dates declared effective).

CONSTITUTION OF THE UNITED STATES OF AMERICA

PREAMBLE

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

Article. I.

Section. 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Section. 2. The House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

No Person shall be a Representative who shall not have attained to the Age of twenty five Years, and been seven Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State in which he shall be chosen.

Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons. The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies.

The House of Representatives shall chuse their Speaker and other Officers; and shall have the sole Power of Impeachment.

Section. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.

Immediately after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes. The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year, and of the third Class at the Expiration of the sixth Year, so that one third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, during the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments until the next Meeting of the Legislature, which shall then fill such Vacancies.

No Person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State for which he shall be chosen.

The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the Office of President of the United States.

The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two thirds of the Members present.

Judgment in Cases of Impeachment shall not extend further than to removal from Office, and disqualification to hold and enjoy any Office of honor, Trust or Profit under the United States: but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law.

Section. 4. The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by Law make or alter such Regulations, except as to places of chusing Senators.

The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

Section. 5. Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do Business; but a smaller Number may adjourn from day to day, and may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

Each House may determine the Rules of its Proceedings, punish its Members for disorderly behaviour, and, with the Concurrence of two thirds, expel a Member.

Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the Desire of one fifth of those Present, be entered on the Journal.

Neither House, during the Session of Congress, shall, without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting.

Section. 6. The Senators and Representatives shall receive a Compensation for their services, to be ascertained by Law, and paid out of the Treasury of the United States. They shall in all Cases, except Treason, Felony and Breach of the Peace, be privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning from the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States, which shall have been created, or the Emoluments whereof shall have been increased during such time; and no Person holding any Office under the United States, shall be a Member of either House during his Continuance in Office.

Section. 7. All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other bills.

Every Bill which shall have passed the House of Representatives and the Senate, shall, before it becomes a Law, be presented to the President of the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be reconsidered, and if approved by two thirds of that House, it shall become a Law. But in all such Cases the Votes of both Houses shall be determined by yeas and Nays, and the Names of the Persons voting for and against the Bill shall be entered on the Journal of each House respectively. If any Bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary (except on a question of Adjournment) shall be presented to the President of the United States; and before the Same shall take Effect, shall be approved by him, or being disapproved by him,

shall be repassed by two thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill.

Section. 8. The Congress shall have Power To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties, Imposts and Excises shall be uniform throughout the United States;

To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

To establish an uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

To establish Post Offices and Post Roads;

To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

To constitute Tribunals inferior to the supreme Court;

To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

To provide and maintain a Navy;

To make Rules for the Government and Regulation of the land and naval Forces;

To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

To provide for organizing, arming, and disciplining the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;

To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the Same shall be, for the Erection of Forts, Magazines, Arsenals, dock-Yards, and other needful Buildings:—And

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

Section. 9. The Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or duty may be imposed on such importation, not exceeding ten dollars for each Person.

The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.

No Bill of Attainder or ex post facto Law shall be passed.

No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken.

No Tax or Duty shall be laid on Articles exported from any State.

No Preference shall be given by any Regulation of Commerce or Revenue to the Ports of one State over those of another: nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time.

No Title of Nobility shall be granted by the United States: And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince, or foreign State.

Section. 10. No State shall enter into any Treaty, Alliance, or Confederation; grant Letters of Marque and Reprisal; coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing its inspection Laws: and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury of the United States: and all such Laws shall be subject to the Revision and controul of the Congress.

No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of delay.

Article. II.

Section. 1. The executive Power shall be vested in a President of the United States of America. He shall hold his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows

Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certify, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no Person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Vote shall be taken by States, the Representation from each State having one Vote; A quorum for this Purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the Same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be encreased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them.

Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation:—"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Section. 2. The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in the courts of Law, or in the Heads of Departments.

The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Section. 3. He shall from time to time give to the Congress Infor-

mation of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States.

Section. 4. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

ARTICLE. III.

Section. 1. The judicial Power of the United States shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behavior, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

Section. 2. The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens of another State;—between Citizens of different States,—between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.

In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

Section. 3. Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

The Congress shall have power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attainted.

ARTICLE. IV.

Section. 1. Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.

Section. 2. The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States.

A person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive Authority of the State from which he fled, be delivered up, to be removed to the State having Jurisdiction of the Crime.

No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

Section. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

Section. 4. The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

ARTICLE. V.

The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year One thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate.

ARTICLE. VI.

All Debts contracted and Engagements entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

ARTICLE. VII.

The Ratification of the Conventions of nine States shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

DONE in Convention by the Unanimous Consent of the States present[1] the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty-seven and of the Independence of the United States of America the twelfth IN WITNESS whereof We have hereunto subscribed our Names,

AMENDMENTS TO THE CONSTITUTION OF THE UNITED STATES

"Resolved, By the Senate and House of Representatives of the United States of America, in congress assembled, two-thirds of both Houses concurring, that the following articles be proposed to the Legislatures of the several States, as amendments to the Constitution of the United States; all or any of which articles, when ratified by three-fourths of the said Legislatures, to be valid to all intents and purposes, as part of the said Constitution, namely:"

THE TEN ORIGINAL AMENDMENTS
(Dec. 15, 1791)

Article I—Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

Article II—A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

Article III—No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war, but in a manner to be prescribed by law.

Article IV—The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

Article V—No person shall be held to answer for a capital or other infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

Article VI—In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which districts shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defence.

Article VII—In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

Article VIII—Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

Article IX—The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

Article X—The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

Article XI—(Jan. 8, 1798)—The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States, by citizens of another State, or by citizens or subjects of any foreign state.

Article XII—(Sept. 25, 1804)—The electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which list they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate; the President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

Article XIII—(Dec. 18, 1865)—1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

2. Congress shall have power to enforce this article by appropriate legislation.

Article XIV—(July 28, 1868)—1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male members of such State, being of twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

3. No person shall be a Senator or Representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid and comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection and rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

5. The Congress shall have power to enforce by appropriate legislation the provisions of this article.

Article XV—(March 30, 1870)—1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

2. The Congress shall have power to enforce the provisions of this article by appropriate legislation.

Article XVI—(Feb. 25, 1913)—The Congress shall have power to lay and collect taxes on incomes, from whatever sources derived, without apportionment among the several States, and without regard to any census or enumeration.

Article XVII—(May 31, 1913)—1. The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof, for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislatures.

2. When vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct.

3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

Article XVIII—(Jan. 29, 1919)—1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several

States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

Article XIX—(Aug. 18, 1920)—1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

2. The Congress shall have power by appropriate legislation to enforce the provision of this article.

Article XX—(Feb. 6, 1933)—1. The terms of the President and Vice-President shall end at noon on the 20th day of January, and the terms of Senators and Representatives at noon on the 3rd day of January, of the years in which such terms would have ended if this article had not been ratified; and the terms of their successors shall then begin.

2. The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the 3rd day of January, unless they shall by law appoint a different day.

3. If, at the time fixed for the beginning of the term of the President, the President elect shall have died, the Vice-President elect shall become President. If a President shall not have been chosen before the time fixed for the beginning of his term, or if the President elect shall have failed to qualify, then the Vice-President elect shall act as President until a President shall have qualified; and the Congress may by law provide for the case wherein neither a President elect nor a Vice-President elect shall have qualified, declaring who shall then act as President, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a President or Vice-President shall have qualified.

4. The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a President whenever the right of choice shall have devolved upon them, and for the case of the death of any of the persons from whom the Senate may choose a Vice-President whenever the right of choice shall have devolved upon them.

5. Sections 1 and 2 shall take effect on the 15th day of October following the ratification of this article.

6. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission.

Article XXI—(Dec. 5, 1933)—1. The Eighteenth Article of amendment to the Constitution of the United States is hereby repealed.

2. The transportation or importation into any State, Territory, or possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by conventions in the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

Article XXII—(Feb. 26, 1951)—1. No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once. But this Article shall not apply to any person holding the office of President when this Article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this Article becomes operative from holding the office of President or acting as President during the remainder of such term.

2. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission to the States by the Congress.

GOVERNMENT

An account of the governmental system of the United States must be largely descriptive of the organization of national and state governments. But it must also analyze certain of the fundamental characteristics that distinguish the United States government from other governments. Bearing this twofold object in mind, it will be convenient to discuss the general characteristics first, and to follow with a description of governmental organization. Under this plan, the discussion of the constitution and government of the United States is organized on the following plan: (1) Federal system; (2) written constitutions; (3) judicial construction of written constitutions; (4) separation of powers; (5) presidential system of executive organization; (6) national government; (7) state governments; (8) local government in the states; (9) elections and political parties.

1. FEDERAL SYSTEM

By the Declaration of Independence in 1776, the 13 American colonies of Great Britain expressed their action as that of "these united colonies," but the terms of the declaration implied that each became an independent state. The 13 united in declaring independence and in the conduct of war, though their co-operation was largely ineffective. The Articles of Confederation, adopted in 1781, constituted a legal symbol of union, but the central government under these articles had no coercive power over the states and no power whatever capable of exercise directly upon the citizens of the states. The national constitution, framed in 1787 and put into effect in 1789, was intended to remedy this situation by creating a central government with large powers and with authority to exercise these powers, not merely upon the states, but directly upon all citizens of the country. When the first congress of the United States under the constitution of 1787 assembled in New York in April 1789, the union had a membership of 11 states. North Carolina and Rhode Island soon joined their sisters of the original 13 states.

Share of States in the Government of the Nation.—Under the federal principle in the United States, the states, as such, are constitutionally guaranteed their territorial integrity and are expressly recognized as units in the organization of national government. They have equal representation in the United States senate. They are treated as units in the election of president and vice-president and of members of the federal house of representatives. They have a decisive share in the amendment of the constitution of the United States.

When the national government was being formed, a sharp conflict of interests arose between the small states and the large states. The smaller states contended for complete equality among the states in the organization of the national government, and the larger states contended for influence in proportion to population. A compromise was reached by which the states are equally represented in the United States senate, irrespective of population, and in proportion to their population in the house of representatives. By the terms of the constitution no state may without its consent be deprived of its "equal suffrage in the Senate."

Representation in the national house of representatives is based upon population. Under the constitution, each ten years, after the decennial federal census, the congress of the United States determines how many members will constitute the house of representatives. This number is then divided into the total population of the 48 states. In this manner a ratio of representation is obtained. Each state is entitled to as many representatives as this ratio is contained in its population, although each state, no matter how small its population, is entitled to at least one representative. After the division of the representative ratio into the population of each of the states, large fractions of population may remain; and the states having the largest remainders received additional representatives, as long as the number agreed upon was not exceeded. The problem of fractions presented difficulties. A method known as the method of major fractions was used in 1910; choice of several methods of computation was provided by an act of 1929; and by act of 1941 the method known as the method of equal proportions was adopted. No apportionment was made after the census of 1920, and provision was made in 1929 for automatic reapportionment of the existing number of representatives in case congress did not enact an apportioning act within 60 days after receiving the decennial statistical information on which apportionment is based. By act of 1941 automatic decennial reapportionment was provided without change in the existing number of representatives. The number of representatives and the method of apportionment are subject to change by congress.

In the election of the president and vice-president of the United States, the framers of the national constitution provided for so-called electoral colleges. Each state chooses a number of presidential electors equal to the number of its members in the national house of representatives, plus its two senators. The plan of the constitution was that these electors should actually exercise a choice as to who should be president. However, almost since the beginning of the government, candidates for the presidency and vice-presidency have been nominated by the great political parties of the country in advance of the choice of electors. These political parties also nominate within each state their candidates for presidential electors. The candidates of any party for electors are definitely pledged in advance to vote for the candidates nominated by that party for president and vice-president. For this

reason, everybody knows who will be president immediately after the November election, at which the electors themselves are chosen. In this respect, unwritten law, developed by usage, has altered the operation of the written text of the constitution. In recognition of the fact that presidential electors are merely a device for casting a certain number of votes allotted to the state, at least one-third of the states now provide for a direct vote for candidates for president and vice-president and omit from their ballots the names of candidates for presidential electors. Although each state has power to appoint its presidential electors in such a manner as the legislature thereof may direct, each state has, except in a few cases, chosen such electors by popular vote, its electoral vote then being cast for the presidential candidate with the larger popular vote in the state, even though such vote may not have been a majority.

A constitutional amendment submitted by Sen. Henry Cabot Lodge of Massachusetts would alter this plan. By it, for example, if a state having eight house members together with two senators (constituting ten electoral votes) had 400,000 votes for presidential candidates, 200,000 for one candidate, 160,000 for another and 40,000 for another, the whole electoral vote would not go for the first candidate. Instead, the first candidate would receive five electoral votes, the second four and the third one.

The great political parties nominate candidates in national nominating conventions, which usually meet in June or July preceding the November election for the choice of presidential electors. These conventions are composed of delegates chosen either by primary elections or by party conventions in the states. In the Democratic convention each state is represented by a number of delegates equal to twice the number of the state's combined representation in the senate and house of representatives of the United States. In the national Republican convention the representation of the states in the two houses of congress is also taken as a basis. But additional representation is given in each convention for favourable popular voting in the preceding presidential election. The states may, however, properly be regarded as units in the machinery for nominating party candidates. And in the nomination of presidential candidates, a populous state wields a large influence—an influence greatly magnified if the state is both populous and politically doubtful.

Two methods are provided for amending the constitution of the United States. An amendment may be proposed by two-thirds of the members of both houses of congress and goes into effect when ratified by the legislatures of three-fourths of the states, or by conventions in three-fourths of the states, as congress shall determine. Congress is required by the constitution to call a convention for proposing amendments, on the application of the legislatures of two-thirds of the several states. No such convention has ever been called, and until 1933 congress always provided for the ratification of federal amendments by state legislatures rather than by conventions called for this purpose. In 1933 congress chose the alternate method of ratification by state legislatures and submitted the question of repealing the 18th amendment to state conventions. Adopted later in the year, this proposal became the 21st amendment.

The states as governmental units still have a decisive influence with respect to any change in the national constitution. In other respects, so far as they influence the organization and government of the nation, they have tended to become merely units for national election purposes. The state has to a large extent lost its political individuality as a unit in the government of the nation. The decreased political importance of the state as a unit in national affairs was caused mainly by the development of rapid means of travel and of communication. The constant shifting of population from one state to another prevented the newer states from developing the solidarity possessed by the original 13. The very increase in the number of states also reduced the importance of each as a unit in the national government.

Not only this, but, since the establishment of the federal system, national politics has dominated. The ambitious political leader looks to advancement from state to national office. Nominations for the presidency are the most conspicuous prizes in the political organization. The popular election of United States senators by each state under the 17th amendment itself tended to reduce emphasis upon the state as a political unit and to treat it as merely an electoral area in the organization of the national government. While the states still determine affirmatively who shall vote in state and national elections, the 15th and 19th amendments forbid discrimination because of race, colour, previous condition of servitude or sex, and the United States supreme court held that the 14th amendment forbids state legislation with respect to like discriminations in party primaries. Of all the states, Maine alone still adheres to a date for state elections different from that for national elections. As soon as national and state elections came generally to be held upon the same day, there was a full establishment of the dominance of national politics.

Powers of the States and Nation.—In powers within their own borders and in senatorial representation the states are equal.

The states under the federal system are units in the formation of a nation, not governments independent of a nation. Before the Civil War a number of conflicts arose between national and state power, in which first one group of states and then another asserted its authority to proceed independently of the nation. Pennsylvania, Massachusetts, Virginia, South Carolina and other states in turn opposed the supremacy of national power under the constitution. The Civil War settled finally and conclusively that the states are merely units, although indispensable units, in the formation of a single national organization.

The limitations imposed upon the states by the constitution of the United States clearly indicate the purpose to establish a single national organization with the states as units in that organization. States are forbidden, without the consent of congress, "to keep troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent Danger as will not admit of delay." They are forbidden to enter into treaties, alliances or confederations. These types of limitations upon the states indicate a definite purpose to deprive the states of any independent existence as organizations in themselves, and this purpose is supported by the language making the "Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States" the supreme law of the land.

The power of congress to consent to an agreement or compact by one state with another state is important, particularly where states are close to each other. Such consent has authorized cooperation between states in the construction and use of bridges and tunnels, the apportionment of waters, harbour development, improvement of navigation, flood control, sanitation or abatement of pollution, conservation of fisheries, recreation, crime prevention and the regulation of oil production. Political compacts, however, have not been undertaken between states.

The powers of the national government are such as are granted to it by the constitution of the United States. They must be found within the terms of that document. It has no others. This basic principle was implied but not expressed in the constitution as first adopted. So important was its expression in the constitutional text regarded that the 10th amendment, adopted in 1791, provides that "powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people." Yet, as late as 1941, the United States supreme court said that this amendment was but a truism. The states gave up certain powers in establishing the national government. They set out these powers in a written document and expressly reserved all other powers to themselves or to the people. The powers of the nation, found within the terms of this written document, are superior to the powers of the states.

Who is to determine, in case of doubt or conflict, whether such a superior power, asserted by the government of the United States, is within the terms of the constitution? Before the Civil War, states often asserted the authority to determine for themselves what powers belonged to the national government, but such assertions were unsuccessful. Since 1816 the legal principle has

been established that the line between national and state powers is to be drawn by the United States supreme court, an organ of the national government.

What are the powers granted to the nation? Express powers, couched in most cases in broad language, are conferred on congress, by a series of 18 paragraphs in article I, section 8, of the constitution. In even more general terms powers are conferred on the executive and judicial departments of the United States. In only one case is the power granted to the national government expressed as an exclusive power. Certain powers are of such a character that they must be exercised exclusively by the national government, as, for example, the levying of federal taxes, borrowing money on the credit of the United States, constituting federal tribunals inferior to the supreme court and the establishment of a uniform rule of naturalization. Others are made exclusively national by constitutional prohibitions upon the states. The federal power to coin money is supplemented by forbidding states to coin money. The federal war powers are made exclusive by prohibitions upon the states. The federal treaty-making power is supplemented by forbidding state treaties and by inhibiting state compacts without the consent of congress. Other powers are of such a character that they may be exercised by either of two governments, but not by both. The grant of such a power to the national government makes it exclusive.

Of necessity, many of the powers granted to congress are not exclusive. In such matters, states may exercise power also, provided state action does not conflict with the superior powers of the national government in the same field. Congress has complete power to regulate bankruptcies, but during a good part of the time since 1789 there has not been a federal bankruptcy law, and the matter has been left to the states. Congress has only in small part exercised its power to fix the standard of weights and measures, and there is valid state legislation upon this subject in all the states.

The constitution itself expressly provides for concurrent authority over the militia.

Under a general grant of power to regulate interstate commerce, congress has full power, but the states may legislate in regard to local needs and circumstances, unless congress otherwise directs.

Although all powers of the national government must be found within the terms of a written document, this by no means implies that all powers must be expressly granted by that document. The constitution of the United States grants a number of important powers in broad terms to congress and to the other departments of the national government. It further empowers congress "to make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof."

Throughout the earlier decades of government under this constitution, political and legal contests centred about the meaning of the words "necessary and proper," one party emphasizing the word "necessary" as narrowing the powers conferred and the other the word "proper" as broadening them. The rule of broad and liberal construction announced by Chief Justice John Marshall in 1819 has prevailed:

"Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, and which are not prohibited, but consistent with the letter and spirit of the Constitution, are constitutional."

Substantially all powers not national belong to the states, and such powers must be determined in large part by a process of subtraction. Naturally no precise result can be obtained when the powers to be subtracted are based on broad implications and are not definitely determined. The important national powers with respect to interstate commerce, taxation, treaties, post offices and post roads and maritime jurisdiction have been construed broadly, almost without exception.

The United States supreme court has long been engaged in determining the line between national and state power. This is a continuing duty. It is impossible to draw any definite or permanent line between national and state functions. The steamboat and the railroad, the telephone and the telegraph, the aeroplane, the radio and television were potent factors in the development of national power. Railroad regulation began with the states but has tended to come almost completely under national control. Rapid progress in this direction has been made since the creation of the Interstate Commerce commission in 1887. The so-called antitrust movement began with the states, but restrictive commercial practices have largely come under national supervision with the Sherman Anti-Trust act of 1890 and the creation of the Federal Trade commission in 1914. Where a problem is national in character, its solution will by some means fall to the national government. The broad and flexible powers of that government are capable of further expansion as new needs develop with economic, social and engineering changes.

Along with the increase in national powers and in the activities of the national government has come also a similar increase in the functions performed by the state government. State governments today do more than ever before and cost more in proportion.

Powers of state governments are broad and comprehensive. Subject only to the condition that the government shall be republican in form, the states organize their own central and local governments and provide revenues for the support of these governments. The state courts administer the great body of law affecting the rights of individuals and for the suppression of crime. Education, though aided by the national government, is under the control of the states and of the local governments created by them. The same statement applies to the construction and maintenance of highways and to the great mass of governmental details with which the citizen comes in daily contact. Indeed, except for the fact that the national government reoccupied the field of bankruptcy in 1898, the American is still in much the position described by James Bryce in the 19th century:

"The State, or local authority constituted by State statutes, registers his birth, appoints his guardian, pays for his schooling, gives him a share in the estate of his father deceased, licenses him when he enters a trade (if it be one needing a license), marries him, divorces him, entertains civil actions against him, declares him a bankrupt, hangs him for murder. The police that guard his house, the local boards which look after the poor, control highways, impose water rates, manage schools—all these derive their legal powers from his State alone."

But attention should be called to the fact that developments after 1933 greatly increased the importance of the national government, not only in the functions which it performs but also in its dominance over state governments. Unemployment compensation and old-age pensions are theoretically under state control, but in fact, federal control over state action is maintained through conditional federal subsidies and through a federal tax subject to 90% credit upon state compliance with federal requirements. Through a broad construction of federal power to regulate "commerce . . . among the several States" there came a federal control over labour disputes and over hours and wages of labour where a substantial part of the articles dealt with has passed from one state to another or is to be marketed across state lines, or where the transaction is associated with the means of interstate traffic. Through the same power the national government came to determine the planting acreage of crops and the conditions and prices in the marketing of milk. Through the enormous funds spent on relief the national government also established a substantially complete dominance over the states. The states remain, and will remain, as instruments of government; but the dominating control of the national government will also remain. The functions enumerated by James Bryce will remain state functions, but the states will be largely dominated in the performance of these functions. The maintenance of state functions must, however, depend (1) upon the more efficient conduct of state governments and (2) upon the more effective co-operation with each other by the states as to problems which extend beyond the boundaries of a single state. Insurance was in 1944 held subject to control by congress as interstate commerce; but congress left control to the states, and the continuance of such state control is likely to

depend upon the efficiency and uniformity of state regulation.

Crime also came to be regarded as interstate, and thus more largely under federal control.

Separate Administrative and Judicial Systems of Nation and States.—Throughout the territory of each state two governments operate—the nation with its administrative and judicial organizations for the enforcement of national law, and the state with its administrative and judicial organizations for the enforcement of state law. Federal revenues are collected through officers controlled from Washington; state revenues are collected by independent state and local officers. Taxes levied by the two are in some cases similar in character. The nation and a number of states impose income taxes, but their administration is independent. Violations of state law are tried and punished in state courts; violations of national law, in separate federal courts. However, a decision by the United States supreme court in 1945 makes violation of state law by a state officer punishable in federal courts where the disobedience of state law by the state officer is violative of due process of law under the 14th amendment. In some cases the laws of the two are directed to the same purpose, and are substantially identical. The constitutions of both forbid that a person be twice put in jeopardy for the same offense, but in legal theory the two governments are so distinct that one act, forbidden by substantially identical laws of each, may be punished by each as a separate offense.

The reasons for this sharp distinction between the two governments are historical. The Articles of Confederation (1781–89) sought to act through the governments of the several states and not directly upon the citizens of the states. Government under these articles failed because each state finally determined for itself whether it would enforce the policies of congress. The national government, organized under the constitution of 1787, had it thought proper, might have sought to use the states as agencies for the enforcement of national law, as is largely done under the federal system of Switzerland. But under the circumstances it was natural to build up an independent administrative and judicial system. This system has steadily grown with the expansion of national activities.

Taxation of Employees and Securities of One Government by the Other.—For many years it was the established principle in the United States that the exercise of independent powers by the nation and the state forbade either government to tax the employees or securities of the other. This principle, which was based on the theory that "the power to tax is the power to destroy," was later in large part replaced by the principle that each government may without discrimination tax the income of employees of the other; and the same principle may be applied to the taxation of securities issued by the national, state and local governments. However, the U.S. supreme court expressed the view that the national government may enter upon an enterprise personal in nature and forbid state taxation thereon, but that a similar state enterprise may be taxed by the national government.

2. WRITTEN CONSTITUTIONS

Under the federal system it is substantially necessary to have a written document defining the organization of the central government and determining the respective powers of the states and the central government. It was natural that articles of confederation should be framed for the creation of the first union of the American states, and that, when improvement was needed, these articles should be replaced by the national constitution of 1787.

There was no similar legal necessity that written constitutions be framed for the government of the American states. Yet the Colonies were accustomed to written instruments of government. Certain of them operated under royal charters. Massachusetts largely remained under its charter government until 1780, Connecticut until 1818 and Rhode Island until 1842. In other colonies the royal commissions to governors gave some written basis for government. Moreover, the leaders in the Colonies were familiar with and largely adherents of the theory that government is a result of social compact, and theories of natural rights were strong.

It was therefore natural that, upon separation from England the several Colonies should embody in written form a declaration of their rights and the general organization of their governments. Before the framing of the national constitution in 1787, constitutions had been framed and adopted by all the original 13 states except Connecticut and Rhode Island. The framers of the national constitution therefore had before them the texts of state constitutions and were familiar with the experience under these constitutions. Each state is now governed by a written constitution.

3. JUDICIAL CONSTRUCTION OF WRITTEN CONSTITUTIONS

The constitution was regarded from an early date as law of a superior order and of a more permanent character than legislative acts. Under the first state constitutions legislatures were the dominant organs of government. They abused their wide powers and helped develop a feeling that legislative authority should in some measure be curbed. In New Jersey in 1780 a statute was declared invalid as violative of the state constitution. Other decisions of this character gradually accumulated. Apparently the framers of the federal constitution were in 1787 of the opinion that it would be the function of the federal courts to preserve the powers of state and nation under the federal constitution. Such a power in the federal courts carries with it authority, in a case involving the issue, to declare either a federal or a state law invalid as violative of the constitution of the United States. Since Chief Justice Marshall's opinion in 1803, in *Marbury* v. *Madison*, the principle of judicial power to declare laws unconstitutional has been established in the federal system. The authority of state courts to declare state laws invalid as violative of state constitutions is equally well established. Except for a few provisions which are regarded as committed to the political organs of government, it may therefore be said that placing language in a written constitution makes such language judicially enforceable as against the legislative bodies. Whereas parliament is the supreme lawmaker under the English system of government, in the United States the written constitution as finally construed by the courts is supreme. Where constitutional provisions are clear and precise, this supremacy of the constitution as judicially construed makes little difficulty. But where language is used that is not capable of precise definition, as that of the 14th amendment that no state shall "deprive any person of life, liberty, or property without due process of law," the court may in fact determine not only the constitutionality but also the wisdom of legislative action.

The exercise of broad judicial power in such a manner as to control legislative policy has, however, largely ceased; the "due process of law" clause, the principle of the separation of powers and the broad language of the constitution with respect to federal powers are now construed not only in such a manner as to enlarge national authority but also in such a manner as to leave larger powers in the hands of the political departments of government—the president and the congress in the national system.

4. SEPARATION OF POWERS

National and state governments in the United States are each organized into three departments. The theory of separation of powers is formally announced in 40 state constitutions. In the remaining eight state constitutions and in the constitution of the United States the same constitutional result arises from the fact that these nine documents create three departments of government and vest the legislative power in one, the executive power in another and the judicial power in a third.

There are no clear lines separating one governmental function from another, and the courts have therefore been unable to develop any logical lines of division. Legislative power having been delegated to congress and the state legislatures, the courts frequently say that legislative power may not be delegated, but the very necessities of modern life have forced in the United States, as in England and on the continent, the vesting of a large amount of subordinate legislative authority in permanent administrative bodies within the executive department. In order to avoid terming this a delegation, the courts have come to designate such powers as "quasi-legislative," rather than "legislative." In the same manner, administrative bodies within the executive department have come

to exercise powers that are sustained on the ground that they are "quasi-judicial" rather than "judicial." The result is therefore not dissimilar from that in countries that have not attempted to set up three separate departments through judicially enforceable constitutions. But such flexibility as develops under the U.S. plan comes more slowly and can be achieved only with judicial approval. A study of U.S. political institutions must, therefore, always take into account the greater rigidity in governmental structure resulting from the constitutional principle of separation of powers, although that rigidity has been to a large extent abandoned through less strict judicial construction.

5. PRESIDENTIAL SYSTEM OF EXECUTIVE ORGANIZATION

The federal government and the states of the United States have adopted the presidential system of executive organization, as distinguished from the cabinet or ministerial system found in England and most other countries. Under the presidential system there is an independent executive (president or governor) elected for a fixed term and holding office during that term irrespective of whether he is or is not in political harmony with both legislative bodies or either of them. The members of the legislative bodies are elected at fixed times and for fixed terms, and no power is vested in the executive to dissolve them or to force elections at any other times than those fixed. The principle of separation of powers as applied in the United States precludes any member of the executive department from having a seat in a legislative body. Under this system the president or governor has real executive authority, and in all states but North Carolina has and exercises large power to control legislation by an executive veto. The presidential system presupposes that the executive and the legislature may at times not be in political harmony. And in fact this is the case in many of the states and in the national system. In the states of New York and New Jersey, for example, the governors have often been members of the Democratic party, while both houses of the state legislature have been controlled by the Republican party. The power ordinarily vested in the legislative bodies to impeach and remove the executive is judicial in character, and efforts have only occasionally been made to employ the power of impeachment to remove an executive politically hostile to the two houses of the legislature. Such an effort was made, unsuccessfully, to remove Andrew Johnson from the presidency of the United States.

The presidential system is more rigid than the ministerial plan of government, but it accords with the U.S. doctrine of separation of powers. When the country faces a crisis, as during the Civil War and the World Wars, popular sentiment maintains political harmony between the president and congress; and the executive tends to become the dominant factor in government. The presidential system of the United States in fact met the serious problems of World Wars I and II with less difficulty than did the ministerial systems of England and France.

6. NATIONAL GOVERNMENT

National Constitution.—The constitution of the United States, framed in 1787 and adopted in 1789, is a brief and well-drafted document. Its influence has been felt, not only in the United States, but in the federal systems of Switzerland, Argentina, Brazil, Canada and Australia. The constitution outlines the organization of the three departments of the national government, defines the powers of that government and the relationship between the nation and the states. It provides a method of amendment and up to mid-20th century had been amended 22 times since its adoption. The first ten amendments, adopted in 1791, were the direct results of criticisms of the constitution at the time of its adoption and may almost be regarded as parts of the original document. Of the other amendments, the 11th, adopted in 1798, overcame a decision of the United States supreme court to the effect that a state might be sued by a citizen of another state. The 12th amendment, adopted in 1804, corrected a defect in the original constitution as to the method of choosing the president and vice-president. The 13th, 14th and 15th amendments were the immediate outcome of the Civil War. The 13th abolished slavery, the 15th forbade denial of the right to vote "on account of race, color, or previous condition of servitude." The 14th amendment, regarded for a while by the courts as limiting itself to the protection of the freed slaves, has become, by expansion of the terms "due process of law" and "equal protection of the laws," the means through which the United States supreme court determines the policy of state enactments in the field of social legislation. The 16th amendment in 1913 gave congress an effective power to levy a federal income tax. Popular election of United States senators under the 17th amendment, adopted in 1913, has somewhat reduced the importance of the state, as did the 18th (1919) transferring the liquor problem to the national government. The 19th amendment (1920) nationalized women's suffrage. The 20th amendment altered the time of beginning of terms of president, vice-president, senators and representatives; changed the time for sessions of congress; and provided for certain contingencies which may arise as the result of the death or failure to qualify of a president-elect. The 21st amendment repealed the 18th amendment and restored the control of intoxicating liquors to the states. The 22nd limited the presidential tenure of office to two elective terms. On the whole, the process of amendment, while to some extent enlarging federal powers, has been less influential in this direction than the decisions of the U.S. supreme court.

Congress.—Legislative power in the national system is exercised by a congress composed of two houses. The two houses have grown—the senate from 26 to 96 members, and the house of representatives from 65 to 435 members.

With respect to the house of representatives, article I, section 2 of the constitution provides that: "when vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies." With respect to the senate, the 17th amendment provides that: "when vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct." Temporary appointments to the senate are infrequent.

United States senators are elected for six-year terms, and terms are so arranged that one-third of its members retire each two years. Since 1913 the elections in each state are by popular vote of the whole state, except that temporary appointments to fill vacancies are permitted. Members of the house of representatives are elected for two years, and the whole membership changes each two years. Each state is required to be divided into districts equal to the number of members it has in the house of representatives; but if the number of representatives apportioned to a state is increased, and the state legislature makes no reapportionment of districts within the state, then the additional representative or representatives are elected by the state at large; if the number of representatives apportioned to a state is decreased, and the state legislature makes no reapportionment of districts within the state, then all representatives are elected by the state at large. Each member of the house of representatives is required to be a resident of the state from which he is chosen; political and sectional interests make it practically impossible for a person to be elected for a district within the state in which he does not reside. The result is that an able and experienced person ceases to be a member of congress if he fails of re-election by his district. In addition to the elected members, territorial delegates sit without vote in the house of representatives—one each from Alaska and Hawaii. One resident commissioner from Puerto Rico also has a seat in the house.

Beginning in Jan. 1947, the compensation of senators, representatives in congress, delegates from the territories and the resident commissioner from Puerto Rico is at the rate of $12,500 per annum each; from 1949 the compensation of the speaker of the house of representatives and the vice-president of the United States is at the rate of $30,000 per annum each. Whenever there is no vice-president, the president of the senate for the time being is entitled to the compensation provided by law for the vice-

president. Starting also in Jan. 1947, each member of either house receives an additional $2,500 per annum as an expense allowance for which no accounting is made. Beginning at the same time the government contributes to an annuity which a retiring member of congress may receive after six years of service and attainment of the age of 62 years, or upon retirement for disability after five years of service.

Prior to the adoption of the 20th amendment, on Feb. 6, 1933, the president, vice-president, senators and members of the house of representatives assumed office on March 4 following their election; and the congress met annually on the first Monday of December. Under this plan newly elected members of the senate and house, elected in November of an even-numbered year, did not take office until March 4 of the succeeding year; and, unless the president called a special session of congress, the newly elected members did not actually begin to function until the regular session in the succeeding December, more than a year after their election. It was possible that the session meeting from Dec. 3 of the even-numbered year until March 4 of the odd-numbered year be controlled by members who had already failed of re-election, and who might therefore be regarded as no longer representing their constituents. In order to avoid control of a session of congress by defeated members, who were termed "lame ducks," the 20th amendment was adopted, under which the terms of the president and vice-president begin on Jan. 20 following their election; the terms of senators and representatives begin on Jan. 3 following their election and congress assembles each year on Jan. 3. The regular sessions of congress usually adjourn in the early summer. The president may on extraordinary occasions convene the two houses in special session.

The organization and procedure of the two houses of congress are to a limited extent determined by congress and to a larger extent by the size and traditions of the two houses. The rules of the senate permit great freedom of debate; those of the house of representatives restrict debate and expedite business. Under the senate rules obstructive tactics may be and are often resorted to, though such tactics relate in fact to relatively few measures. The house of representatives, with its larger membership, would be helpless with complete freedom of debate, yet both houses accomplish a large amount of legislative business.

The house of representatives elects from its own members a speaker as presiding officer. The vice-president of the United States is the presiding officer of the senate. The work of both houses is largely done in committee. The committee systems of both houses developed largely by accident; and many committees in each house, once created for important tasks, remained long after their usefulness had ceased. The senate, in 1921, and the house of representatives, in 1927, reorganized their committees and materially reduced their number. But further increases immediately began, and multiplicity of committees, with conflicts of their jurisdiction in each house, led to confusion and interfered with joint action by committees of the two houses. With legislation enacted in 1946, 15 standing committees replaced 32 in the senate and 19 replaced 48 in the house. The act also specifically defined the authority of each committee, and encouraged co-operation between the two houses.

Committees in each house are controlled by the political party having a majority of the members of that house. Appointment to important committees is based largely on seniority in term of service, and a member serving continuously over a long period is likely to become chairman of an important committee, if his political party is in control. Seniority as such naturally plays a larger part in the house of representatives than in the senate with its smaller number of members, though the business of the senate is in good part controlled by a small group of experienced members. Leadership in the two houses is always exercised by a few members of the politically dominant party. In the house of representatives for many years before 1911, the real leadership was largely vested in the speaker, who made the appointments to standing committees. After 1911 the speaker was relegated more distinctly to the position of presiding officer, and committees were elected by the house itself on the basis of selections first made by the party organizations. The majority and minority floor leaders have large influence. In the senate there is less individual leadership than in the house of representatives.

Federal Executive.—In discussing the presidential system, the relation between the president and congress has been generally described. There were no constitutional limitations upon a president's succeeding himself, but a tradition long existed that a president should not serve for more than two terms, a tradition based on the example set by George Washington and other early presidents. This tradition was broken by Franklin Delano Roosevelt, who was elected successively in 1932, 1936, 1940 and 1944, and who served from 1933 until his death on April 12, 1945. The 22nd constitutional amendment, proposed in 1947 and ratified by three-fourths of the states in 1951, provides that: "No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once." This amendment was made specifically inapplicable to the person holding the office of president during the time of proposal and adoption of this amendment.

The constitution expressly authorizes the president to make certain appointments to office and the expansion of the national administration has greatly increased the number of officers owing their appointments to him. The more important appointments are subject to confirmation by the senate. The United States supreme court has determined that where power to appoint to an executive office is vested in the president, this carries with it a complete power to remove from office. Efforts upon the part of congress to impose restrictions upon the president's power to remove even his more direct advisers in 1868 led to the impeachment of Pres. Andrew Johnson, who escaped conviction by one vote. However, the president's power of removal may be limited by act of congress with respect to quasi-legislative or quasi-judicial officers, who are required to discharge their duties independently of executive control; and the use of such officers (particularly as members of independent commissions) has greatly increased with the extension of federal control with respect to commercial transactions of various types, including labour disputes and hours and wages of labour.

The president's control over the national executive administration is primarily exercised through the heads of ten executive departments, appointed by the president. These departments are: department of state; department of the treasury; department of defense; department of justice; post office department; department of the interior; department of agriculture; department of commerce; department of labour; department of health, education and welfare. Department heads (the cabinet) are responsible to the president, and the extent to which he meets with them and seeks their advice rests entirely on his discretion. In addition to these ten departments there are numerous boards and offices. The federal executive organization under the president is not systematically organized, and plans for its reorganization came under consideration early in the 20th century. During World War I and World War II the creation of new governmental agencies was necessary, and wide powers were conferred upon the president to redistribute the functions of governmental agencies. The need for reorganization in time of peace had become increasingly apparent with the expansion of activities of the national government. Definite steps toward such reorganization were taken by an act of congress in 1933 which vested some power in the president for a two-year period and by an act approved April 3, 1939, which vested authority in the president to submit reorganization plans to congress before Jan. 21, 1941, the organization submitted by the president to take effect within 60 days after submission unless the two houses should disapprove by concurrent resolution. Substantial improvements were obtained under this act. Some readjustments were obtained under a similar act of 1945, which, however, did not give sufficient power to the president. A reorganization act of 1949 was based upon investigation by a commission headed by former Pres. Herbert Hoover. Under this act the presi-

dent might submit reorganization plans to take effect upon the expiration of the first period of 60 calendar days of continuous session of congress, unless rejected by one of the two houses of congress. Twenty-seven such plans were submitted to congress by May 31, 1950.

The great mass of the lesser employees are selected under a merit system, for whose conduct a civil service commission was first created in 1883. (*See* CIVIL SERVICE: *United States.*) The finances of the national government were to a large extent systematized through the creation of a bureau of the budget in 1921 and through an improved committee organization effected in the house of representatives in 1927 for the consideration of national appropriations and expenditures.

The president's influence in the national government rests upon (1) powers granted him by the constitution and by federal statute; (2) political factors not found in constitutions or statutes; (3) the personality of the president.

The president's position as head of a large executive organization, with wide powers of appointment and removal, in itself makes the position important. The authority to veto legislation, subject to being overridden by two-thirds of the two houses, gives him a power that may be employed with effect. The authority to recommend measures to congress is only of such value as may be given to it by the position and influence of the president making the recommendation. He is charged with the conduct of foreign relations, though here his authority is materially crippled by the requirement that two-thirds of the senators concur in treaties.

But the president's political position is equally as important as his constitutional power. He is in effect the chieftain of his party. He is also the outstanding figure in U.S. politics.

The possibilities of exercising power are great. The extent to which power is actually exercised depends upon the personality of the president and his capacity for political leadership. The influence of the presidency varies with the man who occupies the office and with the circumstances that surround him, as in time of war.

Little need be said about the vice-president. His chief official duty is to preside over the senate, though he has substantially no influence in the deliberations of that body. The machinery for nominating party candidates ordinarily chooses a vice-presidential candidate almost purely on the basis of political expediency and with little consideration of the fact that the vice-president may succeed to the presidency.

Yet within the first half of the 20th century three vice-presidents—Theodore Roosevelt, Calvin Coolidge and Harry S. Truman—succeeded to the presidency as a result of death, and thereafter were elected to the office. In the case of death or disqualification of both president and vice-president, it was provided by the Presidential Succession act of 1947 that succession to the presidency be first to the speaker of the house of representatives; next to the president pro tempore of the senate; and successively to members of the cabinet who are heads of the departments listed several paragraphs above.

The president receives for his services the sum of $100,000 per year. The salary of the vice-president is $30,000 per year.

Federal Judiciary.—The constitution of the United States provides for a supreme court and "such inferior courts as the Congress may from time to time ordain and establish." For the enforcement of federal law, congress has provided a complete judicial system paralleling that of the states. The judges of these courts are appointed by the president of the United States and hold their offices during good behaviour. They are removable only by the cumbersome machinery of impeachment.

At the head of the judicial system is the supreme court of nine judges, which sits at Washington. There are 11 judicial circuits of the United States, each with at least 3 judges, one being the District of Columbia with 9 judges, the 11 together having 68 circuit judges. To each circuit is assigned a justice of the United States supreme court, one of the justices being assigned to two circuits and the chief justice being assigned to both the District of Columbia and an additional circuit. The pressure of business in the United States supreme court, however, made it impossible for the judges of the supreme court to go on circuit. The district court is the court of original jurisdiction. In erecting districts for the organization of this court, state lines are regarded. The smaller states constitute single districts; the larger are divided. For the districts in which federal judicial business is especially heavy, more than one district judge is provided. For example, four districts with 26 judges exist in New York. There are 93 districts with more than 200 judges, and the number of judges constantly increases. In addition to the general system of courts here outlined, there are a court of claims, court of customs and patent appeals, the tax court of the United States and federal courts for the District of Columbia and the territories.

With the two systems of courts—federal and state—exercising jurisdiction over the same territory, it is necessary that there be certain principles as to their relationship. Such principles may be chiefly summarized as follows:

1. Upon questions of federal constitutional law, the United States supreme court is the final court of review. If the highest court of a state holds a federal statute or treaty to be invalid, or a state statute valid that is alleged to violate the federal constitution or federal statutes, the losing party has a right to a final decision by the highest federal court. Where federal constitutional issues are otherwise involved in state courts, the United States supreme court may, in its discretion, review the state decision.

2. Substantially all cases involving enforcement of criminal law of the federal government are tried in federal courts.

3. With few exceptions, cases of admiralty and maritime jurisdiction and bankruptcy proceedings are tried in the federal courts.

4. Under federal statutes, the federal courts alone have jurisdiction of suits against the United States, and of suits for the enforcement of federal revenue, immigration and other similar laws directly affecting the administration of the federal government.

5. In civil cases involving as much as $3,000, and (*a*) arising between citizens of different states or (*b*) arising under the constitution, laws or treaties of the United States, the parties have the choice of suing either in state or federal courts; but if the plaintiff sues in the state court, the defendant may transfer the case to the federal court.

6. By statute it is provided "that the laws of the several States, except where the constitution, treaties or statutes of the United States otherwise require or provide, shall be regarded as rules of decision in trials at common law, in the courts of the United States, in cases where they apply." By recent decisions of the United States supreme court, the federal courts must apply not only state statutes but also the law as found in the decisions of the state courts. Until the adoption of uniform rules of civil procedure for United States district courts in 1937, the procedure in such courts in cases at common law was required to conform, as near as may be, with the procedure "in like causes in the courts of record of the State within which such district courts are held."

Through legislation of 1925 an effort has been made to reduce the number of cases that must be decided by the United States supreme court. That court has a limited original jurisdiction, the most important cases of such jurisdiction being cases to which a state is a party. Cases not infrequently arise in which one state sues another state. Aside from its original jurisdiction, cases come to the United States supreme court either from the highest state courts or from the lower federal courts. The decisions of the United States supreme court are of primary importance in the fields of constitutional and public law.

7. STATE GOVERNMENTS

The 48 state governments of the United States have certain common characteristics. Each state is legally the equal of every other state in the federal system. Each controls the organization of its own state and local governments. Each has a written constitution providing for three departments of government, with a legislature of two houses (with one exception) elected by popular

vote and a popularly elected governor as head of its executive department. Each state has a judicial system not essentially dissimilar in external organization from that of the other states. Each state has created local governing areas for the performance of certain functions. The government of each state and of its important local areas is controlled through political parties organized on a national basis.

Superficially, all the 48 state governments appear to be more or less alike and appear to be doing the same things. The constant shifting of population has prevented the development of sharp differences in governmental organization. Not only this, but from one state to another there has been a great deal of copying of political and legal institutions. However, each state is distinguished from its fellow states, not only in size and population, but also in location, climatic conditions and resources; and these differences reflect themselves in the political and governmental organization of the states.

State Constitutions.—The constitutions in force in the 48 states vary a great deal in length and in content. Some were adopted in an earlier period, and some bear recent dates. The constitution of Connecticut, adopted in 1818, together with subsequent amendments, requires only about 16 printed pages; the Louisiana constitution of 1921 requires 90 pages. The constitutions of Oklahoma, California and a number of other states are highly detailed. Massachusetts still boasts that it is governed by the constitution of 1780; but this constitution has been altered in form by so many amendments that it would hardly be recognized by its original framers. By amendment or by the adoption of new constitutions, the states have steadily readjusted their institutions to meet changing needs. The national constitution has proved a model for much of the development in the field of state constitutional history, particularly with reference to the establishment of three co-ordinate departments of government.

In most of the states the state constitutions organize three departments of government in some detail. They contain elaborate declarations or bills of rights, and most of them contain provisions regarding the organization of local government. Limitations upon the power of state legislatures have multiplied. Moreover, the framers of constitutions are inclined to include in these documents regulations of any matters of great public interest at the time. The state constitution has in this way come to contain many matters of temporary detail, and such detail requires frequent amendment.

The state constitutions provide for methods of change. The methods employed are three: (1) constitutional conventions; (2) legislative proposal of amendments; (3) proposal by popular initiative petition. All but 12 of the state constitutions expressly provide for constitutional conventions; in all of these 12 it is recognized as proper to employ conventions for constitutional change. Ordinarily conventions assemble as a result of popular vote and submit their recommendations for popular approval.

Proposals of constitutional amendment may be made by the legislatures in 47 states. In New Hampshire changes may be made only by constitutional convention. Methods of amendment through legislative proposal vary in the 47 states, but in all except Delaware, a legislative proposal of amendment must be submitted to and approved by popular vote before it becomes effective. Details of the amending process vary. In some states, as California, Louisiana, New York, the adoption of amendments through legislative proposal is easy; in others, as Illinois and Minnesota, the constitution is substantially impossible to amend, although an effort at greater ease was made by Illinois.

The proposal of constitutional amendments through popular initiative petition, followed by popular vote, is a fairly recent development; but this plan has now been adopted by 13 states. In these states also, there is a varying ease or difficulty in employing the plan of amendment. In Oregon and four other states it is as easy to amend the constitution through initiative petition and popular vote as it is to enact a statute through the same devices. In each state that had adopted the plan of popular initiative, this plan has merely been added to the two already existing devices of constitutional conventions and proposal by legislative action. By the three methods of change more than 1,500 amendments were proposed in the 48 states between 1900–20, of which about three out of five were adopted.

State Legislature.—In all of the states except Nebraska, legislative power is exercised by a body composed of two houses. Constitutional amendments for the organization of a legislative body composed of but one house were proposed in Oregon in 1912 and 1914, in Oklahoma in 1914 and in Arizona in 1916. All of these proposed amendments failed, but the plan of a unicameral legislature was adopted by Nebraska in 1934. Since Vermont abandoned the unicameral system in 1836, the Nebraska legislature of 1937 was the first to be so organized. It is composed of a single chamber of 43 members elected on a nonpartisan basis. In all other states, the smaller of the two houses is called the senate. All but eight of the states call their larger house a house of representatives; but the eight have such varying titles as assembly, general assembly and house of delegates. Nearly half of the states use the term legislature to designate the two houses together; but 20 use the term general assembly and 3 use the term legislative assembly. Massachusetts still uses the term general court, which was first employed in the colonial charter, and New Hampshire uses the same term. In view of the fact that the legislative bodies have somewhat varying names in the several states, it has been customary to refer to the larger of the two houses as the lower house and to the smaller as the upper house.

To a large extent the exact number of members of the two houses, or of one of the two houses, is left to legislative determination, subject to constitutional restrictions. The size of the two houses varies a good deal from one state to another. The Minnesota senate is the largest, with 67 members, and that of Delaware the smallest, with 17. The size of the lower house ranges from 35 in Delaware to 443 in New Hampshire. The membership of the lower houses is especially large in several of the New England states because of the system of town representation, but in these states the senate is relatively small.

In a majority of states, senators are elected for four years and representatives for two years. In some states, one-half of the members of the senate are elected every two years, so that the senate has continuous membership, as contrasted with the house, whose membership is chosen as a whole at each election. In Alabama, Louisiana, Maryland and Mississippi, however, four-year terms have been provided for members of both houses; and a number of states have a two-year term for members of both houses.

In some states financial measures must originate in the lower house; and in most of the states the senate has certain powers with respect to confirmation of executive appointments. The provisions for impeachment of public officers also ordinarily prescribe that charges shall be brought by the lower house and tried by the senate. But on the whole it may be said that, from the standpoint of legislation, the two houses of state legislature have equal powers and do not represent different points of view in the community. Distinct differences that existed in many states in earlier times have substantially ceased to exist, although in a number of states differences in territorial representation have grown up.

In the earlier state governments the substantially equal representation of local areas was not grossly unfair, because of the absence of great inequalities in their population. To a large extent, the idea of geographical representation survives in a number of states. The lower houses of Connecticut, New Hampshire and Vermont, and both houses of Rhode Island, are based upon town representation, and with the growth of large urban communities this basis has become highly unequal. In 1920 New Haven, with 162,000 inhabitants, had two representatives in the lower house of the Connecticut legislature, but so also did the town of Union, with 257 inhabitants. Such inequality is not confined to New England.

The present representative system is the result of two conflicting forces. In most of the states some attention is paid to local governmental areas. It is common for constitutional provisions to forbid the crossing of county boundaries in the establishment of

representative areas. On the other hand, the principle of equal representation upon the basis of population has steadily developed. The more common plan today is to provide for the periodical reapportionment of membership in the two houses upon the basis of population. Delaware, however, permits a reapportionment only by constitutional change; and other states, while providing for periodical reapportionment, limit the basis of representation in such a manner as to preserve an inequality. In California, New York and some other states representation in one house is based on population and in the other in large part upon the counties as units, in an effort to balance urban and rural interests and to prevent domination of the legislature by a single large community.

Members of the state legislature are chosen from local districts by popular vote. Proportional representation has been proposed, but has not been adopted for the choice of members of state legislatures, although in municipal elections it has come to some use. All states adopt the plan under which a candidate is elected who receives a plurality of the votes in his district; though Illinois since 1870 has provided for three members of the lower house in each electoral district, and that each voter may vote for three or cumulate his votes for one or two candidates.

Under the first state constitutions provision was generally made for the annual election of members of legislative bodies and for annual legislative sessions. Frequent and regular sessions of the legislature were deemed essential safeguards of popular rights and were at this time thought sufficient safeguards. Most state legislative bodies now meet in January of odd years, and constitutions ordinarily prescribe the number of days for which the session may continue. Biennial sessions are held in even years in Kentucky, Louisiana, Mississippi and Virginia. Annual sessions are held in Massachusetts, New Jersey, New York, Rhode Island and South Carolina. Massachusetts adopted the plan of biennial sessions in 1938 and returned to annual sessions in 1944. Alabama and Mississippi experimented for a time with quadrennial sessions.

As is the case with congress, the work of state legislatures is largely done through committees. There is little of an effective legislative program or of organized leadership in the two houses. A number of states have in recent years sought to devise a more definite legislative policy through the creation of legislative councils, composed of representatives of the two houses, such council to remain continuously in existence and to consider important matters of legislation with the aid of a permanent body of experts. An efficient and influential governor occasionally exercises a distinct leadership in important matters of constructive legislation, but over legislative enactments in general his influence is negative rather than affirmative.

He now has a veto power over legislation in all of the states except North Carolina; and the veto can, in most of the states, be overcome only by a two-thirds vote, although only a three-fifths vote is required in some states, and a bare majority in others. There has also been a definite increase of the governor's control over appropriations, through the vesting in him of a power to veto items in appropriation bills. Such a power now exists in all but 10 of the states. There has been a tendency in some states to extend the governor's veto power still further. The Washington and South Carolina constitutions confer upon the governor the power to veto any item or section of a bill presented to him, and a similar power exists in Alabama. In addition, several states have recently given the governor wide powers with respect to the state budget.

The veto power is not an idle weapon in the governor's hands. Its use and effectiveness depend upon several factors—the extent of the governor's constitutional power, the personality of the governor and the political agreement or disagreement at the time between the governor and the two houses. Of about 16,500 measures passed in 1923, for example, by the legislatures of 44 states, more than 1,100 were disapproved in their entirety, and more than 1,000 parts of bills were disapproved. Of the bills disapproved, 104 were repassed by legislatures; and of the parts vetoed, only 40 were repassed.

State Executive.—In the first state constitutions the executive department was subordinate to the legislature. In most states, the governor and certain other state officers were chosen by the legislature; and an executive council, also chosen by the legislature, was substantially placed on guard to prevent executive usurpation. Such an attitude toward the governor was natural in 1776; but the governor's power almost immediately began to grow. New York in 1777 made its governor popularly elective, though it at the same time created two councils—the council of revision and the council of appointments—to share with the governor the powers of veto and of appointment to office. Massachusetts (1780) and New Hampshire (1784) followed with the plan of popular election. Executive councils now remain in Massachusetts, Maine and New Hampshire.

In all states the governor became a popularly elected officer and hence independent of legislative dominance. Other state officers became popularly elective, though some such officers are still chosen by state legislatures. Until late in the 19th century the functions of state government were few and were chiefly conducted by a small group of popularly elected officers. As new needs have developed, the constitution itself has provided for new offices, which have usually been filled by popular election. Illinois has six such officers in addition to the governor; Idaho and Nebraska, seven each. Chief among the state executive offices, independent of the governor in most states, are: lieutenant governor; secretary of state; superintendent of public instruction; attorney general; treasurer; and auditor, or comptroller.

By creating a group of state officers, all popularly elected in the same manner, state constitutions in fact create a plural executive, although the theory of state government presupposes a single head of the executive department. But only to a slight extent are constitutional powers directly conferred upon the lieutenant governor, secretary of state and other popularly elected state officers. The governor has thus had the opportunity to become the chief state executive in fact as well as in constitutional theory. The increase in the governor's executive power has come about primarily through the creation of new offices by statute and the vesting in the governor of power to appoint to such offices. In this manner, as new state functions were assumed, numerous offices were created, without reference to any efficient supervision by the governor. Some states had as many as 200 independent officers, most if not all of whom were appointed by the governor, but over whom it was physically impossible for the governor to exercise an effective supervision. A recent movement in the states has sought to organize executive functions into a small group of departments, each under a director appointed by and responsible to the governor. One of the chief difficulties in building up an effective state executive system is that the governors of half the states are elected for terms of only two years. In the other states the term is four years. There has, however, been an increase in state executive powers and leadership, but any possibility of leadership is greatly handicapped by the fact that the majorities of one or both of the two houses of the state legislature may often be politically opposed to the governor. This lack of political harmony is more common in the states than in the national government.

Unfortunately, most state governments are operated for the political advantage of the party or persons in control. In order to avoid such conditions, the state of Georgia, under the leadership of its governor, adopted a new constitution in 1945, placing control of education and of other important state functions in the hands of boards appointed by the governor for terms of such length that no one governor would control the membership of the board.

State Judiciary.—Generally the states have courts of three types:

1. Justices of the peace, having a limited and inferior jurisdiction in both civil and criminal cases. Justices of the peace are ordinarily elected from towns or townships or from districts created for the purpose within the county. The jurisdiction of justices of the peace is strictly limited by statute, and their courts are not courts of record. Appeals are allowed from their action to a court of general trial jurisdiction; and ordinarily the trial in the higher court is a trial *de novo*. The system of justices of the peace paid on a fee basis has not proved satisfactory and has been replaced in the larger communities. Virginia and Missouri have taken steps which may lead altogether to the abandonment of the system. To some extent a major defect in the system has been met by placing the justice of the peace on a salaried basis.

2. In all states there are courts of general trial jurisdiction, known as superior courts, district courts, circuit courts and in some states by still a different name. The court of general trial jurisdiction has ordinarily a general authority to try all cases in law and equity. Five states still retain the old English plan of separate courts for the trial of cases at law and in equity, but most of the states have abolished the distinction between law and equity. In some states, as in Arizona, California and Ohio, the court of general trial jurisdiction is organized upon a county basis, and there is a separate court for each county. The more common plan, however, is to have the court of general trial jurisdiction go on circuit from one county to another, at least in the smaller counties of the state.

3. Each state has a court of review, the function of which is chiefly that of hearing appeals from the courts of general trial jurisdiction. This court is ordinarily termed the supreme court. But in Kentucky, Maryland and New York it is called the court of appeals; and slightly different names are used in several other states. The highest court is usually given some original jurisdiction, but ordinarily this original jurisdiction is small, and its use is strictly limited by the court itself, in order that time may be available to hear appeals from other courts.

Once these three features are outlined, state judicial organization becomes to a large extent a mass of diversities. In many larger communities a municipal court has been organized, which not only replaces justices of the peace, but is granted a much more extended jurisdiction than has ever been conferred upon justices of the peace. In a number of states there is also a so-called county court, with some jurisdiction, both civil and criminal, and also usually a fairly large authority with respect to rather distinctly administrative matters, such as those relating to county affairs, elections and charities. Where county courts exist independently of the court of general trial jurisdiction, they are often vested with authority in probate matters as well.

There are also other types of trial courts with special jurisdiction. Every large community now has a juvenile court, and separate probate courts are not uncommon. Other specialized courts, such as domestic relations courts, morals courts, boys' courts, speeders' courts and small

claims courts have been established in many larger communities, often as branches of a municipal court. In some cases there are separately organized criminal courts, although ordinarily criminal jurisdiction is exercised by the courts of general trial jurisdiction. In all of the states the prosecution of criminal offenses is by and in the name of the state and is conducted by prosecuting attorneys, who are usually elected by the voters of the county.

The state judicial organization has placed great emphasis upon appeals from lower to higher courts. No case of any importance is regarded as settled until it has been taken to the highest court. Increased complexity of appellate court organization has been forced by the growing number of appeals to be heard. The increased mass of appellate work has been handled in three ways: (1) by increasing the number of judges of state supreme courts; (2) by authorizing such courts to sit in sections; and (3) by creating intermediate appellate courts, standing midway between the trial courts of general jurisdiction and the highest court.

There are now three methods of selecting judges in the United States: (1) In 38 states, with the exceptions hereafter noted in California and Missouri, judges of the highest court are elected by the people; in all of these states except one the trial judges are chosen in the same manner; (2) in four states the judges are elected by the legislature, and in one they are appointed by the legislature upon the nomination of the governor; (3) in five states the highest judges are appointed by the governor, subject to confirmation by the governor's council in Maine, Massachusetts and New Hampshire, and to confirmation by the senate in Delaware and New Jersey. Certain inferior judges in other states are also appointed by the governor.

A new plan adopted by California in 1934 removes that state from any one of the classes indicated above. The California plan, which applies to justices of the supreme court and of the district courts of appeal, provides that upon the expiration of the term of office of any such judge, such judge may file a declaration of candidacy to succeed himself. If he does not do so, the governor nominates a suitable person, subject to confirmation by a commission composed of the chief justice of the supreme court, the attorney general of the state and a justice of one of the district courts of appeal. The name of the candidate to succeed himself, or of the candidate nominated by the governor and confirmed by the commission, is then placed upon the ballot at the next general election and the electors vote upon the question as to whether he shall be elected. If a majority vote "yes" he is elected to or continued in office. Under this plan a candidate has no opposing candidate, but an election determines whether he shall become or remain a judge. By popular vote in any county the same plan may be adopted for the superior court judges of that county.

In 1940 Missouri adopted a plan similar to that of California with respect to judges of the supreme court, the courts of appeal and the circuit and probate courts in the city of St. Louis and Jackson county.

8. LOCAL GOVERNMENT IN THE STATES

What is ordinarily referred to as the "state government" is the central organization located at the state capital. But this central organization does much the smaller part of the work of the state. Unlike the national government, which establishes its central organization for substantially all national activities, the state conducts a large part of its governmental business through locally elected officers. There is no one system of local government for the 48 states or for any of these states. The geography of local government in each state is a patchwork, with the same territory often occupied by from ten to a dozen separate governing bodies, each with slightly varying boundaries and with independent powers. In the 48 states there are more than 160,000 local governing units, of which more than 3,000 are counties (parishes in Louisiana); nearly 19,000 are towns or townships; more than 16,000 are cities or villages; and more than 100,000 are school districts. In addition, there are more than 8,000 special units.

Certain types of organization may be termed the usual forms of local government. There are (1) the county, which is found in all of the states, though the name parish is employed for a similar unit of local government in Louisiana; (2) towns or townships, which in most of the states where they are found are merely subdivisions or units of the county, although the New England town was the original area for local government and is more important than the county; (3) the city. In addition to the city, which is theoretically the chief unit of local government for urban areas, most state laws provide for the incorporation of small communities as villages, with a simpler form of government than that provided or permitted for cities.

In addition to these usual types of local government, other forms will be found in each of the states. Park and sanitary districts in more settled areas, drainage and irrigation districts in rural communities, road districts, school districts and numerous others will be found oftentimes occupying the whole or a part of the same territory as that covered by the usual types. Aside from several New England states in which the county is merely a convenient area for direct state administration, county government has certain common characteristics. There is a locally elected county board, of varying size and composition, and there are a number of locally elected county officers who perform their duties largely without subordination to the county board, except as they may oftentimes depend upon the county board for appropriations. County boards are usually grouped into two classes: (1) small boards of commissioners elected at large by the county; (2) large boards elected by townships and cities within the counties. But in a number of states, counties are divided into districts for the election of a small county board. In each county will be found a clerk (or clerks) of court and a sheriff. Each county provides a courthouse and a jail. Locally elected county judges and county treasurers will ordinarily be found and a prosecuting officer elected by the voters of the county. In many states the county is a unit of school administration, and there is a county superintendent of schools, usually elected by the voters of the county. A movement is now actively under way toward a more centralized executive organization in the county.

The terms town and township are usually employed to designate areas of local government into which the county is divided, though in New England the town is the most important unit of local government. New England towns have areas of from 20 to 30 sq.mi., and usually include both rural territory and more compact village settlements. About three-fourths of them have less than 2,500 inhabitants each, and hence may properly be classed as rural communities. The large communities usually become incorporated as cities, and generally the creation of city government terminates the existence of town government within the city's limits. The town meeting is the chief organ of government in the New England towns.

So-called town or township systems of government are found in the great central group of states extending from New York to Nebraska. The forms of township government in these states may be classified as follows: (1) those which, as in New York, have the town meeting and township representation on the county board; (2) those, as in Minnesota, which have the town meeting but no township representation on the county board; and (3) those, as in Pennsylvania, which have merely a local township organization, but no representation on the county board and no town meeting.

Efforts have been made to introduce the township system in the states of the south and of the west, but in these states the counties are ordinarily divided into subordinate districts, largely for administrative purposes; and such districts, though sometimes called townships, usually have little, if anything, of independent authority in the field of local government.

The growth of urban population has naturally led to the development of cities as the chief agencies to meet local needs occasioned by more compact population. The chief forms of city government in the United States are primarily three: (1) the mayor-council, or federal, plan; (2) the commission plan; and (3) the manager plan.

The mayor-council, or federal, plan is still the most general. It is to a large extent organized upon the analogy of the national government. There is a popularly elected mayor with large powers, which have tended steadily to develop. The mayor normally has a veto power and a fairly large power of appointment; although several of the more important officers, such as clerk and treasurer, are usually elected by the voters of the city, just as is the mayor. There are ordinarily under the mayor a group of departments whose heads are appointed either by the mayor alone or by the mayor with the approval of the council. Usually there is a council composed of a single house, whose members are elected from wards into which the city is divided, although occasionally some or all of the members are elected from the city at large.

The fundamental characteristic of the commission plan of city government is an elective commission, usually of three or five members, having large municipal powers, both legislative and executive. Each of the commissioners is the head of a department, and there are as many main city departments as there are commissioners. Along with this system have come ordinarily the initiative and the referendum on municipal ordinances and a power to recall the members of the commission by petition and popular vote.

The so-called manager type of city government had its origin about 1908, though it first received serious consideration upon its adoption by the city of Dayton, O., in 1913. Nearly 1,000 cities in the U.S. are now governed under the manager plan. Under this plan there is a commission or council, whose members are usually elected from the city at large, oftentimes by the use of proportional representation. This body determines the policy of city government and selects a manager to administer the affairs of the city. Through the commission plan, which originated in 1901 and which for perhaps 15 years had great sway in U.S. city development, and through the manager plan, which originated in 1912 and has tended to replace the commission plan, much has been done since 1901 toward the reconstruction of city government in the U.S.

9. ELECTIONS AND POLITICAL PARTIES

The state government has the primary responsibility for the conduct of elections, national, state and local. State constitutions and state laws set up machinery for the conduct of elections, and determine the qualifications for voting, subject to the federal restrictions against discriminations because of race, colour, previous condition of servitude or sex.

Through a succession of changes, the states have now come to have substantially universal suffrage for males and females above the age of 21 years. Georgia in 1944 reduced the voting age to 18. Suffrage for women became national in 1920 through the adoption of the 19th amendment to the constitution of the United States. Educational

qualifications for voting have been imposed in some states, as in New York; and qualifications as to education or tax-paying have been imposed in a number of southern states, which discourage voting by Negroes. State laws require registration of voters in the larger communities to identify those qualified to vote.

Few officers are chosen by popular vote in the federal system—the president, vice-president, members of the two houses of congress and presidential electors are so chosen. A much larger group of state officers are chosen by popular vote and an even larger number of county, city and other local officers. When all of these types of offices are united on one ballot or in one election, the voter is at times faced with the problem of choosing 100 or more officials from among several times that number of candidates. Moreover the so-called initiative and referendum have been adopted in 18 states; constitutional amendments are proposed for popular approval by state legislatures; and under many state laws, proposals of municipal bond issues and other local questions must be submitted for popular approval. The voter is somewhat at a loss when forced to express himself upon perhaps 30 technical proposals and upon a large number of candidates for public office. His choice upon the measures submitted to him is largely haphazard, except upon the occasional measure of real importance. His choice among candidates for national, state and local offices is primarily guided by political parties.

Practically throughout its history, the United States has been a country of two parties. A third party has occasionally been important, as was the case with the Progressive party under the leadership of Theodore Roosevelt in 1912. In the early years of the nation, the Federalist party represented the interests of a stronger nationalism; the Republican party under Thomas Jefferson, the interests of the states. In the period of Andrew Jackson, the name of the then dominant party changed from Republican to Democratic; and, the Federalists having disappeared, the Whigs became the other great party. The Whigs were replaced by the Republicans, who elected Abraham Lincoln to the presidency in 1860. During all of this period lesser parties have existed and have occasionally cast a vote sufficient to determine which of the two major parties should control.

Political parties originated as voluntary organizations. But they soon came to control the election to local, state and national offices; for in the election no one except a candidate of one of the two leading parties had or has the possibility of being elected. The methods of the political party thus became of importance to the government itself. Today political parties are in reality no longer voluntary organizations but are rather organs of the government itself, controlled in great detail by state legislation. One of the first respects in which political parties came under official control was the printing of the ballot. Before 1888 parties printed their own ballots and naturally determined also the conditions under which the names of their party candidates should appear upon such ballots. Serious abuses arose under this arrangement, particularly with respect to the secrecy of the ballot. Beginning in 1888, the states adopted the official, or so-called Australian, ballot. Under the official ballot plan, ballots are printed at governmental expense. This expense is usually borne not directly by state government but by the local bodies charged by the state with the conduct of elections. In providing for the printing of ballots, state laws at the same time necessarily determine the conditions under which party organizations shall be entitled to have the names of their candidates appear upon such ballots.

But with the adoption of the so-called Australian ballot political parties still had, and have, sufficient power to determine the form of that ballot. Massachusetts and a few other states have adopted a plan under which the names of the candidates are grouped under the titles of the offices; though under the Massachusetts plan the party to which each candidate belongs follows the name of the candidate. This arrangement of the ballot makes it necessary for the voter to mark separately on his ballot the name of each candidate for whom he desires to vote. Most of the states, however, have adopted the so-called "party-column" ballot. The party-column ballot varies in different states, but its fundamental idea is that all of the candidates for one party shall appear in a single column so that a voter may vote for all of them by placing one mark upon the ballot. If the voter does not wish to vote the party ticket, he is put to the burden of marking each of the candidates for whom he wishes to vote, or at least each candidate not belonging to his own party.

The methods of party nomination next came under state control. Serious abuses in the party convention system for the nomination of candidates and the framing of party platforms led to legislation regulating the convention; but such regulation did not appear sufficient. The primary election system (*see* PRIMARIES) has now been established in some form in all but two of the states, although recently there has been a strong political movement against primary elections and some gain for the older convention system. Where the primary system has been adopted, conventions normally remain, with more limited functions.

Control by law over the official ballot and over the methods of party nomination has naturally been followed by a detailed regulation of the machinery of party organization. Through primary elections, the party voters in most of the states choose their party committeemen. State laws determine the power of such party committeemen and also determine the manner in which they shall form the various party governing bodies. State laws also determine how party organizations shall frame platforms. Governmental regulation of political parties has largely been occasioned by a feeling that party organizations themselves control the government and that they should, rather, be controlled by the government. But governmental regulation has not weakened political parties.

When it is first created, a party usually stands for some political principle as opposed to other parties. Ordinarily, however, parties are merely convenient devices for the operation of government and for presenting political issues to the voters when such issues arise. Political issues are not created merely by the existence of two opposing parties; and during much of the time no real issues exist upon the basis of which parties may oppose each other. At such times parties proclaim principles, but have no sharp differences. When issues are altogether absent, parties still perform the functions of narrowing the choice of the voter and of uniting candidates into groups for final elections.

The political expert (who is termed "boss" if sufficiently successful) has the tasks of keeping the party organization together, getting party members to the polls and rewarding political service. He can perhaps be more successful if he holds no office, because by holding office he divides his energies and subjects himself to personal criticism for possible errors of political conduct. Each political group has its precinct and ward committeemen, who are normally on the public pay roll (local, state or national), if their group is in power, and whose continuance on that pay roll depends upon their efficiency, not as public employees, but in controlling the vote of the precinct or ward. The spoils of office and the grosser forms of political corruption are the lesser coin of political organizations. Gross corruption reacts upon those who practice it. But there are contracts to be let, without too great an insistence on standards, and other similar opportunities for continuous profit. Furthermore, important business and professional interests in a community usually co-operate with the organization in return for special favours.

With party organization a vast and complex mechanism, nomination and election to office almost of necessity come, in most cases, as a reward for service in the party organization. No man or woman who lacks the support of a party organization has much opportunity either to be nominated or elected, though an independent candidate may occasionally win, in case of great popular upheaval. Even under such conditions, the independent candidate who wins must almost necessarily have financial resources sufficient to set up a rival organization of his own. Many states have enacted statutes limiting expenditures of candidates in party primaries and in elections, but such laws have not been effectively enforced. When enforced, they operate in favour of the candidate sponsored by the political organization. Those who come to office usually do so only after a long apprenticeship in party service.

The recognition that national parties should not control in the election of local and judicial officers has led to a movement for nonpartisan elections. In a number of states judicial officers are nominated and elected through ballots required to contain no party designations. But a candidate must actually be sponsored by a political organization if he is to fare well in any election. The nonpartisan election has accomplished more in municipal than in state elections.

Parties are organized on the basis of national issues. Few such issues are important in state government and fewer still in local government. But the party organization, though national in scope, supports itself largely through the offices and other profits derivable from state and local government. In spite of the movement for nonpartisan elections, it is still possible to apply to the U.S. party system the statement made by James Bryce in the 11th edition of the *Encyclopædia Britannica:*

"The national parties have been so pervasive in their influence, and the working of their machinery has formed so important a part of the political history of the United States, that it is necessary here to call attention to the high significance of this element in the system of the Republic. The party system has made nearly all elections, including those for state offices and city offices, the functions of which have, as a rule, nothing whatever to do with national party issues, matters of party strife fought upon party lines. It has disposed voters in state and city elections to support party candidates, of whom they might otherwise have disapproved, for the sake of maintaining in full strength for national purposes the local party organization, and it has thereby become a fruitful source of municipal misgovernment. It has thrown great power into the hands of party managers, because where the strife between the two great parties is keen and the result of a contest doubtful, discipline and obedience are deemed needful for success. It has tended to efface state lines, and to diminish the interest in state issues, and has thus helped to make the nation overshadow the states."

The democratic movement in the United States places upon the voter the duty of electing numerous officers of whose qualifications he cannot have knowledge and of expressing an opinion upon numerous measures of whose merit he cannot be informed. The most intelligent citizen, devoting all of his time to public affairs, would in a large number of cases, of necessity, cast an unintelligent ballot. But the functions so imposed upon the voter must be exercised, and the political party has been devised for their exercise. So long as the voter is asked to vote too much, party organization rather than political principles will dominate U.S. policies, except in the occasional case where the issue as to a candidate or a principle becomes sufficiently

important to force the party organization into the background.

X. HISTORY

BEGINNINGS OF SELF-GOVERNMENT, 1578-1783

The American nation owes its origin to colonizing activities in which the British, Dutch, Swedes, French and Spaniards bore a share, and which were continued during a period of more than two centuries at the beginning of the modern era. The settlements of the Dutch and Swedes (New Netherland and New Sweden) were soon merged in those of the British, and of the territory colonized by Frenchmen and Spaniards the United States, as it was in 1783, included only certain outlying regions. All the European nations which were interested in colonization shared in the enterprise, and the population of the region was therefore cosmopolitan from the outset; but the British, especially after 1660, secured a controlling influence.

Permanent settlements on the Atlantic seaboard were first made in the early years of the 17th century, and they continued steadily to increase until after 1680. Relatively speaking, that was the period of settlement, but population continued slowly to advance westward. In the 18th century occurred a large immigration of Germans and Scottish-Irish, who settled in Pennsylvania and New York and thence overflowed into the western parts of Virginia and the Carolinas. The only Colony founded in the 18th century was Georgia (1732), by means of which British outposts on the Florida frontier were strengthened.

General Aspects of Colonization.—British colonization originated chiefly in private initiative, though it acted in half-conscious obedience to certain general principles. To this fact is due the trend toward self-government, which was fundamental and controlling in the history of the British on the American continent. But to an extent the tendencies which favoured self-government were counteracted by the influence of the British Crown and parliament. The influence of the Crown was continuous, except during the period of the Civil War and Commonwealth (1642–60), while that of parliament was not felt until the middle of the 17th century, and its colonial legislation subsequent to that time was chiefly confined to matters of trade. The activities of Crown and parliament were directed toward the securing of imperial interests and of that degree of subordination and conformity which, in States that have developed from Roman and feudal origins, attaches to the condition of colonies or dependencies. The term "imperial control" therefore suggests the second tendency in colonial affairs, to the discussion of which the historian must address himself.

Among the colonists the trend toward local independence and self-government was in harmony with the spirit of the English. Neither was it lacking among the other nationalities represented in the Colonies. But in the case of the British it was greatly strengthened by the fact that the Colonies were founded by private initiative, the government legalizing the efforts of the "adventurers" and planters, but leaving them in many cases almost wholly to themselves. Hence many small Colonies and settlements were founded. A variety of motives—economic, religious and political—contributed to the founding of these Colonies, and naturally people correspondingly different in type came to inhabit them. The remoteness of the Colonies from Europe and the difficulties under which communication with them was maintained confirmed and perpetuated the tendency toward independence. Somewhat similar conditions controlled intercolonial relations, kept the colonists apart from one another and checked co-operation. Thus it was that the causes which confirmed the colonists in the spirit of independence toward the mother country also made them jealous of external authority.

Chartered Colonies.—The term "chartered Colonies" is the one which best describes the forms under which the British-American settlements were founded and under which they all continued for varying periods. They were the direct and characteristic results of private initiative. The discoverers and would-be colonizers, acting individually or in groups, collected the ships, men and resources necessary for their enterprises, and procured from the Crown a charter. By this document the King conveyed to them a claim to the soil which would be valid in English law, gave them the right to transfer Englishmen thither, to trade with them and with the natives, and to govern the Colony, subject to the conditions of allegiance and of British sovereignty in general. The rights and liberties of the colonists as British subjects, without attempt to define what they were, were guaranteed by the charters, and the grantee was prohibited from passing laws or issuing orders which were repugnant to those of England. In only a part of the charters—those chiefly which were issued subsequent to 1660—was express reference made to the calling of assemblies. So general were the provisions of the charters that they only remotely determined the forms which government should assume and what the rights of the colonists should be. A considerable variety of institutions and social types existed under them. But their very indefiniteness made them valuable as objects of appeal to those who in time of controversy were upholding local rights and liberties.

London and Plymouth Colonies.—Of the chartered Colonies there were two varieties—proprietary provinces and corporate Colonies. Though alike in the fact that the patentees who founded them were mesne tenants of the Crown, they were quite unlike in their internal organization and to a considerable extent also in the character of the people who inhabited them. The proprietary province was a development from the principle of the fief, though with many variations. The early charters of discovery, those for example which were granted to John and Sebastian Cabot and to Sir Humphrey Gilbert, contemplated the founding of feudal principalities in the New World. The grant to Sir Walter Raleigh, which resulted in the abortive colonial experiment at Roanoke, was of the same character. At the period of transition from the rule of the Tudors to that of the Stuarts, trading companies and companies for colonization were increasing in number and importance. The joint companies which were chartered by James I in 1606, one to have its residence at London and the other at Plymouth, were of this character. They were granted the right to colonize, the one in northern and the other in southern "Virginia"; the intervening territory, three degrees in breadth, being left common to the two. The rights of the companies were confined to settlement and trade. The Plymouth patentees achieved no permanent result; but those of London founded Jamestown (1607) and other settlements along the James river, which later became the province of Virginia.

But before this result had been reached the London patentees had secured in succession two new charters, one in 1609 and another in 1612. By means of these grants they had practically separated from the Plymouth company, had secured a concession of territory 400 mi. broad and extending through the con-

tinent, and had been able to perfect the organization of their company. By the grant of 1606 the right to govern the Colonies had been reserved to councils of royal appointees, but by their later charters the London patentees were fully incorporated, and in connection therewith received not only the power to grant land but rights of government as well. This made the Virginia Company of London the proprietor of the province which it was founding. It now appointed resident governors, councillors and other officials and instructed and controlled them in all ways, subject of course to the general supervision of the King in council. Under the charter of 1606, in order to facilitate colonization on a strange continent, joint management of land and trade was temporarily instituted. But under the fully organized company this system was abandoned, and private property in land and the control of trade through private "magazines" were established. A number of distinct plantations and settlements were founded. From these localities, in 1619, under authority from the company, representatives were elected who met with the governor and council at Jamestown and formed the first colonial assembly held on American soil. Its acts were duly submitted to the company in London for its approval or disapproval. Other assemblies were called, the tobacco industry was established and the principles upon which traffic in that staple was to be conducted with Europe were announced. Thus Virginia assumed the form of a proprietary province, with an English trading company as its proprietor.

New England Council.—Meantime west of England men had been making fishing voyages and voyages of discovery to northern "Virginia," which now was coming to be known as New England. In 1620 a new charter was procured, the reorganized company being known, in brief, as the New England Council. Like the London patentees, this body was now fully incorporated and received a grant of the vast territory between 40° and 48° N. lat. and extending through to the South Sea (Pacific). Full rights of government, as well as of trade and settlement, were also bestowed. The moving spirit in this revived enterprise was Sir Ferdinando Gorges (*q.v.*), an Anglican and royalist from the west of England. For a time John Mason (*q.v.*) was his most active coadjutor. Such backing as the company received came from nobles and courtiers, and it had the sympathy of the court. But lack of resources and of active interest on the part of most of the patentees, together with the development of a Puritan interest in New England, led to the failure of this enterprise. No Colony was established directly by the council itself, but that part of its vast territory which lay adjacent to the coast was parcelled out among the patentees and by them a few weak and struggling settlements were founded. They were all proprietary in character. But, as events proved, Plymouth Colony (founded in 1620), which was Puritan and Separatist to the core, became a patentee of the New England council; and the Colony of Massachusetts Bay (founded 1628–30), which was to become the citadel of Puritanism in America, procured the original title to its soil from the same source. At the outset both Massachusetts and Plymouth must be classed as proprietary settlements, though far different from such in spirit and destiny. Massachusetts soon (in 1629) secured a royal charter for its territory between the Merrimac and Charles rivers, and thus took a long step towards independence of the council. At the same time the Plymouth settlers were throwing aside the system of joint management of land which, as in the case of Virginia, had been imposed upon them by adventurers who had lent money for the enterprise; were paying their debts to these same adventurers; and were establishing a system of self-government similar to that of Massachusetts. Thus a strong Puritan interest grew up in the midst of the domain granted to the New England council, and in connection therewith the type of colony to which we have given the name corporate came into existence.

Corporate Colonies.—In order to understand the nature of the corporate colony, it is necessary to explain the internal organization of that type of company which, like the Virginia Company of London, was founded for purposes of trade and colonization. It was composed of stockholders, who became members as the result of the purchase of shares or of migration to the Colony as planters, or of both acts combined. In the Virginia company they were known as the "generality," in the Massachusetts and other companies as the "freemen." In them, when met as a democratically organized body under the name of "quarter court" or "general court," was vested the governing power of the company. It elected the officers, chief among whom were a treasurer or governor, and a council or board of assistants. These, as well as the subordinate officers, held annual terms only. Membership in such companies might be indefinitely increased through the issue and sale of shares. They were, in other words, open companies, whereas the New England council was a closed body, its membership being limited to 40.

Massachusetts.—In 1629 the prospects of Protestantism at large, and of Puritanism in England, were so dark that the founders of the Massachusetts company, who were decidedly Puritan in spirit and inclined to nonconformity in practice, resolved to remove with their charter and the governing body of their company into New England. Preparatory to this, John Winthrop was elected governor and a settlement was made of their business relations in England. After the removal had been made, the assistants and general court met in New England and business was carried on there exclusively by planters. An order was soon passed that none should vote or hold office who were not members of some one of the churches within the Colony. As all these churches were Independent or Congregationalist in form and doctrine, this order gave a wholly new definition to the term "freemen." It made of this colony something approximating to a biblical commonwealth, and subordinated trade, landholding and settlement to the interests of the Puritan faith. As local settlements about Massachusetts Bay were founded, the general court, which before had been a primary assembly—simply the freemen of the company—came to consist partly of representatives elected by the freemen of the towns. In this way a second chamber—that of the deputies—was added to the assistants to form the general court of the Colony. Taxes were levied by this body, and laws and orders proceeded from it which related to all functions of government. It elected or appointed the governor and other chief officials.

Of primary importance in the affairs of the Colony was everything which concerned religious belief and church government. The churches and their relation to the civil power presented the great questions upon which hinged its policy. This was true not only in its internal affairs, but in its relations with other Colonies and with the mother country. An ecclesiastical system was developed in which Independent and Presbyterian elements were combined. By a rigid system of tests this was upheld against Antinomians, Baptists, Quakers and dissenters of all sorts.

Connecticut and Rhode Island.—As a consequence of the Puritan migration from England and of the expulsion of dissenters from Massachusetts, Plymouth and Connecticut, the New Haven Colony, and the towns about Narragansett Bay which became the Colony of Rhode Island were settled. These all were corporate Colonies, organized upon fundamentally the same plan as Massachusetts. Their settlers at the outset had no charters, but by means of plantation or town covenants assumed powers of government, which ultimately were vested in general courts similar to that of Massachusetts. Rhode Island was formed by a union of towns, but elsewhere the Colony was coeval with or antedated the town. Connecticut and Rhode Island, in 1662 and in 1663 respectively, secured royal charters by which they were incorporated within New England itself and the governments which they had established there were legalized. New Haven was absorbed by Connecticut in 1664 under the charter of 1662 and Plymouth remained without a charter from the King until, toward the close of the 17th century, it became a part of the enlarged province of Massachusetts.

The most prominent feature of the New England land system was the "town grant," which in every case became the territorial basis of a group settlement. Throughout New England, and in the outlying districts which were colonized by New Englanders, settlement was effected by groups. The process began in Ply-

mouth and was extended through the entire section. The Puritan migration from Europe was of the same general character. Groups of people, animated by a common religious or political ideal, broke away from their original or temporary abiding-places and pushed farther into the wilderness, where tracts of land were granted to them by the general court.

Over the founding of towns the general courts, as a rule, exercised a watchful supervision. Not only did the courts fix and maintain their bounds, but they issued regulations for the granting of lands, for common fields, fences, herds, the punishment of trespass, the admission of inhabitants and freeholders, and the like. But subject to these general regulations, the allotment and management of its land was left to each town. The Colonies had no land system apart from the town. It was partly in order to manage their lands that the towns were made centres of local government and town meetings or boards of town proprietors were established. By means of town action, taken in town meetings and by local officials, the land of each settlement was laid off as house lots, common and common fields, meadow and pasture. Detailed regulations were made for the management of common fields and for their ultimate division and allotment among their proprietors. The same was true of fences and herds. The result was an organization similar to the English manor, but with the lord of the manor left out. To this peculiarity in the form of New England settlement is due the prominence of the town, as compared with the county. The town was the unit for purposes of taxation and militia service as well as of elections. It was also an important ecclesiastical centre.

As a result of the process thus sketched, southern New England was settled by a population of English origin, with similar instincts and a form of political organization which was common to them all. Gorges, meantime, had secured (1639) a royal charter for his province of Maine, but Mason had died before he obtained such a guaranty for his settlements on the Piscataqua river. The small communities along that entire coast remained weak and divided. In 1635 the New England council surrendered its charter. The helplessness of the Gorges family was insured by its adherence to the royalist cause in the English Civil War. Massachusetts availed itself of a forced interpretation of the language of its charter respecting its northern boundary to extend its control over all the settlements as far N.E. as the Kennebec river. This was accomplished soon after 1650, and for the time Anglican and royalist interests throughout New England seemed hopelessly wrecked. New England had thus developed into a clearly defined section under Puritan domination. This fact was also clearly indicated by the organization, in 1643, of the New England Confederacy, or the United Colonies of New England (*see* NEW ENGLAND).

Middle and Southern Colonies.—The Colonies of the middle and southern sections of the territory which later became the United States were wholly proprietary in form. This was true of New Netherland (founded by the Dutch West India Company in 1621) and of New Sweden (settled under the authority of the Swedish Royal Company in 1638), as well as of the English Colonies. In the case of Virginia and of the Dutch and Swedish settlements, trading companies were the proprietors. But the later English Colonies, beginning with Maryland in 1632, and continuing with the Carolinas (1663), New York (1664), New Jersey (1665), Pennsylvania and the Lower Counties, afterwards Delaware (1681), were founded by individual proprietors or proprietary boards. Georgia (1732), the only English Colony settled after 1681 on the continent, existed for 20 years under a proprietary board of trustees. By the efforts of adventurers of this class, put forth chiefly during the period of the Restoration, the entire coast-line from Florida to Acadia was permanently occupied by the English. But, unlike New England, the population was of a mixed character, as were the economic and religious systems, and to an extent also the political institutions.

As has already been stated, in their internal structure and in the course of their history the proprietary provinces differed very materially from the corporate Colonies. Those of later English origin also differed in some important respects from Virginia under the company and from New Netherland and New Sweden. The system of joint management of land and trade, which was so characteristic of early Virginia, was outgrown before the other proprietary provinces were founded. Neither did it prevail in the Dutch and Swedish provinces.

In the proprietary province the proprietor, or board of proprietors, was the grantee of powers, while in the corporate Colony it was the body of the freemen organized as an assembly or general court. He might exercise his powers in person, or, as was usually the case, delegate them to one or more appointees. In any case, the form of government of the proprietary province was essentially monarchical in character. The powers that were bestowed were fundamentally the same as those which were enjoyed during the middle ages by the counts palatine of Chester and Durham. The normally developed provinces which resulted were miniature kingdoms, and their proprietors petty kings. This character arose from the fact that the grantee of power was the executive of the province. This branch of government was thereby brought into the forefront. At the beginning and for a long time thereafter it continued to bear the leading part in affairs. It was not so in the corporate Colony, for there the freemen and the general court stood at the centre of the system. In most of the corporate Colonies the executive was strong, but that was due to the political and social influence which its officials had gained, and not to their tenure of office.

Proprietary Colonies.—In every case, apart from the ordinary rights of trade and the guarantees of the liberties of the colonists, the powers which were bestowed on the proprietors were territorial and governmental. The territory of the provinces was granted under the conditions which by English law controlled private estates of land. An entire province, or any part of it, could be leased, sold or otherwise disposed of like a private estate. It was an estate of inheritance, descending to heirs. The attitude of proprietors toward it was that of landlords, investors or speculators in land. They advertised for settlers, and, in doing so, an ever present motive with them was the desire to secure more private income from land. In 1664 the duke of York sold New Jersey to Berkeley and Carteret, and the sale was effected by deeds of lease and release. In 1708 William Penn mortgaged Pennsylvania, and under his will devising the province legal complications arose which necessitated a suit in chancery.

In all the later proprietary charters, except that of New York, the operation of the statute *Quia emptores* was suspended, so far as relations between the proprietor and his immediate grantees were concerned. By virtue of this provision each proprietor, or board, became the centre from which originated an indefinite number of grants. These were held directly of the proprietor and through him of the Crown. In practice the same was true also of New York. The proprietors were thus left free to make grants on such conditions as they chose. Preparatory to the exercise of this power, the proprietors issued so-called "concessions" or "conditions of plantation," stating the terms on which they would grant lands to colonists. Under a system of head rights, analogous to that which existed in Virginia, land was thus bestowed on settlers upon easy terms. Proportional amounts of land were granted upon the importation of servants, and in this way a traffic in servants and their head rights to land was encouraged among planters and masters of merchant vessels. In all the provinces, except New Netherland, a quit-rent was imposed on all grants. In the Dutch province rents were sometimes imposed, but they varied in character and differed from the English quit-rent. In Maryland fines were levied on alienations. In Maryland and Pennsylvania the demand for land became so great that it was sold.

In all the provinces territorial affairs were administered directly by the provincial authorities, and not by towns as in New England. In Maryland a land office was fully organized, towns developed only to a very limited extent, and when they did originate they were in no sense village communities. Lots in them were granted by provincial authorities and they were subject to a quit-rent. They were simply more densely populated parts of the counties, and, unless incorporated as boroughs, had no distinct

institutional life. In almost all cases land, in the provinces, was granted to individuals, and individual ownership, with direct relations between the owners or tenants and the proprietary authorities, was the rule.

Had governmental powers not accompanied the territorial grants, these grants would have been estates of land, unusually large, no doubt, but nothing more. In cases where the governmental rights of proprietors were suspended or resigned into the hands of the Crown, they remained thereafter only private landlords. But the rights of government bestowed with the land made the territory a province and the proprietor its political head.

The provincial charters made the proprietors of the proprietary provinces the executives of their provinces and for the most part left it to them to determine how and under what forms the governmental powers which they had received should be exercised. The powers which were definitely bestowed were executive and judicial in character, giving to the proprietor an importance, especially at the outset, which was comparable with that enjoyed by the general courts in the corporate Colonies. It made him in a derived and inferior sense the source of office and honour, the fountain of justice, the commander of the militia, the recipient of the provincial revenue, the constituent part of the legislature. But in most cases the proprietors did not attempt to exercise these powers in person. By means of commissioners they appointed a group of leading officials for their provinces, as a governor, councillors, a secretary, surveyor general, receiver general or treasurer, and somewhat later an attorney general. These all held office at the pleasure of the proprietor.

The Governor.—The governor was *par excellence* the agent for the proprietor for all purposes of administration. In making appointments the proprietor was usually guided by the governor's recommendations. In some cases he was a relative of the proprietor; family influence in Maryland after the Restoration came to dominate the government of the province. In all his important acts the governor was required to take the advice of his council, and that body was expected to co-operate closely with him, but the governor was not bound to follow their advice. The relations between the two were the same as that between the King and his privy council in England. As settlements multiplied and counties and other local subdivisions were formed, other and inferior offices were created, the right of appointment to which rested with the governor. By means of an executive, thus organized, land was granted and the revenue from it collected, counties and other local divisions were established, early preparations were made for defence, courts were opened and the administration of justice begun.

In the later proprietary charters generally, with the exception of that issued to the duke of York, provision was made for assemblies. It was made, however, in very general terms, and it was left to the option of the proprietors to determine when, where and how they would call them. These legislatures did not originate in the natural or pre-existent rights of Englishmen, nor did the existence of a parliament in England make them necessary, though it greatly increased the difficulties of governing the Colonies without them. These legislatures were immediately proven to be indispensable and their activity in the provinces gradually opened the way for the growth of modern democratic institutions.

The Legislature.—When met in regular form, the provincial legislature consisted of the governor, the council or upper house, and the assembly or deputies. These deputies, who were elected by the localities, constituted the only representative part of the legislature. In tenure and functions the governor and council were largely independent both of the deputies and of the electors. They were a part of the executive and were naturally swayed by a regard for the interests of the proprietor and by administrative traditions. In many cases the importance of the councils was increased by the fact that, with the governor, in early times they formed the highest judicial tribunal in the province. As the governor had the sole power of calling, proroguing and dissolving the general assembly, the council might advise him in such a way as to destroy the body itself or thwart its plans. The joint work of the council and assembly was subject to the veto of the proprietor, or of both the proprietor and his governor. The legislature of the province, therefore, differed materially from the general court, though in practice this was somewhat offset by the fact that in the New England Colonies the magistrates were usually re-elected for a long series of terms.

In the province, as in the kingdom, the legislature was in a sense an expansion of the executive, developed out of it, and was to an extent controlled by it. Out of this relation arose the possibility of conflict between the two parts of the legislature—that which represented the people and that which represented the proprietor. In the history of the provinces this formed the central line of cleavage. From the first the assemblies largely controlled taxation. Using this as a lever, they endeavoured to limit and define the powers of the executive and to extend the sphere of legislation more widely. Fees, from which officials derived most of their support, were a favourite object of their regulation. Occasionally offices which had originally been appointive were made elective. Protests of various kinds were made against official cliques. Now and again the lower house came to a deadlock with council or governor. Threatened or actual revolt was sometimes necessary to bring the executive to terms. By such tactics as these the popular elements in the constitutions of the provinces asserted themselves. The sphere of ordinance was gradually limited and that of statute extended.

Constitutions.—In a number of provinces—the Carolinas, New Jersey and Pennsylvania—the proprietors at various times initiated elaborate constitutions, in which not only a land system, but forms and functions of government were prescribed on a large scale. These were variously known as fundamental constitutions, concessions and agreements, and frames of government, and in every case were submitted to the general assembly for its acceptance or rejection. Long struggles often ensued over the question of acceptance, which usually ended in the modification or rejection of the schemes.

Course of Development.—The history of these provinces was not uniform. In New Netherland and New York occurred a struggle for the establishment of a legislature, which continued at intervals for 40 years and was not permanently successful until after New York had become a royal province. The proprietors of New Jersey never secured a royal charter, and therefore were not able to establish satisfactorily their claim to rights of government. Within the vast reaches of the Carolina grant developed two provinces. One of these—North Carolina—was almost entirely neglected by the proprietors, and the weakened executive repeatedly succumbed to popular violence. In South Carolina many violent controversies occurred, especially over the efforts of the proprietors to compel the acceptance of the Fundamental Constitutions, which originated with Locke and Shaftesbury. But in the end this failed, and a simple form of government, such as was adapted to the needs of the province, was developed. In Pennsylvania the liberal policy of the proprietor led at the beginning to unusual concessions in favour of the colonists, one of the most characteristic of these being the grant of an elective council. The total neglect of provision for defence by the Quaker province led to the suspension of Penn's powers of government for about two years after the English Revolution and the outbreak of the war with France. This did away with the elective council for the time, and an appointive council was soon substituted. Finally, in 1701, the council was deprived of its powers of legislation and thereafter the legislature of Pennsylvania consisted of only one house—the assembly.

Imperial Control, 1606–1760.—Imperial control over the Colonies, it is to be noted, proceeded chiefly from the English Crown. It was exercised through the secretary of State, the privy council and a succession of boards subordinate to it which were known as commissioners of plantations or the board of trade; by the Treasury and Admiralty boards and their subordinate bureaux; by the attorney general and the solicitor general and by the bishop of London. The more continuous and intimate supervision proceeded from the privy council and the commissioners subordinate to it, and from the Treasury board

which caused the auditing of such revenue as came from the Colonies, supervised expenditures for them and had an oversight over appointments in the colonial service. The privy council received letters and petitions on almost every kind of colonial business, caused hearings and inquiries to be held, and issued letters, instructions and orders in council on an equally great variety of matters. It also acted as the regular court of appeal for the plantations. As time advanced, more of the administrative business passed directly into the office of one of the secretaries of State and the privy council became less active. The Admiralty was concerned with the equipment of the navy for service in the Colonies, and the high court of admiralty with the trial of prize cases and of cases arising from violations of the acts of trade. The bishop of London had supervision over the appointment and conduct of clergymen of the English Church in the colonies and over parish schools there.

Parliamentary Control.—The parliament by mentioning the dominions in its statutes could extend their provisions to the colonies. The early acts of supremacy and uniformity contained such reference, but it was dropped after the Restoration and no serious attempt was ever made to enforce uniformity in the Colonies. Parliament did not begin to legislate seriously for the colonies until after the Restoration. Then the acts of trade and navigation were passed, to which additions were made in the reign of William III. and from time to time during the 18th century. This body of legislation comprised the most important acts relating to the Colonies which were passed by Parliament. A few statutes relating to military affairs were passed about the middle of the 18th century. About 100 statutes in all were passed prior to 1760. The colonists themselves imitated in a general way the organization and procedure of the English courts. The main features of the common law came spontaneously into force in the Colonies. The legislatures of several of the Colonies adopted large parts of the statute law of England. The colonists were always accustomed to avail themselves, as far as possible, of the great English statutes which guaranteed liberty. After about 1690 the obligation was very generally enforced upon the Colonies of sending the acts of their assemblies to England for acceptance or rejection by the King in council.

But this, though far-reaching, was only one of the objects which were sought through the exercise of imperial control. Its chief object was to maintain the rights of Great Britain over the Colonies and her interests in them in all respects. The diplomacy of Great Britain concerned itself to an increasing extent, as the 18th century advanced, with the acquisition or losses of colonial territory, with the fixing of boundaries and with the securing of commercial interests. The interests of trade, more than any other subject, determined the colonial policy of England. The church and her interests also demanded attention. In all these matters the English executive—the Crown—continuously, and for the most part exclusively, managed colonial affairs. During the Commonwealth in the 17th century, parliament was the source of all activity, whether legislative or executive, but at other times its legislation was confined chiefly to the subject of trade.

Isolation of the Colonies.—A natural condition which affected colonial administration as a whole and to a large extent determined its limits and character was the remoteness of the Colonies from England. At best three months were required for sending a dispatch from London to America and procuring a return. This explains the large degree of self-government which the Colonies possessed and the indifference with which their affairs were usually viewed, even by British officials. Only a relatively small part of colonial business came before English officials or received their serious attention. Only at long intervals and in summary fashion was it brought to the attention of Parliament. It is believed that the affairs of the continental Colonies were never seriously debated in Parliament until after the beginning of the controversy which led to the American War of Independence. Social and political intercourse with the colonists and governmental control over them were therefore very imperfectly developed. In fact, the control over them was almost wholly executive, and during most of the period it was to a degree unintelligent and weak; in fact it was something more resembling a federation.

Chartered Colonies.—The central fact in colonial history during the 17th century was the development of the chartered Colonies. At their founding, as we have seen, the Crown delegated rights of settlement and subordinate rights of government to proprietors, who used them in a variety of ways. The effect of this was to introduce a number of mesne lords between the king and his colonial subjects, a phenomenon which centuries before had vanished from England itself. The patentees governed the colonists, and the Crown interfered only at intervals to adjust matters. Under the first two Stuarts some rather desultory efforts were made to check the development of such a system in the early stages. After a controversy over a contract for the sole importation of tobacco, which became involved with the political struggles of the time in England, the charter of the Virginia Company of London was revoked (1624). A royal commission was appointed to readjust the affairs of Virginia and to inaugurate its government as a royal province. In 1634 a board of commissioners of plantations was created and it received very large powers over the Colonies. The year following the New England council resigned its charter, a writ of *quo warranto* was issued against the Massachusetts charter, and a plan was nearly perfected for sending out Sir Ferdinando Gorges as royal governor, or rather governor general, to New England. But means were lacking, the suit against the Massachusetts patent failed to accomplish its purpose, and troubles at home soon absorbed the attention of the Government.

During the Great Rebellion in England New England was left practically to itself. Strife broke out in Maryland, over which the home Government was scarcely able to exercise even a moderating influence. The Dutch from New Netherland and Europe were able to monopolize a large part of the carrying trade in tobacco and European goods. Virginia assumed an attitude of distrust or hostility toward the new Government in England. In 1651 and 1652 Parliament sent out a commission, with an armed force, which adjusted affairs in Virginia by suspending Government under Sir William Berkeley, the royalist governor, and leaving control in the hands of the assembly. By a stretch of power the commissioners also took control of affairs in Maryland, but there they intensified rather than allayed the strife. Baltimore, however, managed to save his interests from total wreck, and at the Restoration was able to re-establish his authority.

Navigation Acts.—During this time of unstable government in England the seeds were planted of a colonial policy which was henceforth to dominate imperial relations. It was then that England entered upon the period of commercial rivalries and wars. The Cromwellian Government determined to wrest the control of the carrying trade from the Dutch, and the Navigation Act of 1651 and the first Dutch War were the result. Gen. Robert Sedgwick was sent against New Netherland, but ended in attacking Acadia. At this time also the national hatred of Spain, which had so characterized the age of Elizabeth, reasserted itself and the Spanish seas were invaded. In connection with these events plans were formed for a more systematic colonial administration, which Cromwell did not live to execute, but which were taken up by Clarendon, the duke of York, the earl of Shaftesbury and a large group of officials, lawyers and merchants who surrounded them. They took definite shape after the Restoration in the creation of a council for trade and a council for foreign plantations, in the passage of the acts of trade, in the conquest of New Netherland, in the settlement of the Carolinas, and in a resolute attempt to adjust disputes in New England. These events and their consequences give greater importance to the next three or four decades than to any later period until the colonial revolt.

The council for foreign plantations was continued, sometimes under a patent and sometimes as a committee of the privy council, until in 1696 it was commissioned as the board of trade. As a board of inquiry and report, subordinate to the privy council, the most important business relating to the Colonies was transacted before it. The acts of trade, in which the principles of the system were laid down, were passed in 1660, 1663, 1673 and 1696. They expanded and systematized the principles of mercantilism as they had long been accepted. The import and export trade of the

Colonies was required to be carried on in English and colonial built ships, manned and commanded by Englishmen. The policy of the staple was applied to the trade of the Colonies by the enumeration of their chief products which could not be raised in England and the requirement that such of these as were exported should be brought to England and pay duties there, and that the supplies not needed for the English market should be sent thence to foreign countries. The same policy was applied to all colonial imports by the requirement that they should pass through English ports. In order to prevent intercolonial traffic in enumerated commodities, which might lead to smuggling, the act of 1673 provided for the levy of an export duty on them in the Colonies in cases where a bond was not given to land them in the realm.

In the 18th century severe restrictive measures were passed to prevent the growth of manufactures in the Colonies; but these acts proved mostly a dead letter, because the Colonies had not reached the stage where such industries could be developed on any scale. Certain compensations favourable to the Colonies also appear in the system, *e.g.*, the measures to suppress the raising of tobacco in England and Ireland, in order that the colonists might have the monopoly; the payment of bounties on the importation of naval stores and on the production of indigo by the colonists; the allowance, on the re-exportation of colonial products, of drawbacks of part or all of the duties paid on importation; the admission of colonial imports at lower rates of duty than were charged on the same products from foreign countries. In order to ensure the enforcement of these acts elaborate provisions became necessary for the issue of bonds, and this, with the collection of a duty in the Colonies, led to the appointment of colonial customs officers who were immediately responsible to the commissioners of the customs and the Treasury Board in England. With them the governors were ordered to co-operate. Courts of vice admiralty, with authority to try cases without a jury, were established in the Colonies; and just before the close of the 17th century they were given jurisdiction over violations of the acts of trade, a power which they did not have in England. It thus appears that the resolve to enforce the policy set forth in the acts of trade resulted in a noteworthy extension of imperial control. How far it was successful in the immediate objects sought it is impossible to say. In some of the Colonies and at some times the acts were practically nullified. Illegal trading was always carried on, especially in time of war. But in the large it is probable that the acts were effective, and their existence always furnished a standard to which officials were required to conform.

By the Act of Union of 1707 Scotland was admitted to the advantages of the English trade system. In 1733, in order to check the development of the French colonies and prevent the importation of their products into English possessions, the Molasses Act was passed. This provided for high specific duties on rum, molasses and sugar, when imported from foreign colonies into those of Great Britain. So high were these rates that they could not be collected, and little attempt was made to enforce the act.

Returning to the 17th century, the conquest of New Netherland by the British in 1664 was an event of great importance. Taken in connection with the settlement of the Carolinas, it completed the hold which the English had upon the North American coast and gave them for the first time an extent of territory which could be profitably developed. The occupation of New Netherland was effected by a royal commission, which was also empowered to hear complaints and report a plan for the settlement of disputes in New England. A little more than ten years later a similar body, accompanied by a military force, was sent to Virginia to adjust matters at the close of Bacon's rebellion. But the commission of 1664 was the most noteworthy example of its kind. Yet, though it succeeded at New Amsterdam and in the southern Colonies of New England, it failed at Boston. Massachusetts would not admit its right to hear appeals. It did not succeed in wresting from Massachusetts the territory of New Hampshire and Maine, which the heirs of Gorges and Mason claimed.

Dominion of New England.—In 1676 Edward Randolph was sent as a special agent to Massachusetts, to require it to send agents to England. He returned to England the sworn enemy of that Colony and continued to be its tireless prosecutor. A series of negotiations ensued which lasted for almost a decade, and ended in the revocation of the Massachusetts charter by a decree in chancery, 1684. New Hampshire had already been organized as a royal province. Government under the charters of Rhode Island and Connecticut was soon after suspended. All New England was then organized as a dominion or viceroyalty under Sir Edmund Andros. Assemblies were everywhere abolished and government was left wholly in the hands of the executive. New York—also without an assembly—and New Jersey were soon after incorporated with the Dominion of New England, its boundary being extended to the Delaware river. After Bacon's rebellion in 1676 the lines of executive control were strengthened in Virginia, but the assembly continued active. These rapid changes involved the downfall of the former system of chartered colonies and the substitution of royal provinces in their place. The effect of this was to introduce into the Colonies a large number of officials of royal appointment. The entire executive and judiciary in a royal province was appointed directly or indirectly by the king. Its members held under commissions subject to the king's pleasure and were controlled by his instructions.

Colonial Reorganization.—By the abolition of assemblies and the union of Colonies on a large scale James II. did violence to the strongest feelings and traditions of the colonists. The New Englanders not only viewed the levy of taxes by prerogative with the utmost aversion, but they feared a general unsettlement of land titles, the destruction of much that was valuable in their system of town government, and the introduction of Anglican worship. They shared also in the fear, which was widespread among the colonists, that the Crown intended by an alliance with the French and Indians to force Roman Catholicism upon them. Therefore the fall of the Stuart Government in England was the signal for an uprising at Boston (April 1689) followed by a less successful one at New York. The Dominion of New England at once collapsed and the old Colony Governments were generally restored. A revolt against the Catholic proprietor in Maryland resulted in the suspension of his powers of government and the organization of Maryland as a royal province. William III. granted a new charter to Massachusetts (1691) in which full provision was made for an assembly, but also for a governor and secretary of royal appointment. Rhode Island and Connecticut were allowed to remain under their corporate charters. New York and New Hampshire were organized as royal provinces with assemblies. Proprietary government struggled back into existence in New Jersey. In Pennsylvania the governmental powers of the proprietor were suspended from 1692–94, because of his neglect of provision for defence; then they were restored and Pennsylvania continued under proprietary government until the War of Independence.

The transition from the system of chartered colonies to that of royal provinces was thus well advanced towards completion. But it was a gradual process, and the later stages of it were not reached until the second decade of the 18th century. South Carolina became provisionally a royal province in 1719, and a parallel change was completed in North Carolina a decade later. Georgia received a royal government in 1752. But in 1715 Maryland was permitted to resume its proprietary form. After the Revolution of 1689 the change to royal governments did not involve in any case the abolition of colonial assemblies. Henceforward the Crown had a fully equipped executive in every royal province. The governors exercised the royal rights of calling, proroguing and dissolving the assemblies; they assisted in initiating legislation and exercised the right of veto. All bills passed by the assemblies were required to be submitted to the King in council for acceptance or disallowance. The upper houses of the legislature were the councils of the provinces. These were small bodies and consisted, in every case except Massachusetts, of royal appointees. Their support was in most cases given to the governors, and by that means they were greatly assisted in resisting the encroachments of the lower houses of assembly which were elected by the freeholders. But, as a rule, the Crown made no provision for the salaries of its governors and other officials, and left them largely dependent for support on appropriations by the assem-

blies. Under this system of balanced forces, analogous in general to that which was reached after the Revolution in England, the Colonies entered upon the long period of the French wars.

Struggle with the French, 1690–1760.—Early French discoveries and colonization in North America were confined chiefly to the valley and gulf of the St. Lawrence. These led in the early seventeenth century to the establishment of the province of Canada. By 1610 the French had possessed themselves of the valley of the lower St. Lawrence, and the relations with the Indian tribes were being determined. During the next 50 years Canada grew slowly into an autocratically governed province, in which the Roman Catholic church was so strong as to contest supremacy at times with the civil power. The fur trade became from the first a most important industry. The Jesuits and other priestly orders undertook missionary work on a large scale among the natives. The fur trader and the missionary soon extended French influence through the region of the Great Lakes. Between the Iroquois and the French, wars were almost continuous, but with the other Indian tribes the French were in general on friendly terms. The Iroquois maintained friendly relations with the Dutch and afterwards with the English. This deeply affected relations between the English and the French, as well as the entire development of the province of New York.

French Expansion.—Exploration was a most important incident of both the fur trade and the missionary enterprises of the French. Between 1670 and 1690 their work culminated in the great exploring activity of Marquette, Joliet and La Salle. The Ohio and Mississippi rivers were discovered and their courses were mainly or wholly traced. Explorers also penetrated far into the regions beyond the Mississippi. Posts were established at various points along the Great Lakes. During the first two decades of the 18th century the French also established themselves on the Gulf of Mexico, Mobile being founded in 1702 and New Orleans in 1718. Quebec and the Gulf ports were then connected by a series of forts which, though few and weak, sufficed for communication and for the establishment of a claim to the Mississippi valley. They were Niagara and Detroit, commanding the approaches to lakes Erie and Huron; Fort Miami, on the Maumee river; Fort St. Joseph, at the southern end of Lake Michigan; Vincennes and French Fort, on the Wabash; Fort Chartres, on the Mississippi opposite St. Louis; Michillimackinac and Ste. Marie, which guarded the upper lakes. French zeal and enterprise had thus seized upon the heart of the continent. It seemed possible that English settlements might be confined to the coast, for they expanded slowly and no genius for exploration or sympathy with Indian life was shown. The tendency of British commercial policy was likewise to confine them there. The Indian alliances of the English were also far less extensive than those of the French. The provinces of South Carolina and Georgia had conflicts with the Spanish on the Florida frontier, and in these the Indian tribes of the south were also involved. But these rivalries were slight and local in character when compared with the struggle for supremacy which was preparing between the French and English.

The conflict with the French was precipitated by events in Europe. It was the English Revolution of 1689 that opened the great conflict between France and England. The question of Protestantism versus Catholicism was involved, but at bottom the struggle was one for the balance of power among European States. Rival claims, too, existed between the two powers in America, Africa and Asia. Questions of commercial and naval supremacy world-wide in extent were involved, and the colonial possessions of the two States were necessarily drawn into the struggle. In America it involved four intercolonial wars (Dutch War with France, War of Queen Anne or Spanish Succession, War of Austrian Succession and Seven Years War), which were closed respectively by the treaties of Ryswick (1697), Utrecht (1713), Aix-la-Chapelle (1748), and Paris (1763). On the American continent during the first two wars the struggle was confined to the northern frontier, and consisted of devastating raids by the French and Indians, which in turn provoked retaliatory efforts on the part of the English. These took the form in part of attacks on Acadia and of unsuccessful efforts to conquer Canada by means of joint expeditions by sea and land. The favourite land route was that from New York by way of Lake Champlain to Montreal, while the expeditions by sea were forced to make the long and perilous voyage round Nova Scotia and through the Gulf and River St. Lawrence to Quebec. In 1690 and again in 1711 an enterprise of this kind was actually undertaken. Acadia, "with its ancient limits," and the claim of France to Newfoundland and the Hudson Bay territory were, however, ceded to England by the Treaty of Utrecht.

Wars Between French and British in America.—As the great world conflict progressed the relative importance of the colonial and maritime issues which were involved increased. The first two wars had their origin primarily in European questions. The third war had its beginning in the Spanish West Indies, and clearly revealed the existence of the Bourbon Family Compact, which bound France and Spain together. On the American continent its most striking event was the capture, in 1745, of Louisburg, a stronghold which the French had recently fortified on Cape Breton. This victory was secured largely by the efforts of the New England colonists. In the following year another plan for the conquest of Canada was thwarted by the necessities of war in Europe. At the close of the war Louisburg, too, was restored to the French. After this fashion did the world struggle react upon the special interests of the English in North America, and perplex and irritate the colonists.

In the fourth intercolonial war (1754–63) the struggle between the two nationalities in North America was decided. Events which immediately preceded this war—the occupation of the Ohio valley and the building of Fort Duquesne—clearly revealed an intention on the part of the French to exclude the English from the Mississippi valley. A persistent effort was also made to recover Acadia. The western, as well as the northern, frontier was now threatened, and the war which followed affected all the Colonies. Great Britain sent over a succession of commanders-in-chief. Great improvement was made upon the crude efforts at joint colonial action which had characterized the earlier wars: the Albany congress of 1754 greatly surpassed in importance the meetings of governors and military officers which had occasionally been held in previous times, though its plan of colonial union failed. The campaigns of this war were all upon a comparatively large scale. Campaigns were carried on not merely along the line of Lake Champlain and in Acadia, but against Fort Duquesne, Oswego and Fort Frontenac, Louisburg and Quebec itself. The weak Spanish power was overthrown in Florida and expeditions were sent against the southern Indians. In all quarters, and especially after Pitt became secretary of State, the British assumed the offensive. The Navy of Great Britain, as well as its Army, was called into action on a much larger scale in America than ever before. The result was the conquest by the British of Canada, and all North America east of the Mississippi river; the French claim to territory west of this river was ceded to Spain in 1762.

The wars with the French brought the problem of colonial defence among the English into greater prominence than ever and added it to the other questions at issue. Against the Indians the colonists in the 17th century had provided for their own defence. Chiefly with this object in view, each Colony had developed a militia system. But such a force was not fitted for long campaigns or large operations: it was comparatively undisciplined; the commissariat was poor or totally lacking, and the men were able to remain away from their homes for only brief periods. The colonists possessed no navy. So poor were means of communication and so isolated were the Colonies from one another, that co-operation was very difficult. Equally difficult was it to secure proportional contributions of money from the Colonies. Early in the French wars the British Government prescribed quotas both of men and money to be raised by the Colonies, but little attention was paid to these except by the Colonies in immediate peril. Because of the limited amount of available money and the modest resources of the colonists heavy taxation was impossible. The assemblies resorted to the issue of bills of credit, to which they gave legal tender quality, and for the redemption of which in nearly all cases they made inadequate provision. The

paper depreciated and in some Colonies became worthless. Great confusion resulted, involving loss to all, and among the sufferers were British merchants. Strained relations were produced between the assemblies and the colonial executive, who, acting under royal instructions, persisted in vetoing bills for additional issues of currency. For this reason, in addition to others, the assemblies withheld the salaries of governors and other officials, and in this way sought to coerce the executives. In some Colonies the assembly secured the right of electing the treasurer, and in most of them appropriations were made specific. Thus by skilfully utilizing their control over the purse, and that during a long period of war, the colonial assemblies were able materially to limit the authority of the executives. It was in such ways as these that the Constitutions of the provinces became developed and liberalized during the French wars.

The Canadian Government.—The quality of the rank and file of the Canadian militia was not essentially different from that of the British Colonies. But the Canadian Government was autocratic. The power of the French was also concentrated in a single large province. These conditions greatly promoted military efficiency. When taken in connection with their Indian alliances, they enabled the French to take the offensive in the earlier wars much oftener than did the English, and with much greater effect. The English frontier was more accessible and more exposed than was the lower part of the valley of the St. Lawrence. Quebec was in every sense a citadel to which additional security was given during a large part of every year by the intense cold of the Canadian winter. But so superior were the training and enterprise of the French *coureur de bois* that, with his Indian allies, he was far better able than the English farmer or artisan to penetrate the wilderness, whether in winter or in summer, and massacre the exposed dwellers on the frontier. It was this class which gave the French the superiority in the long succession of raids by which the English frontier was laid waste.

Though the French by their skill and boldness achieved a remarkable success, their defects and weaknesses were equally evident. The flow of population from France to America was never great, and was diminished by the exclusion of Huguenots. The natural growth of population within New France was not rapid and the French colonists did not become sufficiently numerous to maintain the interests to which their vast claims and possessions gave rise. At the opening of the last intercolonial war the proportion of English to French colonists was approximately 15 to one. The resources of the British exceeded those of the French colonists to a corresponding degree. Had the decision of the questions at issue depended upon population and wealth alone, the issue could not long have remained doubtful. But they were so offset by other circumstances, already alluded to, that the result of the struggle was for a long time uncertain. The motherlands were to be the decisive factors in the problem, which thus depended to an extent on complications which existed in Europe or even on remoter seas and continents. When the climax of the struggle was reached the result might have been different if France at the time had not been so deeply involved in the politics of central Europe.

Of the first importance in reaching a decision were the fleets and armies of Great Britain and France, or those parts of them which were available for use on the continent of North America. During the larger part of the period under review the French neglected their fleet, while the English steadily advanced toward naval and commercial supremacy. But the first conspicuous service on the northern coasts was that which was rendered by Commodore Peter Warren and his squadron at the capture of Louisburg in 1745. In the next year a large French fleet was despatched to North America, but it accomplished nothing. In the last intercolonial war the operations before Louisburg in 1758 and at Quebec in 1759 decisively proved the superiority of the British Navy. The Colonies also, in the later stages of the struggle, contributed loyally toward the result. France failed to make her natural military superiority effective in North America, and her power on that continent had to yield before the combined attacks of Great Britain and her Colonies by land and sea.

Colonial Revolt, 1763–76.—The Treaty of Paris (1763), by which the period of colonial wars was concluded, added vast stretches of territory to the dominions of Great Britain in North America. The Floridas, Canada and Louisiana as far west as the Mississippi river now came into the possession of the English. Of the islands which were occupied, the two most important—Guadaloupe and Martinique—were restored to the French. The retention of Canada in preference to these involved an important change in the nature and objects of British colonization. Hitherto tropical colonies had been preferred to those in northern climes. But it was now bent upon continental expansion. Canada and the West were retained and the most important French islands were given back. The development of modern industry—the so-called industrial revolution had already begun in Great Britain. Its effect was vastly to increase the population of the British Isles and to necessitate an overflow into the unoccupied regions of the globe. Henceforth, as time progressed, colonies were to be valued as homes for a surplus population quite as much as sources of raw materials and food supplies. The retention of Canada and the West also coincided exactly with the desires of the continental Colonies. The chief gains of the war went therefore to them and not to the island colonies. They now possessed a continental domain which was adequate to their need for expansion, and their long-cherished desire to be rid of the French was gratified. The conquest of the French removed the sense of dependence on Great Britain for military aid previously felt by the northern Colonies in particular.

Increase of Imperial Control.—In consequence of the policy thus adopted, largely increased burdens were devolved on the Imperial Government, while the conquest and the events which led to it strengthened imperialist sentiment. The course of action which was at first favoured by leading officials, both in England and the Colonies, was a more systematic administration of Indian affairs, the employment of sufficient regular troops under the commander-in-chief to defend the newly acquired territory, the maintenance of posts with English settlers in the interior on a scale sufficient to prevent the French or Spanish from securing the trade of the region. Improved methods of administration were urged; French methods were praised and the shortcomings of the surviving chartered Colonies were again emphasized. This all required additional revenue, as well as administrative vigour, and that at a time when Great Britain was especially burdened with debt and when several of the Colonies had recently incurred heavy expenditures. The large acquisitions of territory also necessitated some changes in the acts of trade. The necessity for their more vigorous enforcement was revealed by the existence of a large contraband trade between the colonists and the enemy during the later years of the war and also of a considerable illegal trade with Europe. These conditions, together with the conviction that, as the continental Colonies had reaped the chief advantages of the war, some favour should be extended to the islands, led to the passage of the Sugar Act by the Grenville ministry in 1764. It also caused a resort to writs of assistance in two of the Colonies, and finally the legalization of them in all the Colonies by Act of Parliament (1767). The aid of the Navy was directly invoked in the enforcement of the trade laws, and the activity of the customs officials and of the admiralty courts in the Colonies was increased. Garrisons of regular troops—numbering several thousand—with a commander-in-chief were now present in the Colonies in time of peace, and their aid might possibly be invoked by the civil power to suppress disorder. The Sugar Act itself was a trade and revenue act combined, and the fact was expressed in the preamble of the measure. It was intended directly to affect the traffic between the northern Colonies and the foreign West Indies in lumber and food-stuffs, molasses and rum. The duty on foreign molasses, for which provision had been made in the Molasses Act of 1733, was halved; but now it was proposed really to collect this duty. A cry was immediately raised in New England that, if the duty was collected, the manufacture of rum—of which molasses was the staple material—would be lessened or wholly prevented and a most important industry sacrificed. The fisheries would incidentally suffer. In spite, however, of the opposition which it provoked in the northern Colonies, it is probable that the Sugar Act could have

been permanently enforced. The Act of Trade of 1673 and the Molasses Act—though it was not fully executed—were two early instances of the exercise by Parliament of the right to tax the colonies. Had the Sugar Act been enforced, a clear and decisive precedent in favour of this right would have been established. In view of the general situation, that was probably as far as the British Government should have gone at that time. But it immediately committed itself to another and still more significant measure, and the two acts combined caused an outburst of protest and resistance from the colonists.

The Stamp Act.—Repeatedly in earlier years the imposition of a stamp duty upon the Colonies had been suggested. The cost of the regular troops which must be stationed in America was estimated at about £300,000 annually. The Sugar Act was expected to yield about £45,000 a year. It was thought that the colonies should raise about £100,000 more as their reasonable share of the cost. George Grenville resolved to secure this by means of a stamp duty. This would fall upon the island colonies equally with those of the continent, though it would be expended chiefly for the enlarged military force on the mainland. Though its simplicity and ease of collection recommended it, the Stamp Act was a purely fiscal measure, and its character was not concealed by any features which allied it to the earlier acts for the regulation of trade. It was passed by Parliament in 1765, almost without debate and with scarcely a thought that it would be resisted. It provided for the appointment of officials to distribute the stamped papers in the colonies and further extended the power of the admiralty courts by giving them jurisdiction over violations of this act. The legal theory upon which the act was based was that of the unqualified sovereignty of Parliament as the representative body for the whole empire, and that its authority, if it chose to use it, was as effective for purposes of taxation as for the regulation of trade or other objects of legislation. But never before, during the century and a half of colonial history, had the taxing power been so unqualifiedly exercised. It followed close on the heels of the Sugar Act, which itself had aroused much hostile criticism. The two measures also came at a time when the consciousness of strength among the Colonists had been increased by the defeat and expulsion of the French. Moreover, at the time when the policy was initiated, George III. had undertaken to crush the Whig party and to revive the latent prerogatives of his office. This resulted in the formation of a series of coalition ministries. Vacillation and uncertainty were thus introduced into the colonial policy of the Government. The royal policy also brought into the public service in England and kept there an unusually large group of inferior men who persistently blundered in the treatment of colonial questions. It was only with the accession of the North ministry, in 1770, that permanence and a certain consistency were secured. But, in the view of the colonists, the prestige of the Government had by that time been seriously lowered.

Resistance to the Stamp Act.—Determined opposition to the Stamp Act was shown in all the Colonies, by or before the time (Nov. 1) when it was to go into effect. The forms assumed by this opposition were such as characterized the entire controversy with Great Britain until the opening of hostilities in 1775. It consisted in the passage of resolutions of protest by the lower houses of some of the colonial legislatures; in the calling of a congress at New York which was attended by delegates from nine of the Colonies; in the activity of mobs organized under the name of the "Sons of Liberty"; and, finally, in a somewhat widely extended movement against the importation of British, or even foreign, goods and in favour of frugality and the encouragement of home manufactures. The newspaper press also sprang into much greater activity than ever before, and many notable pamphlets were published. The most important resolutions at the outset were those adopted by the Virginia House of Burgesses and by the House of Representatives of Massachusetts. Through the first-named body the dramatic eloquence of Patrick Henry forced five resolutions. Two others, which threatened resistance and the coercion of any who should venture to uphold the home Government, failed to pass, but the whole seven were published broadcast through the Colonies. The calling of a general congress was proposed by the House of Representatives of Massachusetts. Prominent among its members was James Otis, who had already distinguished himself by radical opposition to measures of the Government, especially in the case against writs of assistance which was argued before the superior court in 1761. Samuel Adams, already a prominent man, was now elected a member of the House from Boston. He almost immediately became its leader, drafting its most important resolutions and papers, and to a large extent directing its policy. With the aid of others he was able greatly to increase the activity of the town-meeting in Boston, and in the course of a few years to develop it on occasion into a great popular convention. Throughout New England the town and its institutions served well the purposes of opposition and facilitated its extension over large areas. The intense Puritan spirit, with its century and a half of pronounced independence, both in polity and temper, was lacking outside New England; though on the frontiers of the provinces from Pennsylvania southward was a Scottish-Irish population which exhibited many of the New England characteristics. But the tenant farmers of New York, the German pietist sects of Pennsylvania, the Quakers wherever they had settled, and in general the adherents of the English Church were inclined toward indifference or, as the controversy progressed, toward positive loyalism. Hence the mixture of nationalities in the middle colonies greatly increased the difficulty of rousing that section to concerted action. In Pennsylvania the issues were obscured by a struggle on the part of the western counties to secure equal representation with those of the east. This helped to make loyalists of the Quakers. Special grievances also produced among the frontier settlements of North and South Carolina quite as much dislike of the officials and social leaders of the tide-water region as they could possibly feel toward Crown and Parliament. Throughout the struggle New England and Virginia exhibited a unity and decision in action which were not equalled elsewhere.

Increased Opposition.—But to return to the Stamp Act. Before the meeting of the congress at New York outbreaks of mob violence in Boston had forced the stamp distributor there to resign, and had wrecked the house of Thomas Hutchinson, the chief justice. Owing largely to the indecision of the elective council, the Government had proved powerless to check the disorder. The resolutions passed by the Congress, as well as its petitions to the home Government, gave authoritative form to the claims of the colonial opposition in general, though the body which issued them, like all the congresses which followed until 1776, was extra-legal. In these utterances, as later, the colonists sought to draw their arguments from British precedents and their own history. The two British rights which, it was claimed, were violated by the Stamp Act were the right to trial by jury and the right to be taxed only by an assembly in which they were represented. The first grievance was simply an incident of the second, and was occasioned by the extension of the jurisdiction of the admiralty courts. The tax was a direct grievance. For purposes of legislation like this these bodies denied that Parliament was representative of the whole empire. For purposes of taxation, their assemblies, they affirmed, were the only representative bodies they had known. Therefore, ignoring the earlier and tentative measures by which Parliament had actually taxed the Colonies, and falling back upon the sweeping declarations of their assemblies, they denied the right of Parliament to tax them. They declared that the recent policy of Parliament was wholly an innovation and insisted upon a return to the constitution as it was before 1763. The doctrine of natural right and compact was also resorted to with increasing emphasis in New England utterances.

Repeal of the Stamp Act.—The decisive blows, however, were struck by the mobs in the Colonies and by the Government itself in England. As the time for the execution of the Stamp Act approached, more or less violent demonstrations occurred in New York and in many other localities. The stamp distributors were forced to resign. Everywhere in the original continental Colonies the use of stamped papers was prevented, except to a slight extent in Georgia. Business requiring the use of stamps was in part suspended, but far more generally it was carried on

without their use. Without the aid of the militia, which in no case was invoked, the colonial executives proved indisposed or powerless to enforce the act and it was effectively nullified. In England the petitions of the colonists produced little effect. There the decisive events were the accession of the Rockingham ministry to power and the clamours of the merchants which were caused by the decline in American trade. The serious lack of adjustment between British politics and colonial government is illustrated by the fact that, more than three months before the Stamp Act was to go into effect, the ministry whose measure it was resigned, and a cabinet which was indifferent, if not hostile, to it was installed in office. Preparations were soon made for its repeal. The slight extent to which relations with the Colonies had been defined is indicated by the fact that the debates over the repeal contain the first serious discussion in parliament of the constitution of the British empire. While the Colonies were practically united in their views a great variety of opinions was expressed in parliament. On the question of right Lord Mansfield affirmed the absolute supremacy of parliament in dominions, while Camden and Pitt drew the same sharp line of distinction between taxation and legislation upon which the colonists insisted, and denied the right of parliament to tax the Colonies. Motives of expediency, arising both from conditions in the colonies and in England, proved decisive, and in the spring of 1766 the Stamp Act was repealed, while its repeal was accompanied with the passage of a statute (The Declaratory Act) affirming the principle that Great Britain had the right to bind the Colonies in all cases whatsoever. This measure was received with joy in the Colonies, but the prestige of the home Government had received a severe blow, and the colonists were quick to resent further alleged encroachments.

Townshend Acts.—These soon came in the form of a colonial Mutiny Act and of the so-called Townshend Acts (1767). The Mutiny Act was intended largely to meet the needs of the troops stationed in the west and in the new Colonies, but it also affected the older Colonies where garrisons of regular soldiers existed. The act provided for a parliamentary requisition for barrack supplies, and partly because it included certain articles which were not required for the soldiers in Europe, the New York legislature at first refused to make the necessary appropriation. Partly through the influence of the governor it later came to think better of it and in a non-committal way appropriated the supplies required. But meantime in England the Pitt-Grafton ministry had come into office, in which the brilliant but reckless Charles Townshend was chancellor of the exchequer. Pitt himself was disabled by illness, and the ministry, lacking his control, steadily disintegrated. Townshend availed himself of this situation to spring upon his colleagues and upon Parliament a new measure for colonial taxation, and with it a bill legalizing writs of assistance and establishing a board of commissioners of the customs in America, and a third bill suspending the functions of the assembly of New York until it should comply with the terms of the Mutiny Act. These bills all became law. Before the last-mentioned one reached the colonies, the New York Assembly had complied, and therefore the necessity for executing this Act of Parliament was avoided. The establishment of a customs board at Boston did not, of itself, provoke much criticism. But the Act of Trade and Revenue, which provided for the collection in the Colonies of duties on glass, lead, painters' colours, paper and tea, and that out of the revenue raised therefrom salaries should be paid to the governors and judges in America, opened anew the controversy over taxation.

John Dickinson, in his *Letters of a Farmer* (1767–68), denied *in toto* the authority of Parliament to tax the Colonies, and his argument was widely accepted. Massachusetts petitioned the home Government, and in a circular letter conveyed its views to the other colonies and asked an expression of theirs in return. The activity of the customs officials at Boston in seizing John Hancock's sloop, "Liberty," occasioned rioting, which in turn was followed by the transfer of two regiments to Boston. Several vessels of war were also stationed in its harbour (autumn of 1768). Deprived of their assembly, the towns of Massachusetts chose deputies, who met in convention, but without important result. Favourable replies to its circular letter were, however, received from a majority of the Colonies. Resolutions against the new act were passed by many colonial assemblies, and in several cases petitions were sent to England. The King and ministers expressed the view that the Americans were opposed to all restrictions, and that in Massachusetts treason or misprision of treason had already been committed. In this they had the support of large majorities in Parliament. The statute of 35 Henry

BY COURTESY OF THE N.Y. HISTORICAL SOCIETY

THE BOSTON "MASSACRE," MARCH 5, 1770, AFTER AN ENGRAVING ATTRIBUTED TO PAUL REVERE (1735–1818), REVOLUTIONARY PATRIOT

VIII., for the punishment in England of such offences when committed outside the realm, was now revived, and the royal officials in Massachusetts were instructed to collect evidence against suspected popular leaders with a view to their deportation across sea for trial. Though sufficient evidence was not found, nothing could have been better calculated to increase the exasperation of the colonists than a threat of this kind. It drew from the Virginia burgesses strong addresses and resolutions of protest. Fear lest the English Church would induce the Government to establish a colonial episcopate caused much discussion at this time, especially in New England, and led to plans for joint action on the part of Dissenters, in self-defence. In the course of 1769 the policy of commercial non-intercourse was again revived, and resolutions in favour of its enforcement were passed by many local bodies. But it was found difficult to enforce these, and, as the Colonies were prosperous, trade, open and illicit, with Europe continued to be large. The British merchants did not clamour for relief, as they had done at the time of the Stamp Act, but gave loyal support to the policy of the Government. The King was also steadily gaining an ascendancy, which in 1770 was permanently established by the accession of Lord North to the premiership. Thus, on both sides of the ocean, parties were bracing themselves for a struggle, the one for and the other against the principle of the Declaratory Act. The question of revenue was now largely obscured by that of right and power.

The Tea Tax.—It cannot be said that the Townshend Revenue Act was nullified, for to a certain limited extent it was executed. But in 1770, on the specious plea that the duties were uncommercial because they were levied on British manufactures, all except the duty on tea—3d. per lb.—were repealed, and a drawback of one-fourth and later of three-fifths of this duty was granted on the re-exportation of tea to the Colonies. But the preamble of the act was retained, and with it the principle of taxation. For this reason opposition continued and non-importation agreements, especially against tea, were maintained. But after the collision which occurred between the troops and the people in Boston, in

March 1770, the soldiers were removed from that town and affairs became more quiet. For more than a year it seemed as if the controversy was wearing itself out and that the old relations would be restored. But the conduct of certain naval officers and small vessels of war which had been trying to suppress illegal trade in Narragansett bay led, in June 1772, to the destruction of the schooner "Gaspee." The inquiry which necessarily followed this, together with legislation for the protection of the royal dockyards, ships and supplies, again revealed the possibility that colonists might be removed to England for trial. About the same time provision was made for the payment by the home Government of the salaries of the governors and of the judges of the superior court of Massachusetts while those officials continued to hold at the pleasure of the Crown. These events occasioned a movement in Massachusetts and Virginia which led at once to the organization of committees of correspondence, and these ultimately extended far and wide throughout the Colonies. At the same time in England the East India Company appealed to Parliament for relief from the losses caused by the transfer of the American trade so largely to the Dutch, and in response the Tea Act was passed authorizing the company to import its teas into the Colonies and providing that the English duties should be wholly drawn back on exportation, and that no compensation need be made to the Government for consequent loss of revenue. This, it was expected, would enable the company to out-compete the Dutch. But popular uprisings prevented the reception or sale of the tea at any of the ports and culminated in the destruction (Dec. 16, 1773) of 340 chests at Boston. As the King and the North ministry were now fully entrenched in power, coercion was at once resorted to and affairs were thus brought to a crisis.

The Quebec Act.—Those among the colonists who were intelligent enough to watch the course of events had long felt that they were being enveloped in a network of relations over which they had no control. This was a result of the development of the empire, with its world-wide interests. The Quebec Act, which was passed by Parliament near the close of the session of 1774, furnished a case in point. Owing to the failure of the Imperial Government to secure the revenue which it had hoped to collect under the Stamp Act and the later statutes, it had been forced to abandon its plans for the vigorous administration of Indian affairs and of the West. In view of these facts, it was thought wisest and cheapest to commit the immediate charge of the west to the province of Quebec, and therefore to extend its bounds southward to the Ohio. The Roman Catholic religion was recognized as legal within Quebec, and no provision was made for an assembly. Its extension also indicated a purpose to prevent the westward movement of population across the mountains, which was already beginning from the middle and southern Colonies.

First Continental Congress.—But the acts of the session of 1774 which were of most immediate importance were those which directly affected Massachusetts, where lay the centre of disturbance. One of these closed the port of Boston, another substituted an appointed for an elected council in Massachusetts and took the selection of jurors out of the hands of the people, and a third made possible the removal from Massachusetts of the trials of persons indicted for capital offences committed in support of the Government into neighbouring Colonies or to Great Britain, where a fair hearing was considered possible. Gen. Thomas Gage, who had been commander-in-chief in America, was now appointed governor of Massachusetts, with authority to uphold the new acts with military force. As soon as knowledge of the fate impending over Boston reached the other Colonies, conventions, local and provincial, were held, and the plan of a general congress, as proposed by Massachusetts and Virginia, was adopted. Delegates were chosen from all the Colonies except Georgia, though that province fell into line when the second Congress met. The members were instructed to the general effect that they should consult together and adopt such measures as were best calculated to secure the just rights of the colonists Voting by Colonies, but occasionally listening to utterances which implied that Americans were now thrown into a single mass, this body sent addresses to the King, to the people of the Colonies, of Quebec and of Great Britain, and prepared a declaration of rights. It is a significant fact that no address was sent to either of the Houses of Parliament. In its statement of rights the Congress (known as the First Continental Congress) limited itself to those which it believed had been infringed since 1763. These acts they described as innovations, and claimed themselves to be the true conservatives who only desired peace on the basis of the former constitution. The opposition which Massachusetts was making to the recent Acts of Parliament was approved, and the view was expressed that, if an attempt were made to execute them by force, all America should support Massachusetts. Though the work of this Congress was deliberative, it performed one positive act which contained the germ out of which new governments were to develop. That was the issue of the Association, or non-importation and non-exportation agreement, accompanied with resolutions for the encouragement of agriculture and home manufactures and for the organization of committees to carry these measures into effect. Coercion, according to the principle of the boycott, was to be applied by the Colonies and other local bodies to all who declined to accept and obey the terms of the Association. This policy had been followed at intervals since the time of the Stamp Act. It had been revived by many local and provincial bodies for the past few months. The Association became the touchstone by which loyalty to the Colonies, or to the King, was determined. Those whose loyalty to the King forbade their submission to the new regulations now felt the power of committees, even to the extent of virtual trial, imprisonment or banishment. From this action the First Continental Congress derived its chief significance.

Increase of Friction.—The Association, with its threats and dependence upon extra-legal bodies for enforcement, was a direct blow at the commercial system of the empire and could scarcely help provoking retaliation. When the Congress adjourned, some of its members predicted war. In New England the impression that war was inevitable was widespread. In Massachusetts a provincial congress was at once organized, which assumed the reins of government and began to prepare for defence. A committee of safety was chosen to carry on the work during recesses of the Congress. Thomas Gage, the governor, began fortifying Boston, while he looked about for opportunities to seize military stores which the colonists were accumulating. The raising of voluntary militia companies was soon begun in Virginia. In South Carolina, as earlier in Boston and New York, a quantity of tea was now actually destroyed, and a general committee assumed practical control of the province. From New York city and Philadelphia, as centres, the process of revolutionizing the two most conservative provinces was carried on. When Parliament met, at the close of 1774, the King and ministers declared that a most daring spirit of resistance existed in Massachusetts, which was countenanced by the other Colonies, where unlawful combinations against the trade of Great Britain were already widely extended. In these opinions the Government had the support of the majority in the two Houses, and in a joint address the rebellion in Massachusetts was declared to be a fact. As a conciliatory measure Chatham proposed that Parliament agree by resolution not to levy any tax upon the Colonies, but that the Continental Congress be required to make a free grant of a perpetual revenue which should be fully at the disposition of Parliament, the Congress fixing the quota which should be paid by each province. But the imperialist and mercantilist ideas of Chatham were expressed in the further provisions that the system of trade and navigation should not be changed and that the Army might be lawfully kept in any part of the dominions, though it should never be used to violate the just rights of the people. Edmund Burke, in his great speech on conciliation, advocated a return to the system of requisitions and did not consider a representation of the colonists in Parliament as a possibility. But these motions were rejected, and a resolution introduced by Lord North was passed. This contained no recognition of extra-legal bodies, but provided that when the assembly of any Colony should engage to support civil government within the Colony and contribute according to its ability to the common defence, the King and Parliament would then forbear to levy any more taxes on that province except what

were necessary for the regulation of trade. The Colonies, with the exception of New York, North Carolina and Georgia, were excluded from the fisheries, as a counterstroke to the Association. North's resolution proved futile, and the two parties drifted steadily toward war, though the British Government in its military estimates made no adequate provision for meeting the crisis.

Lexington and Concord.—On April 19, 1775, hostilities began in Massachusetts. A force was sent overland to Concord, 20m. from Boston, to seize or destroy the military stores which the colonists had brought together at that village. The minutemen were warned to oppose the approaching force, and at Lexington, a village situated on the road to Concord, occurred a skirmish in which the first blood of the American War of Independence was shed. The troops marched on to Concord and destroyed such of the stores as had not been removed or concealed. On their return march they were pursued by a galling fire from behind fences and buildings, and had it not been for the arrival of a relieving force the command would have been destroyed before it reached the protection of the British vessels of war at Boston. The "Lexington alarm" brought in throngs of militiamen from all parts of New England. Officers were appointed by the provincial congress of Massachusetts and by similar bodies in the other Colonies, and immediately the so-called siege of Boston began. Cannon, as well as every other form of military equipment, were now in great demand. In order to secure supplies and at the same time strike a telling blow at British authority in the north, Ticonderoga was surprised and taken on May 10. Men from Connecticut, Massachusetts, and the New Hampshire Grants (later Vermont) co-operated in this enterprise. It was soon followed by a dash into Canada, by steps which involved New York in the affair, and by the organization of a military force under Gen. Philip Schuyler for permanent service on the northern frontier. Meantime reinforcements reached Boston, led by Howe, Clinton and Burgoyne, and it was resolved to extend the British lines by occupying the heights of Dorchester on the south and those of Charlestown on the north.

Bunker Hill.—The Americans, hearing of this, seized Breed's Hill, overlooking Charlestown, where they hastily threw up a redoubt on the night of June 16. The British might easily have entrapped them, but instead on the next day the American position was assaulted on the left and carried, though with much difficulty and after a loss to the assailants of more than 1,000 men. Such was the battle of Bunker Hill, one of the most dramatic encounters in the war. In connection with all these events the Americans claimed to be acting on the defensive. But it was not difficult to perceive that, especially in New England, this claim only imperfectly concealed an intensely aggressive spirit.

Second Continental Congress.—The news of the outbreak of hostilities aroused strong feeling throughout the Colonies. The Second Continental Congress met under its influence. Its members, however, had been chosen and instructed before the clash of arms, and for that reason the course which had been worked out for them differed only slightly, if at all, from that which had been followed by their predecessors. To a certain extent the new body adhered to the former course of action. But a state of war now existed in New England and on the Canadian border. Troops were expected soon to arrive at New York. Reports of these events were thrust upon the attention of Congress at once, and the provinces involved asked for advice as to what course they should pursue. As a result of these events in the Colonies generally, the Association was being changed from a system of co-operation against British trade into a union for purposes of defence. This new situation the Congress was forced to meet. This it did largely by resolutions of advice to the Colonies, but also by positive orders. Of the former class were the resolutions about the procuring of military supplies, the assumption of powers of government by the various Colonies, and concerning defence at New York city, on the northern frontier and, later, in the highlands of the Hudson. Of a more decisive character was the appointment of officers for the army, George Washington being made commander-in-chief, the prescribing of their pay, the issue of continental bills of credit, the issue of articles of war, the regulation of trade and of Indian affairs, and the establishment of postal communication. As the revolutionary movement progressed through 1775 and the early months of 1776, executive authority in the royal and proprietary provinces collapsed. The assemblies were either dissolved or ceased to meet. The governors, their authority gone, retired on board British vessels of war, returned to England or, perchance, found themselves prisoners. This gradual fall of the old governments, imperial and colonial, was the revolution on its negative side. The rise of the system of congresses, conventions and committees, deriving their authority from the people, was the revolution on its positive side, and foreshadowed the new federal system which was rising on the ruins of the half-federated empire.

Collapse of the Royal Governments.—In Connecticut and Rhode Island the corporate system of government, which they had inherited from the 17th century, necessitated no change. The general assemblies always had been the centres of power, and the leading officials were elective for short terms and were subject to the control of the electorate. So far as the internal organization of the Colonies was concerned that was all which the revolution demanded. In the two proprietary provinces—Pennsylvania and Maryland—the executives were not so directly interested and pledged to support the Imperial Government as were those of the royal provinces. But Governor Robert Eden of Maryland was so tactful that, though the last assembly met in 1774, he was able, with the courts, to keep up some form of government there in the name of the Crown and proprietor until the early summer of 1776. In Pennsylvania the proprietors, though in sympathy with the British Government, never sought actively to influence events in their province. In the royal provinces the prorogation of the legislatures for indefinite or prolonged periods caused them early to disappear—that of Massachusetts in October, 1774. The burgesses of Virginia last met for business in May, 1774. They were prorogued to several later dates, but the governor was never again able to meet them. The long and important session of January–March, 1775, was the last ever held by the New York assembly. In April, 1775, Governor John Martin of North Carolina met the assembly for the last time, and even then the provincial convention was in session at the same time and place and the membership of the two bodies was the same. In May, 1775, disappeared the assembly of Georgia; in June those of New Hampshire and South Carolina met for the last time. Governor William Franklin was able to meet the assembly of New Jersey as late as November, but months before that date the provincial convention had practically assumed the control of affairs.

Washington in Command.—After Bunker Hill the command at Boston had been transferred from Gage to Sir William Howe. In July, Washington took command of the colonists and gradually established some degree of order and discipline among them. Though the American levies were raw and ever fluctuating in numbers, the British never seriously attempted to break through their lines. Indeed, it was not the plan of the British to make New England the chief seat of war. As early as Aug. 2, 1775, Lord Dartmouth wrote to General Gage on "the obvious advantages that would attend the taking Possession of New York and the hazard of the Army's continuing at Boston." Rhode Island was considered as a convenient naval station, and steps were soon taken to secure possession of it and its surrounding waters. The British wished to so plan the war as to secure the maximum of advantage from their fleet. This would give them an easy command of the entire coast, and enable them to secure a foothold at strategic centres. Hence it was that, though the arrival of a fresh supply of cannon enabled Washington to fortify Dorchester Heights, this simply enabled him to hasten a process for which Howe had long been preparing. The evacuation occurred on March 17, 1776, and the British force withdrew temporarily to Halifax. Meantime the bold expeditions of Arnold and Montgomery against Canada had met with only a partial success. Montreal had been occupied, but the asault upon Quebec had failed.

The view, as it was now repeatedly expressed by King and Parliament, was that the colonists were in open rebellion. North's offer of conciliation was peremptorily rejected by Congress. The acts of Parliament were being openly resisted, and Congress in its

manifestos had ignored the two houses. Therefore the British Government stood committed to coercion. That was the meaning of the legislation of the winter of 1776—the prohibition of trade with the rebellious Colonies, the increase of the estimates for the Army and Navy, the employment of German auxiliaries for service in America. Preparations were made to send a large military and naval force the following season, which should operate in part against the insurgents in New York and the southern Colonies and in part through Canada. New England was no longer to be the direct object of attack. The Howes, as commanders of the royal Army and Navy, were appointed commissioners to grant assurance of peace and pardon and the repeal of the obnoxious acts, provided submission was made and some way could be found by Parliament in which an imperial revenue for purposes of defence could be secured from the Colonies. Military operations, meanwhile, should be directed against points of least resistance, and in that way, if possible, the union of the Colonies should be broken. The trend of British policy indicated that an invasion from Canada might be attempted and an effort made to hold Charleston, Philadelphia, and especially New York as strategic points on the coast.

The course of events in the Colonies by which this situation was met was the erection of a system of feeble defences about New York and the removal thither of the Army of about 9,000 men in the spring of 1776; the fitting out of privateers to prey on British commerce; the disarming of loyalists; the opening of American ports to the trade of all peoples who were not subject to the British Crown; and the tentative opening of relations with France. As the result of a combination of ill luck, bad management and American energy the British suffered a repulse at Charleston, South Carolina, in June, which was analogous to the affair of the year before at Bunker Hill, and which necessitated a postponement of their plans in the south.

The Congress and the various revolutionary bodies in the Colonies were forced to carry on war upon a constantly increasing scale. They had to assume powers of government and gradually to perfect their organization for the purpose. Committees in Congress became more permanent. Conditions approximating to those which existed the year before in New England extended through the Colonies generally.

The Declaration of Independence.—On May 15, 1776, as the result of various earlier applications and especially of one from certain Whigs in New York, the Congress recommended to the assemblies and conventions of the Colonies where no Government sufficient to the exigencies of their affairs had been established, "to adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness of their constituents in particular and of America in general." The preamble to this resolution set forth as facts the statements that the Colonies had been excluded from the protection of the Crown, that no answer had been given to their petitions for redress, and that the whole force of the kingdom was to be used for their destruction, and therefore that it was no longer reasonable or honest for the colonists to take the oaths or affirmations necessary for the support of Government under the Crown. Though the preamble was warmly debated, it was adopted. And this act marked a turning-point, for the progress of events from that time to the Declaration of Independence was rapid and decisive. The Colonies—now becoming States—one after another, in response to letters from Philadelphia, empowered their delegates to concur in declaring independence. On June 7, R. H. Lee of Virginia introduced in Congress a resolution "that these United Colonies are and of right ought to be free and independent states," that it was expedient forthwith to take effectual measures for securing foreign allies, and that a plan of confederation should be formed. The debate showed that the delegates from the middle colonies and South Carolina could not act, and the decision was postponed for three weeks. In the interval steps were taken to draft a plan of treaties and articles of confederation. A board of war and ordnance, the earliest germ of an executive department, was also created by Congress.

At the end of the three weeks the delegates from all the Colonies except Georgia, South Carolina and New York had received instructions favourable to independence. The two former left their delegates free, and under the influence of the British attack on Charlestown they voted for independence. News had just come that Howe had landed with a large force at Sandy Hook. Under the impression of these stirring events the Declaration, substantially in the form given to it by Thomas Jefferson, was agreed to (July 4, 1776), only three adverse votes being cast. The delegates from New York took no part, but a few days later the act was approved by the convention of that State. The signing of the document by

HOME OF BETSY ROSS, LEGENDARY MAKER OF FIRST AMERICAN FLAG
The little house on Arch Street, Philadelphia, where Mrs. Ross lived at the time she is said to have made the first American flag (1777), was converted into public property by the Betsy Ross Memorial Association in 1905 and has since been known as the American Flag House

the members took place at a later time. Thus triumphed the tendencies toward self-government which had been predominant in the continental Colonies from the first, and which the system of imperial control had only superficially modified and restrained. But the most significant part of the document for the future was the preamble, in which the democratic aspirations of the new nation were set forth, the spirit to which Thomas Paine had just made so powerful an appeal in his *Common Sense*. Governments, it was said, derive their just powers from the consent of the governed, and when any system becomes destructive of these ends it is the right of the people to abolish it and to institute a new Government, establishing it upon such principles and under such forms as seem most likely to effect their safety and happiness. (*See* DECLARATION OF INDEPENDENCE.)

Weakness of the General Government.—Viewed from one standpoint, the Declaration of Independence was apparently an act of the utmost recklessness. The people were by no means a unit in its support, and in several of the States widespread indifference to it, or active sympathy with the British, prevailed. The United States, as yet, had no international status, and it would seem that that must be secured, if at all, by a series of victories which would ensure independence. But how could these be won against the greatest naval power on the globe, supported

by veteran armies of continental and British troops? The Colonies had no money; the few vessels which, as a collective body, they did send out, were more like privateers than anything else. Their Army was an undisciplined throng of militiamen, serving on short enlistments, without organized commissariat, and for the most part under inexperienced officers. Its numbers, too, were far inferior to those of the British. Taxation by the Continental Congress for the support of the war was not among the possibilities of the case. A strong tendency toward the provision for immediate needs by the issue of bills of credit had been inherited from the period of the French wars, and that device was again resorted to. The battle of Bunker Hill had been immediately followed by an order of Congress for the issue of $2,000,000 in that form of currency. Issues followed in rapidly increasing amounts, until by the close of 1779 $241,000,000 had been authorized. The States put out nearly as much ($209,000,000). The continental paper money depreciated until it became worthless, as to a large extent did that of the States also. The States decreed it to be legal tender, and dire threats were uttered against those who refused to receive the bills; but all to no purpose. The Congress also tried to induce the States to tax themselves for the general cause and was forced to rely on requisitions for the purpose. These measures proved as complete a failure as when resorted to by the Crown. The revolution was therefore never financed. It early became necessary to resort to loans and that chiefly from foreign sources. It was therefore an absolute necessity that the Colonies should secure international recognition and status. Then loans were obtained from the Government of France and Spain and from private bankers in Holland to the amount of about $7,830,000.

The collapse of royal Government left the Colonies in a chaotic state. The old institutions had disappeared and new ones could not be immediately developed to take their place. But the institutions of local Government, the town and county systems, were left intact, and upon these as a basis the new fabrics were erected. It was therefore easier to construct the Governments of the States than to define and develop the general Government. At first little else was intended than that the Congress should be the mouthpiece of the patriot party. It proceeded mainly by way of recommendation, and looked to the States, rather than to itself, as the ultimate sources of authority. Upon them it depended for the execution of its measures. As the war proceeded the States grew jealous of the central body and tried to prevent appeals to it from the State courts in prize cases. Under the pressure of war, moreover, the enthusiasm, which had been strong at the outset, declined, and it became increasingly difficult to secure co-operation or sacrifice toward any general enterprise.

Difficulty of Congress.—At the same time, war devolved upon Congress an enormous burden of work. It was forced to devise general policies and provide for their execution, and also to attend to an infinite number of administrative details. Most of the able members were drawn off into the Army, into diplomatic service or official service in the States. Sectional and State jealousies also developed and became intense. As the Congress voted by States the smaller commonwealths were often moved by jealousy of their larger rivals to thwart important measures. But, above all, the conduct of the war and foreign relations occasioned infinite jealousies and cabals, while many of the most important measures seemed to meet with downright indifference. Washington's correspondence abounds in evidence of these facts, while it is well known that he was the object against whom one of the cabals of the time was directed. Benjamin Franklin was the object of somewhat similar jealousies. But, as time passed, rudimentary executive departments, beginning with the board of war and the postmaster general, were developed, and some advance was made toward a working and permanent system. In 1781 the offices of foreign secretary, superintendent of finance, secretary of war and secretary of marine were created.

Military Disasters.—Until almost its very close the campaign of 1776 was a disheartening failure. The battle of Long Island was lost by the Americans and, as at Bunker Hill, it would have been quite possible for the British to have captured the entire force which opposed them on Long Island. Howe compelled Washington to evacuate New York city. On Nov. 16 the practical abandonment of the State of New York by the main army was necessitated by the capture of Ft. Washington. Earlier in the year the Americans had been compelled to retire from Canada, while the Tories in northern New York were contributing valuable aid to the British.

The Tide Turns.—But there was another side to the picture, and already certain faint outlines of it were being discerned. The British commander was, at practically every step failing to seize the advantages that were within his reach, while Washington was learning to play a losing game with consummate patience and tact. After Washington had crossed the Delaware, Howe, instead of seizing Philadelphia and driving Congress and the American Army to some remote places of refuge, as he might have done, prepared for winter quarters. Washington seized the opportunity to return across the Delaware and surprise the British outposts at Trenton (Dec. 26, 1776) and Princeton (Jan. 3, 1777), and thus secured a safe post of observation for the winter at Morristown. Confidence was to an extent restored, the larger part of New Jersey was regained, and many loyalists were compelled to take the oath of allegiance. Howe's plan for the next campaign involved the strengthening of his army by large reinforcements. With this force he proposed to capture Philadelphia and thereby to bring the War of Independence to an end in Pennsylvania, New Jersey and New York. New England and the states farther south could then be dealt with in detail. But Howe was overruled by Lord George Germain, the colonial secretary, whose plan included an invasion from Canada, in which Tories and Indians should share, while Howe should advance up the Hudson and meet the northern forces at Albany. If this ambitious scheme should succeed, the British would occupy the valley of the Hudson and New England would be cut off from the rest of the colonies. Gen. Burgoyne was appointed to command the northern expedition. But the failure of the plan was almost ensured from the outset by the neglect on the part of British officials to instruct Gen. Howe as to his part in its execution. Burgoyne was forced to surrender near Saratoga on Oct. 17. Meanwhile, Howe, who had long waited for instructions respecting the northern expedition, was finally informed that he might undertake the Pennsylvania campaign, but with the hope that at its close he would still be able to march up the Hudson. Thereupon, embarking his army, Howe sailed for Chesapeake Bay, at the head of which he landed and advanced towards Philadelphia. Washington's army opposed his march at the Brandywine (Chad's Ford), but was defeated (Sept. 11, 1777) and forced to retire beyond Philadelphia. The British then entered the city (Sept. 26) and the Congress withdrew to Lancaster, and later to York, in the interior of Pennsylvania. The British fleet had in the meantime arrived in Delaware Bay, and, after a prolonged and brave defence, had captured Forts Mercer and Mifflin. When winter began the Delaware, as well as lower New York and Rhode Island, was in the possession of the British. With the fragments of an army Washington retired to Valley Forge.

French Alliance.—But the influence of Burgoyne's surrender in Europe was to prove a turning-point in the war. Since 1763 a strong sentiment at the French court had been favourable to a resumption of war with Great Britain. An opportunity was now presented by the colonial revolt. In February 1776 Silas Deane was sent to Paris, ostensibly as a business agent, and with the connivance of the French Government supplies were sent to America and American vessels were received into French ports. Soon American privateers were bringing their prizes into French harbours, and British commerce began to suffer from these attacks. On the French side Beaumarchais and others actively co-operated in this. In the autumn of 1776 Congress appointed three commissioners to France, and resolved that Spain, Prussia, Austria and other European States should be approached with a view to securing recognition and aid. In December 1776 Franklin, who, with Deane and Arthur Lee, had been appointed commissioner to France, arrived at Paris, bringing with him proposals for treaties of commerce and alliance. But, though the attitude of the French court toward the Americans was friendly,

and though it continued to send secret aid, and to exert a favourable influence upon Spain, yet it could not be induced to abandon its outward appearance of neutrality until after the news of Burgoyne's surrender arrived. Then the real purpose of the French Government was revealed. On Feb. 6, 1778, the treaties were signed, and in the following summer war between France and England began. The influence of France under the Family Compact, brought Spain into the alliance in April 1779. In October 1779 Henry Laurens was elected minister to the Netherlands, and sailed for Europe, taking with him a plan of a commercial treaty. But Laurens and his papers were captured by the British at sea, and partly by that event the Netherlands were forced into war with England. With the other States of northern Europe they undertook to defend the interests of neutrals against the arrogant enforcement by Great Britain of the rights of search at sea. Thus the conflict expanded into a commercial and naval war, Great Britain being confronted by the larger part of Europe.

Philadelphia Recaptured.—The conclusion of the treaty of alliance by France was immediately followed by the equipment of a fleet under the comte d'Estaing, which sailed from Toulon in April 1778. Sir Henry Clinton had now succeeded Howe in command of the British army. The certainty that a French fleet would soon appear in American waters made it necessary for the British to evacuate Philadelphia and return to a point on the coast where the army could be in easy communication with the fleet. This fact shows how the French alliance had changed the nature of the war. It now became to a large extent a contest between the two navies, the principal evolutions of which occurred in West Indian and European seas. In the north the British now relatively neglected the land war, and refrained from sending such forces to the eastern coast as had supported Howe in 1776. The Americans, on the other hand, had a naval force upon which they relied, in the hope that the blockade of their coasts might be raised and trade routes opened more freely. On the evacuation of Philadelphia in June Washington's army pursued the British as they retired toward New York, and the indecisive battle of Monmouth was fought on June 28. It did not prevent Clinton from reaching New York, and that city continued to be the centre of British power and operations in the north until the close of the war. The Congress returned to Philadelphia. Washington's army came gradually to occupy a line of forts, of which West Point in the highlands of the Hudson was the citadel. From there as a centre it was possible to communicate with Newport on the east and with the Delaware region on the south, and at the same time to prevent the British from gaining access to the interior of the country. Though the fleet of D'Estaing carried a heavier equipment of cannon than did that of Admiral Howe, the French commander did not choose to risk an attack on New York, but passed eastward to Newport. Howe followed him, while Washington and his generals planned active co-operation with the new allies by land. But a sudden storm so dispersed and injured the fleets that the French admiral retired to Boston for repairs and later sailed for the West Indies.

State Constitutions.—While the war and foreign relations were thus developing, the States were organizing their governments and Congress was beginning to consider articles of confederation between the States. In this way an effort was made to gather up and make permanent the positive results of the revolution. As under the chartered and royal governments of the colonial period the source of political authority had been the Crown, now by a necessary reaction this was sought in the people. This principle had been stated in the Declaration of Independence, and had been implied throughout the earlier controversy. The Colonies had insisted on a more precise definition of the powers of government; they had opposed Parliament because its powers were undefined and therefore dangerous. Following these ideas, the States now described their institutions of government and defined their powers by means of written constitutions. These were formulated by the provincial congresses—which had now become the legislatures—or, as they came to insist upon a more specific expression of the popular will, by conventions chosen for the purpose by the electors. Connecticut and Rhode Island retained their colonial charters. In the earlier days of hasty and temporary devices, the constitutions, like statutes, had been promulgated by the legislatures which formed them and had been put into force by their authority alone. But as time passed and more permanent arrangements became necessary an express popular approval of the instruments was obtained before they were put into force. The establishment of State governments in this way began before the issue of the Declaration of Independence. It was actively continued during 1776 and the early months of the following year, by which time all of the States had secured at least a temporary constitution. Of the constitutions of the revolutionary period the two most striking features were the bills of rights and the provisions which were made concerning the executives and their relations to the legislatures. The men of that generation were jealous of government. They insisted upon individual rights, not as acquired and guaranteed by the State, but as original, natural and inhering in time prior to all governments. Governments were instituted for the common benefit, protection and security. Officials were trustees and were accountable to the people. There should be no hereditary title to office or power. There should be no titles of nobility, and in Virginia the system of entails was swept away. Monopolies were declared to be inconsistent with the spirit of a free State. Freedom of the press and of conscience was asserted, and no obstacles to fair and speedy jury trials were to be tolerated. Elections should be free and frequent, and a preference was expressed for short terms of office. The legislature was universally regarded as the most important department of government. Although the principle of the separation of powers was recognized, in eight States provision was made that the executives should be elected by the legislatures, 11 withheld from them the veto, and the States generally provided for a council to advise them. So manifold and important, however, were the restrictions on suffrage that the States were as yet far from being democracies.

The Articles of Confederation.—The first draft of the Articles of Confederation between the States was prepared by John Dickinson in the early summer of 1776 and was reported. Owing to the pressure of war it was then laid aside until the autumn of 1777. By that time the feeling in favour of State sovereignty had so increased that the impossibility of securing assent to the articles in any form had begun to be feared. But the document was completed and submitted to the States in November 1777, when all were encouraged by the news of Burgoyne's surrender. The system for which provision was made in this document was a "confederacy," or "firm league of friendship" between the States. The Congress was to be continued, and was to consist of delegates annually appointed by the legislature of each State and paid by their States. No attempt was made to create an executive for the confederacy, though authority was given to Congress to appoint a council of State which should manage general affairs, especially during recesses of Congress. To Congress various general powers were entrusted, as deciding on peace and war and superintending the conduct of the same, building a navy, controlling diplomatic relations, coining money and emitting bills of credit, establishing post offices, regulating Indian trade, adjusting boundary disputes between the States. The financial powers entrusted to Congress included those of borrowing money and determining necessary expenditures, but not the power to tax. For supplies the general government had to depend on requisitions from the States. The same system also had to suffice for the raising and equipment of troops. Congress could not make its laws or orders effective in any matter of importance. This was simply a continuation of the policy under which the revolution was being conducted. The control of trade was practically left with the States, the Americans in this matter failing to live up to the requirements of the British system. The predominance of the States was further ensured by the provision that no votes, except those for daily adjournment, could be carried without the assent of a majority of all the States, and no important measure without the consent of nine States. But a common citizenship was declared to exist, and Congress received authority to establish a court of appeal which might pass finally

on all disputes between States. Taken as a whole, the Articles of Confederation would bear favourable comparison with other schemes of their kind, and they fairly represented the stage of development to which the American States had then attained.

The West.—We have seen that, on the whole, the attitude of Great Britain, after the peace of 1763, was not favourable to the colonization of the Mississippi valley. To the colonists the Quebec Act gained in offensiveness by seeming to imply that it was intended to exclude them from the West. But all such plans were swept away by the outbreak of the War of Independence. Already, before the beginning of hostilities, emigrants had begun to flock across the mountains. Plans were on foot for the establishment of a number of commonwealths, or proprietary provinces, as the case might be. Daniel Boone and his associates pushed farther west into the Kentucky region, and there it was proposed to establish the commonwealth of Transylvania. Other similar projects were started, all repeating in one form or another the political methods which were used when the seaboard colonies were first settled. The backwoodsmen who managed these enterprises were extreme individualists, believed in the propriety of resistance to governments, and were in full sympathy with the War of Independence. The States which had claims in the West opposed the founding of independent settlements there and, if possible, induced the settlers to be content with the status of counties within some one of the eastern States. After the beginning of the War of Independence, the British from Detroit incited Indian raids for the purpose of destroying or driving out the settlers, especially in Kentucky. These provoked the important expeditions of George Rogers Clark in 1778 and 1779. With a force of Virginians he seized Kaskaskia and later, after a long march, captured Vincennes and compelled General Henry Hamilton, who had come with a relief force from Detroit, to surrender. This secured to the Americans a permanent hold upon the north-west. But Spain, after she entered upon the war, was determined, if possible, to wrest the valley of the Mississippi from the British and to keep all, or the larger part of it, for herself. To that end, operating from New Orleans, her troops took possession of Natchez, and other posts on the lower Mississippi, and occupied Mobile and Pensacola.

Articles of Confederation Ratified.—Within the Confederacy a fundamental line of cleavage was that between the large and small States. It was jealousy on the part of the small ones, their fear lest they might be absorbed by their larger neighbours, which had necessitated the adoption of the plan that in the Congress the delegates should vote by States. When the articles were referred to the States for ratification, the difficulty reappeared. Massachusetts, Connecticut and New York, with Virginia and the three States to the south of it, had large claims to territory between the Appalachians and the Mississippi. New Hampshire, Rhode Island, New Jersey, Delaware and Maryland, which were without hope of westward extension, hesitated to enter the Confederacy, if the large States were to be still further increased by additions to their areas of vast stretches of western country. They insisted that before ratification the States which had claims to western lands should surrender these for the common benefit of the United States. Maryland insisted upon this until, in the end, the cause of State equality and of nationality triumphed. Congress declared that the ceded lands should be formed into States, which should become members of the union with the same rights as other States. When in 1781 the course of action had become possible, Maryland ratified the articles and they came into effect.

War in the South.—So far as the north American continent was concerned, the character of the last stage of the struggle with Great Britain was determined by the fact that the British resolved to transfer the main seat of war to the southern States, in the hope that Georgia and South Carolina might be detached from the union. At the close of 1778 Savannah was captured. In September 1779 D'Estaing returned and assaulted Savannah, but, failing to capture it, sailed for France. In 1780 Clinton sailed from New York, besieged Charleston with a force much superior to that of Lincoln, and captured it (May 12). State government in South Carolina ceased. But the chance of detaching those States from the union and of bringing the war in that region to an end was finally lost by the British. This was chiefly due to an order which recalled the paroles of many of those who had surrendered at Charleston and required that they should perform military service under the British. The attempt to enforce this order, with the barbarities of Colonel Banastre Tarleton and certain Tory bands, provoked a bloody partisan conflict in the upper districts, especially of South Carolina, which contributed more than any other cause to run the scale against the British in the remote south. By the winter of 1781 they were forced back to Charleston and Savannah.

Yorktown.—During the summer of 1780, Washington was prevented from accomplishing anything in the north by the demoralized condition of the finances and by the decline of public spirit. It was very difficult to secure recruits or supplies. The pay of the troops had fallen so into arrears that some of them had already begun to mutiny. A second French squadron and military force, under De Ternay and Rochambeau, landed at Newport, but they were at once shut up there by the British. Clinton and Cornwallis were now planning that Cornwallis, having put down resistance in the remote south, should march through North Carolina and Virginia to Baltimore and Philadelphia and that a junction of the two British forces should be effected which, it was believed, would complete the ruin of the American cause. But the turn of the tide in favour of the Americans began with the partisan warfare in South Carolina, which delayed the northward march of Cornwallis, who retired to Wilmington and thence marched north with a small force into Virginia, and in July retired to Yorktown, in the peninsula of Virginia. Washington and Rochambeau had meantime been planning a joint move against the British at New York, or possibly in Virginia, and a letter was sent to De Grasse, the French admiral in the West Indies, suggesting his co-operation. De Grasse replied that he would sail for the Chesapeake. This confirmed Washington and Rochambeau in the opinion that they should march at once for Virginia and, after junction with the force of Lafayette, co-operate with De Grasse against Cornwallis. By well-timed movements the forces were brought together before Yorktown and Cornwallis was forced to surrender on Oct. 19, 1781.

Treaty of Peace.—This proved to be the last important operation of the war in America. The King was compelled to give way. Rockingham was called into office at the head of a cabinet which considered the recognition of American independence to be indispensable. The negotiations fell into the hands of Shelburne, the friend of Franklin and disciple of Adam Smith. Richard Oswald was the leading British agent, while Franklin, Jay, John Adams and Henry Laurens were the American negotiators. From the first the acknowledgment of independence, the settlement of the boundaries and the freedom of fishing were insisted on as necessary terms by the Americans. The three points were early conceded by the British. They also agreed to restrict Canada to its ancient limits. But discussions later arose over the right to dry fish on the British coasts, over the payment of debts due to British subjects prior to the war and over the compensation of the loyalists. Adams vigorously insisted upon the right to dry and cure fish on British coasts, and finally this concession was secured. Franklin was opposed to the demands of the loyalists, and they had to be content with a futile recommendation by Congress to the States that their claims should be adjusted. It was also agreed that creditors on either side should meet with no lawful impediment to the collection of their debts. Both France and Spain considered the claims of the Americans to be excessive, and were not inclined to yield to them. But the Americans negotiated directly with the British and the articles were signed without consultation with the French government. Peace was formally ratified on Sept. 3, 1783.

The American army was now disbanded. Since the close of active military operations both officers and men had been striving to secure their pay, which was hopelessly in arrears. Congress had voted half-pay to the officers for life, and many had agreed to accept a commutation of this in the form of full pay for a certain number of years. Certificates for these amounts were issued. But

in this, as in other cases, it was found impossible to procure the money for the purpose from the States. Parts of the army repeatedly mutinied, and it was only the influence of Washington which prevented a general outbreak. When the disbandment was finally effected the officers found their certificates depreciated and the states indisposed to honour them. They received only a small part of their due, and the privates scarcely anything. (H. L. O.)

STRUGGLE FOR NATIONAL GOVERNMENT, 1783–1865

The long struggle to secure the ratification of the Articles of Confederation had given time for careful consideration of the new scheme of government. Maryland's persistent criticism had prepared men to find defects in them. Conventions of New England States, pamphlets, and private correspondence had found flaws in the new plan; but a public trial of it was a necessary preliminary to getting rid of it. The efforts of the individual States to maintain the war, the disposition of each State to magnify its own share in the result, the popular jealousy of a superior power, transferred now from parliament to the central government, were enough to ensure the articles some lease of life.

Territorial Cessions.—Congress and its committees had already begun to declare that it was impossible to carry on a government efficiently under the articles. Its expostulations were to be continued for several years before they were heard. In the meantime it did not neglect the great subject which concerned the essence of nationality—the western territory. Virginia had made a first offer to cede her claims, but it was not accepted. A committee of Congress now made a report (1782) maintaining the validity of the rights which New York had transferred to Congress; and in the next year Virginia made an acceptable offer. Her deed was accepted (March 1, 1784); the other claimant States followed; and Congress, which was not authorized by the articles to hold or govern territory, became the sovereign of a tract of some 430,000 square miles.

In this territory Congress had now on its hands the same question of colonial government in which the British Parliament had so signally failed. The manner in which Congress dealt with it has made the United States the country that it is. The leading feature of its plan was the erection, as rapidly as possible, of States, similar in powers to the original States. The power of Congress over the territories was to be theoretically absolute, but it was to be exerted in encouraging the development of thorough self-government, and in granting it as fast as the settlers should become capable of exercising it. Copied in succeeding acts for the organization of territories, and still controlling the spirit of such acts, the ordinance of 1787 (July 13, 1787) is the foundation of almost everything which makes the American system peculiar.

Difficulties of the Confederation.—In the interval of the settlement of the territorial question the affairs of the "league of friendship," known as the United States, had been going from bad to worse, reaching a crisis in 1786. The public debt amounted in 1783 to about $42,000,000, of which $8,000,000 was owed abroad—in Holland, France and Spain. Congress had no power to levy taxes for the payment of interest or principal; it could only make requisitions on the States. In the four years ending in 1786 requisitions had been made for $10,000,000 and the receipts from them had amounted to but one-fourth of what had been called for. Even the interest on the debt was falling into arrears, and the first instalment of the principal fell due in 1787. To pay this, and subsequent annual instalments of $1,000,000, was quite impossible. Robert Morris, the financier of the War of Independence, resigned in 1783 rather than "be the minister of injustice," hoping thus to force upon the States the necessity of granting taxing powers to Congress. Washington, on retiring from the command-in-chief, wrote a circular letter to the governors of all the States, urging the necessity of granting to Congress some power to provide a national revenue. Congress (April 18, 1783) appealed to the States for power to levy specific duties on cer-

tain enumerated articles, and 5% on others. It was believed that with these duties and the requisitions, which were now to be met by internal taxation, $2,500,000 per annum could be raised. The proposal never received the necessary ratification of all the States. The obedience to the requisitions grew more lax. In 1786 a committee of Congress reported that any further reliance on requisitions would be "dishonourable to the understandings of those who entertain such confidence."

The States and Congress.—In the States the case was even worse. Some of them had been seduced into issuing paper currency in such profusion that they were almost bankrupt. Great Britain, in the treaty of peace, had recognized the independence of the individual States, naming them in order; and her Government followed the same system in all its intercourse with its late Colonies. Its restrictive system was maintained, and the States, competing with each other for more commerce, could adopt no system of counteracting measures. Every possible burden was thus shifted to American commerce; and Congress could do nothing, for, though it asked for the power to regulate commerce for 15 years, the States refused it. Several States, towards the end of this period, began to prepare or adopt systems of protection of domestic productions or manufactures, aimed at preventing competition by neighbouring States. The Tennessee settlers were in insurrection against the authority of North Carolina; the Kentucky settlers were disposed to cut loose from Virginia. Poverty, with the rigid execution of process for debt, drove the farmers of western Massachusetts into an insurrection (Shays's Insurrection) which the State had much difficulty in suppressing; and Congress was so incompetent to aid Massachusetts that it was driven to the expedient of imagining an Indian war in that direction, in order to transfer troops thither. Congress itself was in danger of disappearance from the scene. The necessity for the votes of nine of the 13 States for the passage of important measures made the absence of a State's delegation quite as effective as a negative vote. Congress even had to make repeated appeals to obtain a quorum for the ratification of the treaty of peace with Great Britain. In 1784 Congress broke up in disgust, and the French minister reported to his government—"There is now in America no general government—neither Congress, nor president, nor head of any one administrative department."

Congress was evidently incompetent to frame a new plan of national government; its members were too dependent on their States, and would be recalled if they took part in framing anything stronger than the articles. The idea of a convention of the States, independent of Congress, was in the minds and mouths of many; Thomas Paine had suggested it as long ago as his *Common Sense* pamphlet: "Let a continental conference be held . . . to frame a continental charter."

Convention of 1786.—The country drifted into a convention by a roundabout way. The navigation of Chesapeake Bay and the Potomac needed regulation; and the states of Maryland and Virginia, having plenary power in the matter, appointed delegates to arrange such rules. The delegates met (1785) at Alexandria (Va.), and at Washington's house, Mount Vernon (Va.), in adopting their report, proposed that Pennsylvania and Delaware be asked to nominate commissioners. Virginia went further and proposed a meeting of commissioners from all the States to frame commercial regulations for the whole. The convention met (1786) at Annapolis (Md.), but only five States were represented, and their delegates adjourned, after recommending another convention at Philadelphia in May 1787.

Constitutional Convention.—Congress had failed in its last resort—a proposal that the States should grant it the impost power alone; New York's veto had put an end to this last hope. Confessing its helplessness, Congress approved the call for a second convention; 12 of the States (all but Rhode Island) chose delegates; and the convention met at Philadelphia (May 25, 1787) with an abler body of men than had been seen in Congress since the first two Continental Congresses. Among others, Virginia sent Washington, James Madison, Edmund Randolph, George Mason and George Wythe; Pennsylvania: Franklin, Robert, Gouverneur Morris and James Wilson; Massachusetts: Rufus King, Elbridge Gerry and Caleb Strong; Connecticut: William S. Johnson, Roger Sherman and Oliver Ellsworth; New York: Alexander Hamilton; New Jersey: William Paterson; and South Carolina the two Pinckneys and John Rutledge. With hardly an exception the 55 delegates were clear-headed, moderate men, with positive views of their own and firm purpose, but with a willingness to compromise.

The Virginia Plan.—Washington was chosen to preside, and the convention began the formation of a new Constitution, instead of proposing changes in the old one. Two parties were formed at once. The Virginia delegates offered a plan proposing a Congress, of two houses, having power to legislate on national subjects, and to compel the States to fulfil their obligations. This was a "large-State" plan, proposed by those States which had or hoped for a large population. It meant to base representation in both houses on population, so that the large States could control both of them, and it left the appointment of the president or other executive and the Federal judges to Congress—so that the whole administration of the new government would fall under large-State control.

The New Jersey Plan.—On behalf of the "small States" Paterson of New Jersey brought in another plan. It continued the old Confederation, with its single house and equal State vote, but added the power to regulate commerce and raise a revenue, and to compel the States to obey requisitions. The large States had a general majority of six to five, but the constant dropping off of one or more votes, on minor features, from their side to that of the small States prevented the hasty adoption of any radical measures. Nevertheless, the final collision could not be evaded; the basis of the two plans was in the question of one or two houses, of equal or proportionate State votes, of large-State supremacy or of State equality. In July the large States began to show a disposition to force their plan through, and the small States began to threaten a concerted withdrawal from the convention.

The Compromise.—The Connecticut delegates, from their first appearance in the convention, had favoured a compromise. They had been trained under the New England system, in which the assemblies were made up of two houses, one representing the people of the whole State, according to population, and the other giving an equal representation to the towns. They proposed that the new Congress should be made up of two houses, one representing the States in proportion to their population, the other giving an equal vote to each State. At a deadlock the convention referred the proposition to a committee, and it reported in favour of the Connecticut compromise. Connecticut had been voting in the large-State list, and the votes of her delegates could not be spared from their slender majority; now another of the large States, North Carolina, came over to Connecticut's proposal, and it was adopted. Thus the first great struggle of the convention resulted in a compromise, which took shape in an important feature of the Constitution, the Senate.

The small States were still anxious, in every new question, to throw as much power as possible into the hands of their special representative, the Senate; and that body thus obtained its power to act as an executive council as a restraint on the President in appointments and treaties. This was the only survival of the first alignment of parties; but new divisions arose on almost every proposal introduced. The election of the President was given at various times to Congress and to electors chosen by the State legislatures; and the final mode of choice, by electors chosen by the States, was settled only two weeks before the end of the convention, the office of vice president coming in with it. The opponents and supporters of the slave trade compromised by agreeing not to prohibit it for 20 years. Another compromise included three-fifths of the slaves in enumerating population for representation. This provision gave the slave-holders abnormal power as the number of slaves increased.

Any explanation of the system introduced by the Constitution must start with the historical fact that, while the national Government was practically suspended, from 1776 until 1789, the only power to which political privileges had been given by the people was the States, and that the State legislatures were, when

the convention met, politically omnipotent, with the exception of the few limitations imposed on them by the early State constitutions. The general rule, then, is that the Federal Government has only the powers granted to it by the Federal Constitution, while the State has all governmental powers not forbidden to it by the State or the Federal Constitution. But the phrase defining the Federal Government's powers is no longer "expressly granted," as in the Articles of Confederation, but merely "granted," so that powers necessary to the execution of granted powers belong to the Federal Government, even though not directly named in the Constitution. This question of the interpretation or "construction" of the Constitution is at the bottom of real national politics in the United States.

The Constitution.—Popular sovereignty, then, is the basis of the American system. But it does not, as does the British system, choose its legislative body and leave unlimited powers to it. It makes its "Constitution" the permanent medium of its orders or prohibitions to all branches of the Federal Government and to many branches of the State Governments: they must do what the Constitution directs and leave undone what it forbids. The people, therefore, are continually laying their commands on their governments; and they have instituted a system of Federal courts to ensure obedience to their commands. A British court must obey the Act of parliament; the American court is bound and sworn to obey the Constitution first, and the Act of Congress or of the State legislature only so far as it is warranted by the Constitution. But the American court does not deal directly with the act in question; it deals with individuals who have a suit before it. One of these individuals relies on an Act of Congress or of a State legislature; the act thus comes before the court for examination; and it supports the act or disregards it as "unconstitutional," or in violation of the Constitution. If the court is one of high rank, or one to which a decision may be appealed, as the U.S. Supreme Court, other courts follow the precedent, and the law falls to the ground.

The preamble states that "we, the people of the United States," establish and ordain the Constitution. Events have shown that it was the people of the whole United States that established the Constitution, but the people of 1787 seem to have inclined to the belief that it was the people of each State for itself. This belief was never changed in the south; and in 1861 the people of that section believed that the ordinances of secession were merely a repeal of the enacting clause by the power which had passed it, the people of the State. For an account of the form of Government established by the Constitution *see* UNITED STATES: *Constitution and Government.*

The Constitution's leading difference from the Confederation is that it gives the national government power over individuals. The Federal courts are the principal agents in securing this essential power; without them, the Constitution might easily have been as dismal a failure as the Confederation. It has also been a most important agent in securing to the national government its supremacy over the States. From this point of view the most important provision of the Constitution is the grant of jurisdiction to Federal courts in cases involving the construction of the Constitution or of laws or treaties made under it. The 25th section of the Judiciary Act of 1789 permitted any Supreme Court justice to grant a writ of error to a State court in a case in which the constitutionality of a Federal law or treaty had been denied, or in which a State law objected to as in violation of the Federal Constitution had been maintained. In such cases, the defeated party had the right to carry the "Federal question" to the Federal courts. It was not until 1816 that the Federal courts undertook to exercise this power; it raised a storm of opposition, but it was maintained, and has made the Constitution what it professed to be—"the supreme law of the land."

Sovereignty.—The system of the United States is almost the only national system, in active and successful operation, as to which the exact location of the sovereignty is still a mooted question. The contention of the Calhoun school—that the separate States were sovereign before and after the adoption of the Constitution, that the Union was purely voluntary, and that the whole people, or the people of all the other States, had no right to maintain or enforce the Union against any State—has been ended by the Civil War. But that did not decide the location of the sovereignty. The prevalent opinion is still that first formulated by Madison: that the States were sovereign before 1789; that they then gave up a part of their sovereignty to the Federal Government; that the Union and the Constitution were the work of the States, not of the whole people; and that reserved powers are reserved to the people of the States, not to the whole people.

By whatever sovereignty the Constitution was framed and imposed, it was meant only as a scheme in outline, to be filled up afterwards, and from time to time, by legislation. The idea is most plainly carried out in the Federal judiciary: the Constitution only directs that there shall be a Supreme Court, and marks out the general jurisdiction of all the courts, leaving Congress, under the restriction of the President's veto power, to build up the system of courts. But the same idea is visible in every department, and it has carried the Constitution safely through a period which has radically altered every other civilized Government. It has combined elasticity with the limitations necessary to make democratic government successful over a vast territory, having infinitely diverse interests, and needing, more than almost anything else, positive opportunities for sober second thought by the people. A sudden revolution of popular thought or feeling is enough to change the House of Representatives from top to bottom; it must continue for several years before it can make a radical change in the Senate, and for years longer before it can carry this change through the judiciary, which holds for life; and all these changes must take place before the full effects upon the laws or Constitution are accomplished. But minor changes are reached easily and naturally in the course of legislation.

Submission to Congress.—The convention adjourned on Sept. 17, 1787, having adopted the Constitution. Its last step was a resolution that the Constitution be sent to the Congress of the Confederation, with the recommendation that it be submitted to conventions elected by the people of each State for ratification or rejection; that, if nine States should ratify it, Congress should appoint days for the popular election of electors, and that then the new Congress and President should, "without delay, proceed to execute this Constitution." Both Congress and the convention were careful not to open the dangerous question, How was a Government which was not to be changed but by the legislatures of all the States to be entirely supplanted by a different system through the approval of conventions in three-fourths of them?

Action of the States.—Before the end of the year Delaware, Pennsylvania and New Jersey had ratified; and Georgia, Connecticut and Massachusetts followed during the first two months of 1788. Thus far the only strong opposition had been in Massachusetts, a "large State." In it the struggle began between the friends and the opponents of the Constitution, with its introduction of a strong Federal power; and it raged in the conventions, legislatures, newspapers and pamphlets. In a classic series of papers, the *Federalist,* Alexander Hamilton, with the assistance of James Madison and John Jay, explained the new Constitution and defended it.

The seventh and eighth States—Maryland and South Carolina—ratified in April and May 1788; and, while the conventions of Virginia and New York were still wrangling over the great question, the ninth State, New Hampshire, ratified, and the Constitution passed out of theory into fact. The Anti-Federalists of the Virginia and New York conventions offered conditional ratifications of all sorts; but the Federalists stubbornly refused to consider them, and at last, by very slender majorities, these two states ratified. North Carolina for a time refused to ratify the Constitution. In Rhode Island it was referred to the several towns instead of to a convention and was at first rejected by a majority, the Federalists, who advocated the calling of a convention, refraining from voting. Congress named the first Wednesday of January 1789 as the day for the choice of electors, the first Wednesday in February for the choice of President and vice president, and the first Wednesday in March for

the inauguration of the new Government, at New York city. The last date fell on March 4, which continued the limit of each President's term for a century and a half.

When the votes of the electors were counted before Congress, it was found that Washington had been unanimously elected President, and that John Adams, standing next on the list, was vice president. Long before the inauguration the Congress of the Confederation had expired of mere inanition; its attendance simply ran down until (Oct. 21, 1788) its record ceased, and the United States got on without any national government for nearly six months. The struggle for nationality had been successful, and the old order faded out of existence.

Slavery.—The first census (1790) followed so closely upon the inauguration of the Constitution that the country may fairly be said to have had a population of near four millions in 1789. Something over half a million of these were slaves, of African birth or blood. Slavery of this sort had taken root in almost all the Colonies its original establishment being everywhere by custom. When the custom had been sufficiently established statutes came in to regulate a relation already existing. But it is not true, as the Dred Scott decision held long afterwards, that the belief that slaves were chattels simply, things, not persons, held good at the time of the adoption of the Constitution. Times had changed somewhat. The peculiar language of the Constitution itself, describing a slave as a 'person held to service or labour," under the laws of any State, puts the general feeling exactly: slaves were persons from whom the laws of some of the States withheld personal rights for the time. In accordance with this feeling most of the Northern States were on the high road towards abolition of slavery. Vermont had never allowed it. In Massachusetts it was swept out by a summary court decision that it was irreconcilable with the new State Constitution. Other States soon began systems of gradual abolition, which finally extinguished slavery north of Maryland, but so gradually that there were still 18 apprentices for life in New Jersey in 1860, the last remnants of the former slave system. In the new States north of the Ohio slavery was prohibited by the ordinance of 1787 and the prohibition was maintained in spite of many attempts to get rid of it and introduce slavery.

The sentiment of thinking men in the south was exactly the same, or in some cases more bitter from their personal entanglement with the system. Jefferson's language as to slavery is irreconcilable with the chattel notion; no abolitionist agitator ever used warmer language than he. Washington, George Mason and other southern men were almost as warm against slavery as Jefferson, and there were societies for the abolition of slavery in the south. In the Constitutional Convention of 1787 the strongest opposition to an extension of the period of non-interference with the slave trade from 1800 to 1808 came from Virginia, whereas every one of the New England States voted for this extension. Like most slave laws, the laws of the southern states were harsh: rights were almost absolutely withheld from the slave, and punishments of the severest kind were legal; but the execution of the system was milder than its legal possibilities might lead one to imagine. The country was as yet so completely agricultural that southern slavery kept all the patriarchal features possible to such a system.

Industries.—Indeed, the whole country was almost exclusively agricultural, and, in spite of every effort to encourage manufactures by State bounties, they formed the meagrest element in the national production. Connecticut, which now teems with manufactures, was just beginning the production of tinware and clocks; Rhode Island and Massachusetts were just beginning to work in cotton from models of jennies and Arkwright machinery surreptitiously obtained from England, and other States, beyond local manufactures of paper, glass and iron, were almost entirely agricultural, or were engaged in industries directly dependent on agriculture.

Population.—There were but five cities in the United States having a population of more than 10,000—New York (33,000), Philadelphia (28,500), Boston (18,000), Charleston (16,000) and Baltimore (13,000). The revenues of the new Government in 1790 were only $4,000,000; the expenditures, excluding interest on the public debt, but $1,000,000. It is not easy for the modern American to realize the poverty and weakness of his country at the inauguration of the new Government.

Travel.—Outside the cities communication was slow. One stage a week was enough for the connection between the great cities; and communication elsewhere depended on private conveyance. The western settlements were just beginning to make the question more serious. Enterprising land companies were the moving force which had impelled the passage of the ordinance of 1787; and the first column of their settlers was pouring into Ohio and forming connection with their predecessors in Kentucky and Tennessee. Marietta and Cincinnati had been founded. But the intending settlers were obliged to make the journey down the Ohio river from Pittsburgh in bullet-proof flat-boats, for protection against the Indians, and the return trip depended on the use of oars. For more than 20 years these flat-boats were the chief means of river commerce in the West; and in the longer trips, as to New Orleans the boats were generally broken up at the end and sold for lumber. John Fitch and others were already experimenting on what was soon to be the steamboat; but the statesman of 1789, looking at the task of keeping under one government a country of such distances, with such difficulties of communication, naturally felt anxiety as to the future.

Literature.—The comparative isolation of the people everywhere, the lack of books, the poverty of the schools and newspapers, were all influences which worked strongly against any pronounced literary development. Poems, essays and paintings were feeble imitations of European models; history was annalistic, if anything; and the drama hardly existed. In two points the Americans were strong, and had done good work. Such men as Jonathan Edwards had excelled in various departments of theology, and American preaching had reached a high degree of quality and influence; and, in the line of politics, the American State papers rank among the very best of their kind. Having a very clear perception of their political purposes, and having been restricted in study and reading to the great masters of pure and vigorous English, and particularly to the English translators of the Bible, the American leaders came to their work with an English style which could hardly have been improved. The writings of Franklin, Washington, the Adamses, Hamilton, Jefferson, Madison, Jay and others show the secret of their strength in every page. Much the same reasons, with the influences of democracy, brought oratory, as represented by Patrick Henry, Fisher Ames, John Randolph and others, to a point not very far below the mark afterwards reached by Daniel Webster. The effect of these facts on the subsequent development of the country is not often estimated at its full value.

Limits of Settlement.—The cession of the "North-west Territory" by Virginia and New York had been followed by similar cessions by Massachusetts (1785), Connecticut (1786) and South Carolina (1787). North Carolina did not cede Tennessee until early in 1790, nor Georgia her western claims until 1802. Settlement in all these regions was still very sparse. The centres of western settlement, in Tennessee and Kentucky, had become more firmly established, and a new one, in Ohio, had just been begun. The whole western limits of settlement of the old 13 States had moved much nearer their present boundaries; and the acquisition of the western title, with the liberal policy of organization and government which had been begun, was to have its first clear effects during the first decade of the new government. Almost the only obstacle to its earlier success had been the doubts as to the attitude which the Spanish authorities, at New Orleans and Madrid, would take towards the new settlements. They had already asserted a claim that the Mississippi was an exclusively Spanish stream from its mouth up to the Yazoo, and that no American boat should be allowed to sail on this part of it. To the western settler the Alleghenies and bad roads were enough to cut him off from any other way to a market than down the Mississippi; and it was not easy to restrain him from a forcible defiance of the Spanish claim. The northern States were willing to allow the Spanish claim for

a period of years in return for a commercial treaty; the southern States and the western settlers protested angrily; and once more the spectre of dissolution appeared, not to be laid again until the new Government had made a treaty with Spain in 1795 securing common navigation of the Mississippi.

The Development of Democracy, 1789–1801.—All the tendencies of political institutions in the United States had been towards democracy; but the leading men were not unanimous in their agreement with this tendency. Not a few of them were pronounced republicans even before 1775, but the mass of them had no great objections to a monarchical form of government until the war spirit had converted them. The Declaration of Independence had been directed rather against *the* King than against *a* king. Even after popular sovereignty had pronounced against a king, class spirit was for some time a fair substitute for aristocracy. As often happens, democracy at least thought of a Caesar when it apprehended class control. Certain discontented officers of the Continental Army proposed to Washington that he become king, but he promptly and indignantly put the offer by.

The State constitutions were democratic, except for property or other restrictions on the right of suffrage, or provisions carefully designed to keep the control of at least one house of the State legislature "in the hands of property." The Federal Constitution was so drawn that it would have lent itself kindly either to class control or to democracy. The electoral system of choosing the President and vice president was altogether anti-democratic, though democracy has conquered it: not an elector, since 1796, has disobeyed the purely moral claim of his party to control his choice. Since the Senate was to be chosen by the State legislatures, "property," if it could retain its influence in those bodies, could control at least one house of Congress. Whether the Constitution was to have a democratic or an anti-democratic interpretation was to be settled in the next 12 years.

Immigration.—The States were a strong factor in the final settlement, from the fact that the Constitution had left to them the control of the elective franchise: they were to make its conditions what each of them saw fit. Religious tests for the right of suffrage had been quite common in the Colonies; property tests were almost universal. The religious tests disappeared shortly after the War of Independence; the property tests survived in some of the States far into the constitutional period. But the desire to attract immigration was always a strong impelling force to induce States, especially frontier States, to make the acquisition of full citizenship and political rights as easy and rapid as possible. This force was not so strong at first as it was after the great stream of immigration began about 1848, but it was enough to tend constantly to the development of democracy.

Organization of the New Government.—The Anti-Federalists had been a political party, but a party with but one principle. The absolute failure of that principle deprived the party of all cohesion; and the Federalists controlled the first two Congresses almost entirely. Their pronounced ability was shown in their organizing measures, which still govern the American system very largely. The departments of State, of the Treasury, of War, of Justice and of the Post Office were rapidly and successfully organized; acts were passed for the regulation of seamen, commerce, tonnage duties, lighthouses, intercourse with the Indians, territories and the militia; a national capital was selected; a national bank was chartered; the national debt was funded, and the State debts were assumed as part of it. The first four years of the new system showed that the States had now to deal with a very different power from the impotent Congress of the Confederation. The new power was even able to exert pressure upon the two States which had not ratified the Constitution. As a first step, the higher duties imposed on imports from foreign countries were expressly directed to apply to imports from North Carolina and Rhode Island. North Carolina having called a second convention, her case was left to the course of nature; the second convention ratified the Constitution (Nov. 21, 1789). The Rhode Island legislature asked that their State might not be considered altogether foreigners, made their duties agree with those of the new government, and reserved the proceeds for "continental" purposes. Still no further steps were taken. A bill was therefore introduced, directing the President to suspend commercial intercourse with Rhode Island, and to demand from her her share of the continental debt. This was passed by the Senate, and needed but two steps further to become law. Newspaper proposals to divide the little State between her two nearest neighbours were stopped by her ratification of the Constitution (May 29, 1790). The "old 13" were thus united under the Constitution; and yet, so strong is the American prejudice for the autonomy of the States that these last two were allowed to enter in the full conviction that they did so in the exercise of sovereign freedom of choice.

Protection.—Protection was begun in the first tariff act, whose object, said its preamble, was the protection of domestic manufactures. The duties, however, ranged only from 7½ to 10%, averaging about 8½%. The system, too, had rather a political than an economic basis. Until 1789 the States had controlled the imposition of duties. The separate State feeling was a factor so strong that secession was a possibility which every statesman had to take into account. Hamilton's object, in introducing the system, seems to have been to create a class of manufacturers, running through all the States, but dependent for prosperity on the new Federal Government and its tariff. This would be a force which would make strongly against any attempt at secession. The same feeling seems to have been at the bottom of his establishment of a national bank, his assumption of State debts, and most of the general scheme which his influence forced upon the Federalist Party.

The First Cabinet.—In forming his cabinet Washington had paid attention to the opposing elements which had united for the temporary purpose of ratifying the Constitution. The national element was represented by Hamilton, secretary of the Treasury, and Henry Knox, secretary of War; the particularist element (using the term to indicate support of the States, not of a State) by Jefferson, secretary of State, and Edmund Randolph, Attorney General. At the end of 1792 matters were in train for the general recognition of the existence of two parties, whose struggles were to decide the course of the Constitution's development. The occasion came in the opening of 1793, when the new nation was first brought into contact with the French Revolution.

Jefferson.—The controlling tendency of Jefferson and his school was to the maintenance of individual rights at the highest possible point, as the Hamilton school was always ready to assert the national power to restrict individual rights for the general good. The Jefferson school supported the States, in the belief that they were the best bulwarks for individual rights. When the French Revolution began its course in America by agitation for the "rights of man," it met a sympathetic audience in the Jefferson party and a cold and unsympathetic hearing from the Hamilton school of Federalists, who were far more interested in securing the full recognition of the power and rights of the nation than in securing the individual against imaginary dangers, as they thought them. For ten years the surface marks of distinction between the two parties were to be connected with the course of events in Europe.

Hamilton.—The new Government was not yet four years old; it was not familiar, nor of assured permanency. The only national governments of which Americans had had previous experience were the British Government and the Confederation: in the British they had had no share, and the Confederation had had no power. The only places in which they had had long-continued, full and familiar experience of self-government were their State Governments. The governing principle of the Hamilton school, that the construction or interpretation of the terms of the Constitution was to be such as to broaden the powers of the Federal Government, necessarily involved a corresponding trenching on the powers of the States. It was natural, then, that the Jefferson school should look on every feature of the Hamilton programme as "anti-republican." The disposition of the Jefferson school to claim for themselves a certain peculiar title to the position of "republicans" developed into the appearance of the first Repub-

lican, or the Democratic-Republican, Party, about 1793.

Parties.—Many of the Federalists were shrewd and active business men, who naturally took prompt advantage of the opportunities which the new system offered. The Republicans therefore believed and asserted that the whole Hamilton programme was dictated by selfish or class interest; and they added this to the accusation of monarchical tendencies. These charges, with the fundamental differences of mental constitution, exasperated by the passion which differences as to the French Revolution seemed to carry with them everywhere, made the political history of this decade a very unpleasant record. The provision for establishing the national capital on the Potomac (1790) was declared to have been carried by a corrupt bargain; and accusations of corruption were renewed at every opportunity. In 1793 a French agent, Edmond Charles Edouard Genet (1765–1834), appeared to claim the assistance of the United States for the French republic, and went to the length of commissioning privateers, and endeavouring to secure recruits. Washington decided to issue a proclamation of neutrality, the first act of the kind in American history. It was the first indication, also, of the policy which has made the course of every President, with the exception of Polk, a determined leaning to peace, even when the other branches of the Government have been intent on war. Genet, however, continued his activities, and made outrageous demands upon the Government, so that finally Washington demanded and secured (1794) his recall. The proclamation of 1793 brought about the first distinctly party feeling; and it was intensified by Washington's charge that popular opposition in western Pennsylvania (1794) to the new excise law (*see* WHISKY INSURRECTION) had been fomented by the extreme French party. Their name, Democrat, was applied by the Federalists to the whole Republican Party as a term of contempt, but it was not accepted by the party for some 20 years; then the compound title "Democratic-Republican" became, as it long remained, the official title of the party. There was no party opposition, however, to the re-election of Washington in 1792, or to the admission of Vermont (1791), Kentucky (1792) and Tennessee (1796) as new States.

Jay's Treaty.—The British Government had accredited no minister to the United States, and it refused to make any commercial treaty or to give up the forts in the western territory of the United States, through which its agents still exercised a commanding influence over the Indians. In the course of its war with France, the neutral American vessels, without the protection of a national navy, fared badly. A treaty negotiated in 1794 by Chief Justice John Jay settled these difficulties for the following 12 years. But, as it engaged the United States against any intervention in the war on behalf of France, was silent on the subject of the right of search, and agreed to irksome limitations on the commercial privileges of the United States, the Republicans made it very unpopular, and the bitter personal attacks on Washington grew out of it. In spite of occasional Republican successes, the Federalists retained a general control of national affairs; they elected John Adams President in 1796, though Jefferson was chosen vice president with him; and the national policy of the Federalists kept the country out of entangling alliances with any of the European belligerents. To the Republicans, and to the French republic, this last point of policy was only a practical intervention against France and against the rights of man.

At the end of Washington's Administration the French Directory broke off relations with the United States, demanding the abrogation of Jay's treaty and a more pronounced sympathy with France. Adams sent three envoys, C. C. Pinckney, John Marshall and Elbridge Gerry, to endeavour to re-establish the former relations; they were met by demands for "money, a great deal of money," as a prerequisite to peace. They refused; their letters home were published, and the Federalists at last had the opportunity of riding the whirlwind of an intense popular desire for war with France. Intercourse with France was suspended by Congress (1798); the treaties with France were declared at an end; American frigates were authorized to capture French vessels guilty of depredations on American commerce, and the President was authorized to issue letters of marque and reprisal; and an American Army was formed, Washington being called from his retirement at Mount Vernon to command it. The war never went beyond a few sea fights, in which the little American Navy did itself credit, and Napoleon, seizing power the next year, renewed the peace which should never have been broken.

Decline of the Federalists.—The reaction in Great Britain against the indefinite "rights of man" had led Parliament to pass an alien law, a sedition law suspending the writ of *habeas corpus* and an act giving wide and loosely defined powers to magistrates for the dispersion of meetings to petition for redress of grievances. The Federalists were in control of a Congress of limited powers; but they were strongly tempted by sympathies and antipathies of every sort to form their programme on the model furnished from England. The measures which they actually passed were based only on that construction of the Constitution which is at the bottom of all American politics; they only tended to force the Constitution into an anti-democratic direction. But it was the fixed belief of their opponents that they meant to go farther, and to secure control by some wholesale measure of political persecution.

The Alien and Sedition Laws.—Three alien laws were passed in June and July, 1798. The first (repealed in April, 1802) raised the number of years necessary for naturalization from five to 14. The third permitted the arrest or removal of subjects of any foreign power with which the United States should be at war. The second, which is usually known as the Alien Law, was limited to a term of two years; it permitted the President to arrest or order out of the country any alien whom he should consider dangerous to the country. As many of the Republican editors and local leaders were aliens, this law really put a large part of the Republican organization in the power of the President. The Sedition Law (to be in force until March, 1801, and not renewed) made it a crime, punishable by fine and imprisonment, to publish or print any false, scandalous and malicious writings against the Government of the United States, either house of Congress, or the President, or to stir up sedition or opposition to any lawful act of Congress or of the President, or to aid the designs of any foreign power against the United States. In its first form the bill was even more sweeping than this and alarmed the opposition.

Most of the ability of the country was in the Federalist ranks; the Republicans had but two first-rate men—Jefferson and Madison. In the sudden issue thus forced between individual rights and national power, Jefferson and Madison could find but one bulwark for the individual—the power of the States; and their use of it gave their party a pronounced list to State sovereignty from which it did not recover for years. They objected to the Alien Law on the grounds that aliens were under the jurisdiction of the State, not of the Federal Government; that the jurisdiction over them had not been transferred to the Federal Government by the Constitution, and that the assumption of it by Congress was a violation of the Constitution's reservation of powers to the States; and, further, because the Constitution reserved to every "person," not to every citizen, the right to a jury trial. They objected to the Sedition Law on the grounds that the Constitution had specified exactly the four crimes for whose punishment Congress was to provide; that criminal libel was not one of them; and that the 1st amendment forbade Congress to pass any law restricting freedom of speech or of the press.

Virginia and Kentucky Resolutions.—The Republican objections might have been made in court, on the first trial. But the Republican leaders had strong doubts of the impartiality of the Federal judges, who were Federalists. They resolved to entrench the party in the State legislatures. The Virginia legislature in 1798 passed a series of resolutions prepared by Madison, and the Kentucky legislature in the same year passed a series prepared by Jefferson. Neglected or rejected by the other States, they were passed again by their legislatures in 1799. The leading idea expressed in both was that the Constitution was a "compact" between the States, and that the powers (the States) which had made the compact had reserved the power to restrain the creature of the compact, the Federal Government, whenever it undertook

ANIMALS OF THE UNITED STATES

1. Wild ducks (Anatidae) cross the U.S. during the migration season. They range from the Arctic circle in the summer to Panamá in the winter
2. Chipmunks (*Tamias striatus*) are native to wooded areas from Canada to Georgia
3. The American beaver (*Castor canadensis*) lives near small streams in northern mountainous areas throughout the U.S.
4. American bison (*Bison bison*), popularly called buffalo, now survives only in protected areas
5. Fur seal (Otariidae) ranges in its migrations from islands off Alaska south to Lower California
6. American barn owl (*Tyto alba*) inhabits the entire warmer region of North America
7. Northern banded or timber rattlesnake (*Crotalus horridus*), found from southwestern Maine and northern Florida to the western Gulf states
8. Young pelicans (*Pelecanus occidentalis*) of the Florida Everglades
9. Grizzly bears (*Ursus horribilis*), formerly found in western North America, are almost extinct
10. Mule deer (*Odocoileus hemionus*), found only in North America, ranges from Alaska to Lower California

PLANTS OF THE UNITED STATES

1. Spanish dagger (*Yucca aloifolia*), found along the southern Atlantic and Gulf coasts of the U.S., is widely used in landscaping
2. A grove of aspens (*Populus tremuloides*). Aspens grow from Pennsylvania to California, mostly in mountainous areas
3. Bear grass (*Xerophyllum tenax*) in bloom, native to mountainous districts from California to Montana
4. Mountain laurel (*Kalmia latifolia*) in bloom, surrounded by mossy lichens; both are found in rocky soil from Ontario, Can., to Florida
5. Suwarro or saguaro cactus (*Cereus giganteus*), native to arid districts of Arizona and southeastern California, grows to a height of 70 ft.
6. Jack pine (*Pinus banksiana*) near a Wisconsin lake. This variety of hard pine is found east of the Rocky mountains, from Minnesota to Kentucky
7. Apple (*Pyrus pumila*) and elm (*Ulmus americana*) trees. Apple trees range from the Atlantic to the Pacific coasts; elms west to the Rocky mountains
8. Western hemlock (*Tsuga heterophylla*) at Crater lake, Oregon. This tree grows from southeastern Alaska to northern Montana and central California
9. View of a northern hardwood forest in Pennsylvania. Large tree in the foreground is a sugar maple (*Acer saccharum*); smaller trees are beech (*Fagus grandifolia*) and black cherry (*Prunus serotina*)
10. Blue or Colorado spruce (*Picea pungens*), native to the central Rocky mountain region, grows from 80 to 150 ft. high
11. Cypress trees (*Taxodium distichum*) covered with Spanish moss (*Tillandsia usneoides*), typical of those found in gardens and swamps from Mexico to the southern Atlantic coast

SOME FAMOUS LANDMARKS IN UNITED STATES HISTORY

Top left: The Alamo, originally a Franciscan chapel, at San Antonio, Tex. There, in 1836, in the war for Texan independence, William B. Travis, Davy Crockett and James Bowie, with 180 men, withstood 4,000 Mexicans for 13 days

Top right: Granite portico over Plymouth rock, Plymouth, Mass., believed to have been the landing place of the Pilgrims, Dec. 21, 1620

Centre left: Liberty bell in Independence hall, Philadelphia, Pa. The bell was rung after the signing of the Declaration of Independence in 1776. First cracked in 1835 when it was rung at the death of Chief Justice John Marshall, it was later irreparably cracked on Washington's birthday in 1846

Centre: Fort McHenry, Baltimore, Md. During the bombardment of this fort by the British in 1814 Francis Scott Key wrote the words of "The Star-Spangled Banner"

Bottom left: Section of the moat of Ft. Marion, St. Augustine, Fla., originally built by the Spanish between about 1638 and 1756

Bottom right: San Jacinto monument, near Houston, Tex., commemorating Texas victory over a larger force of Mexicans in 1836. In the foreground, permanently moored in the San Jacinto river, is the U.S.S. "Texas," a World War II battleship

Virgin Islands	1917	26,665	133

to assume powers not granted to it. Madison's idea seems to have been that the restraint was to be imposed by a second convention of the States. Jefferson's idea is more doubtful; if it meant that the restraint should be imposed by any state which should feel aggrieved, his scheme was merely Calhoun's idea of nullification; but there are some indications that he agreed with Madison.

The first Congress of Adams's term of office ended in 1799. Its successor, elected in the heat of the French war excitement, kept the Federalist policy up to its first pitch. Out of Congress the execution of the objectionable laws had taken the shape of political persecution. Men were arrested, tried and punished for writings which the people had been accustomed to consider within legitimate political methods. The Republican leaders made every trial as public as possible, and gained votes constantly, so that the Federalists began to be shy of the very powers which they had sought. Every new election was a storm signal for the Federalist Party; and the danger was increased by schism in their own ranks.

Election of 1800.—Hamilton was now a private citizen of New York; but he had the confidence of his party more largely than its nominal head, the President, and he maintained close and confidential relations with the cabinet which Adams had taken unchanged from Washington. The Hamilton faction saw no way of preserving and consolidating the newly acquired powers of the Federal Government but by keeping up and increasing the war feeling against France; Adams had the instinctive leaning of an American President towards peace. Amid cries of wrath and despair from his party he accepted the first overtures of the new Napoleonic Government, sent envoys to negotiate a peace, and ordered them to depart for France when they delayed. Then, discovering flat treachery in his cabinet, he dismissed it and blurted out a public expression of his feeling that Hamilton and his adherents were "a British faction." Hamilton retorted with a circular letter to his party friends, denouncing the President; the Republicans intercepted it and gave it a wider circulation than its author had intended. The result depended on the electoral vote of New York; and Aaron Burr, who had introduced the drill and machinery of a modern American political party there, had made the State Republican and secured a majority for the Republican candidates. These (Jefferson and Burr) received the same number of electoral votes (73) and the House of Representatives (controlled by the Federalists) was thus called upon to decide which should be President. There was an effort by the Federalists to disappoint the Republicans by making Burr President; but Jefferson obtained that office, Burr becoming vice president for four years. This disputed election, however, led to the adoption in 1804 of the 12th amendment to the Constitution, which prescribed that each elector should vote separately for president and vice president, and thus prevent another tie vote of this kind.

The "Revolution of 1800" decided the future development of the United States. The new dominant party entered upon its career weighted with the theory of State sovereignty; and a civil war was necessary before this dogma, put to use again in the service of slavery, could be banished. But the democratic development never was checked. As the Republicans obtained control of the States they altered the State constitutions so as to cut out all the arrangements that favoured property or class interests, and reduced political power to the dead level of manhood suffrage. In most of the States outside of New England this process was completed before 1815; but New England tenacity was proof against the advancing revolution until about 1820. For 20 years after its downfall of 1800 the Federalist party maintained its hopeless struggle, and then it faded away into nothing, leaving as its permanent memorial the excellent organization of the Federal Government, which its successful rival hardly changed. Its two successors—the Whig and the second Republican party—have also been broad-constructionist parties, but they have admitted democracy as well.

The New Capital.—The disputed election of 1800 was decided in the new capital city of Washington, to which the Government had just been removed, after having been for ten years at Philadelphia. Its streets and parks existed only on paper. The Capitol had been begun; the Executive Mansion was unfinished, and its audience room was used by Mrs. Adams as a drying room for clothes; the congressmen could hardly find lodgings. The inconveniences were only an exaggeration of the condition of other American cities. Their sanitary conditions were bad, and yellow fever and cholera from time to time reduced several of them almost to depopulation. More than once during this decade the fever visited Philadelphia and New York, drove out most of the people, and left grass growing in the streets. The communication between the cities was still wretched. The traveller was subject to every danger that bad roads, bad carriages, bad horses, bad inns and bad police protection could combine to inflict upon him.

The West.—About this time the term "the West" appears. It meant then the western part of New York, the new territory north of the Ohio, and Kentucky and Tennessee. In settling land boundaries New York had transferred (1786) to Massachusetts, whose claims crossed her territory, the right to (but not jurisdiction over) a large tract of land in central New York, and to another large tract in the Erie basin. The sale of this land had carried population considerably west of the Hudson. Between 1790 and 1800 the population of Ohio had risen from almost nothing to 45,000, that of Tennessee from 36,000 to 106,000, and that of Kentucky from 74,000 to 221,000—the last-named State now exceeding six of the "old 13" in population. The difficulties of the western emigrant, however, were still enormous. He obtained land of his own, fertile land and plenty of it, but little else. The produce of the soil had to be consumed at home, or near it; ready money was scarce and distant products scarcer; and comforts, except the very rudest substitutes of home manufacture, were unobtainable. The number of post offices rose during these ten years from 75 to 903; the miles of post routes from 1,900 to 21,000, and the revenue from $38,000 to $231,000.

Patents.—The power of Congress to regulate patents was already bearing fruit. Until 1789 this power was in the hands of the States, and the privileges of the inventor were restricted to the territory of the patenting State. Now he had a vast and growing territory within which all the profits were his own. Twenty patents were issued in 1793, and 23,471 100 years later. One of the inventions of 1793 was Eli Whitney's cotton gin.

Cotton.—When the Constitution was adopted it was not known that the cultivation of cotton could be made profitable in the southern States. The "roller gin" could clean only 6 lb. a day by slave labour. In 1784 eight bags of cotton, landed in Liverpool from an American ship, had been seized on the ground that so much cotton could not be the produce of the United States. Eli Whitney invented the saw-gin, by which the cotton was dragged through parallel wires with openings too narrow to allow the seeds to pass; and one slave could now clean 1,000 lb. a day. The exports of cotton leaped from 189,000 lb. in 1791 to 21,000,000 lb. in 1801, and doubled in three years more. The influence of this one invention, combined with the wonderful series of British inventions which had paved the way for it, can hardly be estimated in its commercial aspects. Its political influences were even wider, but more unhappy. The introduction of the commercial element into the slave system of the South robbed it at once of the patriarchal features which had made it tolerable; while it developed in slaveholders a new disposition to defend a system of slave labour as a "positive good."

Slavery.—The development of a class whose profits were merely the extorted natural wages of the black labourer was certain; and its political power was as certain, though it never showed itself clearly until after 1830. And this class was to have a peculiarly distorting effect on the political history of the United States. Aristocratic in every sense but one, it was ultra-Democratic (in a purely party sense) in its devotion to State sovereignty, for the legal basis of the slave system was in the laws of the several States. In time the aristocratic element got control of the party which had originally looked to State rights as a bulwark of individual rights; and the party was finally committed to the employment of its original doctrine for an entirely different purpose—the suppression of the black labourer's wages.

Democracy and Nationality, 1801–29.—When Jefferson took office in 1801 his party, ignoring the natural forces which

tied the States together even against their wills, insisted that the legal basis of the bond was in the power of any State to withdraw at will. This was no nationality; and foreign nations naturally refused to take the American national coin at any higher valuation than that at which it was current in its own country. The urgent necessity was for a reconciliation between democracy and nationality; and this was the work of this period. An underlying sense of all this has led Democratic leaders to call the war of 1812–15 the "Second War of Independence"; the result was independence of past ideas as the first had been of Great Britain.

Louisiana.—The first force in the new direction was the acquisition of Louisiana in 1803. Napoleon had acquired it from Spain, and, fearing an attack upon it by Great Britain, offered it to the United States for $15,000,000. The Constitution gave the Federal Government no power to buy and hold territory, and the party was based on a strict construction of the Constitution. Possession of power forced the strict-construction party to broaden its ideas, and Louisiana was bought, though Jefferson quieted his conscience by talking for a time of a futile proposal to amend the Constitution so as to grant the necessary power. The acquisition of the western Mississippi basin more than doubled the area of the United States, and gave them control of all the great river systems of central North America. The difficulties of using these rivers were removed almost immediately by Robert Fulton's utilization of steam in navigation (1807). Within four years steamboats were at work on western waters; and thereafter the increase of steam navigation and that of population stimulated one another. The centre of population during this period advanced from about the middle of Maryland to its earlier extreme western limit; that is, the centre of population was in 1830 nearly at the place which had been the western limit of population in 1770.

The Oregon Country.—Jefferson also laid the basis for a further acquisition in the future by sending an expedition under Meriwether Lewis and William Clark to explore the territory north of the then Spanish territory of California and west of the Rocky Mountains—the "Oregon country" as it was afterwards called. The explorations of this party (1804–06), with Capt. Robert Gray's discovery of the Columbia river (1792), made the best part of the claims of the United States to the country 40 years later.

Election of 1804.—Jefferson was re-elected in 1804. His great success as President was the acquisition of Louisiana, which was a violation of his party principles; but all his minor successes were, like this, recognitions of the national sovereignty which he disliked so much. After a short and brilliant naval war the Barbary pirates were reduced to submission (1805). The long-continued control of New Orleans by Spain, and the persistent intrigues of the Spanish authorities, looking towards a separation of the whole western country from the United States, had been ended by the acquisition of Louisiana. There still existed a dangerous ignorance of Federal power and control, of which Aaron Burr took advantage (1806–07). Organizing an expedition in Kentucky and Tennessee, probably for the conquest of the Spanish colony of Mexico, he was arrested on the lower Mississippi and brought back to Virginia. He was acquitted; but the incident opened up a vaster view of the national authority than democracy had yet been able to take.

Jefferson and his party persistently refused to recognize the inherent power of the nation in international affairs. The Jay treaty expired in 1806 and American commerce was left to the course of events, Jefferson refusing to accept the only treaty which the British Government was willing to make. All the difficulties which followed may be summed up in a few words: the British Government was then the representative of the ancient system of restriction of commerce, and had a powerful Navy to enforce its ideas; the American Government was endeavouring to force into international recognition the system of neutral rights and unrestricted commerce, but its suspicious democracy refused to give it a navy sufficient to command respect.

Neutral Commerce.—Great Britain was now at war, from time to time, with almost every other nation of Europe. In time of peace European nations followed generally the old restrictive principle of allowing another nation, like the United States, no commercial access to their colonies; but, when they were at war with Great Britain, whose Navy controlled the ocean, they were very willing to allow the neutral American merchantmen to carry away their surplus colonial produce. Great Britain had insisted for 50 years that the neutral nation, in such cases, was really intervening in the war as an ally of her enemy; but she had so far modified her claim as to admit that "transhipment," or breaking bulk, in the United States was enough to qualify the commerce for recognition. The neutral nation thus gained a double freight, and grew rich in the traffic; the belligerent nations no longer had commerce afloat for British vessels to capture; and the "frauds of the neutral flags" became a standing subject of complaint among British merchants and naval officers. About 1805 British prize courts began to disregard transhipment and to condemn American vessels which made the voyage from a European colony to the mother country by way of the United States.

Impressment.—The question of expatriation, too, furnished a good many burning grievances. Great Britain maintained the old German rule of perpetual allegiance, though she had modified it by allowing the right of emigration. The United States, founded by immigration, was anxious to establish the right of the subject to divest himself of allegiance by naturalization under a foreign jurisdiction. Four facts thus tended to break off friendly relations: (1) Great Britain's claim to allegiance over American naturalized subjects; (2) her claim to the belligerent right of search of neutral vessels; (3) her claim of right to impress for her vessels of war her subjects who were seamen wherever found; and (4) the difficulty of distinguishing native-born American from British subjects, even if the right to impress naturalized American subjects were granted. British naval officers even undertook to consider all who spoke the English language as British subjects, unless they could produce proof that they were native-born Americans. The American sailor who lost his papers was thus open to impressment. A particularly flagrant case of seizure of Americans occurred in 1807. On June 27 the British ship "Leopard" fired upon the American frigate "Chesapeake," which, after having lost three men killed and 18 wounded, hauled down its flag; the British commander then seized four of the "Chesapeake's" crew. This action aroused intense anger throughout the country, and but for the impotence of the Government would undoubtedly have led to immediate war. The American Government in 1810 published the cases of such impressments since 1803 as numbering over 4,000, about one-third of the cases resulting in the discharge of the impressed man.

In May, 1806, the British Government, by orders in council, declared a blockade of the whole continent of Europe from Brest to the Elbe, about 800 miles. In November, after the battle of Jena, Napoleon answered by the "Berlin decree," in which he assumed to blockade the British Isles, thus beginning his "continental system." A year later the British Government answered by further orders in council, forbidding American trade with any country from which the British flag was excluded, allowing direct trade from the United States to Sweden only, in American products, and permitting American trade with other parts of Europe only on condition of touching in England and paying duties. Napoleon retorted with the "Milan decree," declaring good prize any vessel which should submit to search by a British ship; but this was evidently a vain fulmination.

The Navy.—The Democratic Party of the United States was almost exclusively agricultural and had little sympathy with commercial interests; it was pledged to the reduction of national expenses and the debt, and did not wish to take up the responsibility for a navy; and, as the section of country most affected by the orders in council, New England, was Federalist, a tinge of political feeling could not but colour the decisions of the dominant party. Various ridiculous proposals were considered as substitutes for a necessarily naval war; and perhaps the most ridiculous was adopted. Since the use of non-intercourse agreements as revolutionary weapons against Great Britain, an overweening confidence in such measures had sprung up, and one of them was now resorted to—the embargo of Dec. 22, 1807, forbidding foreign commerce altogether. It was expected to starve Great Britain

into a change of policy; and its effects may be seen by comparing the $20,000,000 exports of 1790, $49,000,000 of 1807 and $9,000,000 of 1808. It does not seem to have struck those who passed the measure that the agricultural districts also might find the change unpleasant; but that was the result, and their complaints reinforced those of New England. The pressure had been slightly relieved by the substitution of the Non-Intercourse Law of March 1, 1809; it prohibited commercial intercourse with Great Britain and France and their dependencies, leaving other foreign commerce open, prohibited the importation from any quarter of British and French goods, and forbade the entrance of British or French vessels, public or private, into any port of the United States. Madison, Jefferson's secretary of State, who succeeded Jefferson in 1809, assumed in the Presidency a burden which was not enviable. New England was in a ferment, and was suspected of designs to resist the restrictive system by force; and the Administration did not face the future with confidence.

The War of 1812.—The Non-Intercourse Law was to be in force only "until the end of the next session of Congress" and was to be abandoned as to either belligerent which should abandon its attacks on neutral commerce, and maintained against the other. In 1810 the American Government was led to believe that France had abandoned its system. Napoleon continued to enforce it in fact; but his official fiction served its purpose of limiting the non-intercourse for the future to Great Britain, and thus straining relations between that country and the United States still further. The elections of 1811–12 resulted everywhere in the defeat of "submission men" and in the choice of new members who were determined to resort to war against Great Britain. Henry Clay, John C. Calhoun, William H. Crawford and other new men seized the lead in the two houses of Congress, and forced Madison, it is said, to agree to a declaration of war as a condition of his renomination in 1812. Madison sent to Congress a confidential "war message" on June 1 and on the 18th war was declared. The national democracy meant to attack Great Britain in Canada, partly to gratify its western constituency, who had been harassed by Indian attacks, asserted to have been instigated from Canada. Premonitions of success were drawn from the battle of Tippecanoe, in which William Henry Harrison had defeated in 1811 the north-western league of Indians formed by Tecumseh. Between the solidly settled Atlantic States and the Canadian frontier was a wide stretch of unsettled or thinly settled country, which was itself a formidable obstacle to war. Ohio had been admitted as a State in 1802, and Louisiana was admitted in 1812; but their admission had been due to the desire to grant them self-government rather than to their full development in population and resources. Cincinnati was a little settlement of 2,500 inhabitants; the fringe of settled country ran not very far north of it; all beyond was a wilderness. The case was much the same with western New York. It would have been far less costly, as events proved, to have entered at once upon a naval war; but the crusade against Canada had been proclaimed all through Kentucky and the west, and their people were determined to wipe out their old scores before the conclusion of the war. (For the military and naval events of the war *see* WAR OF 1812, THE.)

The war opened with disaster—Gen. William Hull's surrender of Detroit; and disaster attended it for two years. Political appointments to positions in the regular army were numerous and such officers were worse than useless. Futile attempts at invasion were followed by defeat or abortion, until the political officers were weeded out at the end of the year 1813, and Jacob Brown, Winfield Scott, E. W. Ripley and others who had fought their way up were put in command. Then for the first time the men were drilled and brought into effective condition; two successful battles in 1814—Chippewa and Lundy's Lane—threw some glory on the end of the war. So weak were the preparations even for defence that a British expedition in 1814 met no effective resistance when it landed and burned Washington.

The American Navy was but a puny adversary for the British Navy, which had captured or shut up in port all the other navies of Europe. But the small number of American vessels, with the superabundance of trained officers, gave them one great advantage: the training and discipline of the men, and the equipment of the vessels, had been brought to the very highest point. "The art of handling and fighting the old broadside sailing frigate" had been carried in the little American Navy to an excellence which unvarying success and a tendency to fleet-combats had now made far less common among British captains. Altogether the American vessels gave a remarkably good account of themselves.

Hartford Convention.—The home dislike to the war had increased steadily with the evidence of incompetent management by the administration. The Federalists, who had always desired a navy, pointed to the naval successes as the best proof of folly with which the war had been undertaken. New England Federalists complained that the Federal Government utterly neglected the defence of their coast, and that southern influence was far too strong in national affairs. They showed at every opportunity a disposition to adopt the furthest stretch of State sovereignty, as stated in the Kentucky resolutions; and every such development urged the national democracy unconsciously further on the road to nationality. When the New England States sent delegates to meet at Hartford (Conn.), and consider their grievances and the best remedies, treason was suspected, and a readiness to suppress it by force was plainly shown. The recommendations of the convention came to nothing; but the attitude of the dominant party towards it is one of the symptoms of the manner in which the trials of actual war were steadily reconciling democracy and nationality. The object which Hamilton had sought by high tariffs and the development of national classes had been attained by more natural and healthy means.

Peace.—In April, 1814, the first abdication of Napoleon took place, and Great Britain was able to give more attention to her American antagonist. The main attack was to be made on Louisiana, the weakest and most distant portion of the Union. A fleet and army were sent thither, but the British assault was completely repulsed (Jan. 8, 1815) by the Americans under Andrew Jackson. Peace had been made at Ghent 15 days before the battle was fought, but the news of the battle and the peace reached Washington almost together.

The United States secured a fairly good treaty. It is true that it said not a word about the questions of impressment, search and neutral rights, the grounds of the war; Great Britain did not abandon her position on any of them. But everybody knew that circumstances had changed. The new naval power whose frigates alone in the past 20 years had shown their ability to fight English frigates on equal terms was not likely to be troubled in future with the question of impressment; and in fact, while not renouncing the right, the British Government no longer attempted to enforce it.

End of Federal Party.—The remainder of this period is one of the barrenest in American history. The opposition of the Federalist Party to the war completed the measure of its unpopularity, and it had only a perfunctory existence for a few years longer. Scandal, intrigue and personal criticism became the most marked characteristics of American politics until the dominant party broke at the end of the period, and real party conflict was renewed. But the seeds of the final disruption are visible from the peace of 1814. The old-fashioned Republicans looked with intense suspicion on the new form of Republicanism generated by the war, a type which instinctively bent its energies toward the further development of national power. Clay was the natural leader of the new Democracy; but John Quincy Adams and others of Federalist antecedents or leanings took to the new doctrines kindly; and even Calhoun, Crawford and others of the southern interest were at first strongly inclined to support them. One of the first effects was the revival of protection and of a national bank.

The Bank.—The charter of the national bank had expired in 1811, and the dominant party had refused to recharter it. The attempt to carry on the war by loans resulted in almost a bankruptcy and in a complete inability to act efficiently. As soon as peace gave time for consideration, a second bank was chartered (April 10, 1816) for 20 years with a capital of $35,000,000, one-fifth of which was to be subscribed for by the national Govern-

ment. It was to have the custody of the Government revenues, but the secretary of the Treasury could divert the revenues to other custodians, giving his reasons for such action to Congress.

Protection.—Protection was advocated again on national grounds, but not quite on those which had moved Hamilton. The additional receipts were now to be expended for fortifications and other national defences, and for national roads and canals. The war and blockade had been an active form of protection, under which American manufactures had sprung up. As soon as peace was made English manufacturers drove their American rivals out of business or reduced them to desperate straits. Their cries for relief had a double effect. They gave the spur to the nationalizing advocates of protection, and, as most of the manufacturers were in New England or New York, they developed in the citadel of Federalism a class which looked for help to a Republican Congress. This was the main force which brought New England into the Republican fold before 1825. An increase in the number of spindles from 80,000 in 1811 to 500,000 in 1815, and in cotton consumption from 500 bales in 1800 to 90,000 in 1815, the rise of manufacturing towns, and the rapid development of the mechanical tendencies of a people who had been hitherto almost exclusively agricultural, were influences which were to be reckoned with in the politics of a democratic country.

Tariff of 1816.—The tariff of 1816 imposed a duty of about 25% on imports of cotton and woollen goods, and specific duties on iron imports, except pig-iron, on which there was an *ad valorem* duty of 20%. In 1818 this duty also was made specific (50 cents a cwt.). The *ad valorem* duties carried most of the manufacturers through the financial crisis of 1818–19, but the iron duties were less satisfactory. In English manufacture the substitution of coke for charcoal in iron production led to continual decrease in price. As the price went down the specific duties were continually increasing the absolute amount of protection. Thus spared the necessity for improvements in production, the American manufacturers felt English competition more keenly as the years went by, and called for more protection.

Era of Good Feeling.—James Monroe succeeded Madison as President in 1817, and, re-elected with hardly any opposition in 1820, he served until 1825. So complete was the supremacy of the Republican Party that this is often called "the era of good feeling." It came to an end when a successor to Monroe was to be elected; the two sections of the dominant party then had their first opportunity for open struggle. During Monroe's two terms of office the nationalizing party developed the policy on which it proposed to manage national affairs. This was largely the product of the continually swelling western movement of population. The influence of the steamboat was felt more and more every year, and the want of a similar improvement in land transport was correspondingly evident. The attention drawn to western New York by the war had filled that part of the State with a new population. The southern Indians had been completely overthrown by Andrew Jackson during the war of 1812, and forced to cede their lands. The admission of the new States of Indiana (1816), Mississippi (1817), Illinois (1818), Alabama (1819), Maine (1820) and Missouri (1821)—all but Maine the product and evidence of western growth—were the immediate results of the development consequent upon the war. All the territory east of the Mississippi, except the northern part of the North-west Territory, was now formed into self-governing States; the State system had crossed the Mississippi; all that was needed for further development was the locomotive engine. The 4,000,000 of 1790 had grown into 13,000,000 in 1830.

The "American System."—The urgent demand of western settlers for some road to a market led to a variety of schemes to facilitate intercourse between the east and the west—the most successful being that completed in New York in 1825, the Erie canal. The Hudson river forms the great natural breach in the barrier range which runs parallel to the Atlantic coast. When the traveller has passed up the Hudson through that range he sees before him a vast champaign country extending westward to the Great Lakes, and perfectly adapted by nature for a canal. Such a canal, to turn western traffic into the lake rivers and through the lakes, the canal, and the Hudson to New York city, was begun by the State through the influence of De Witt Clinton. It was derisively called "Clinton's big ditch" until its completion laid the foundations for the great commercial prosperity of New York State and city. Long before it was finished the evident certainty of its success had enticed other States into far less successful enterprises of the kind and had established as a nationalizing policy the combination of high tariffs and expenditures for internal improvements which was long known as the "American system." The tariffs or duties on imports were to be carried as high as revenue results would justify; the superabundant revenues were to be expended on enterprises which would tend to aid the people to subdue the continent. Protection was now to be for national benefit, not for the benefit of classes. Western farmers were to have manufacturing towns at their doors, as markets for the surplus which had hitherto been rotting on their farms; competition among manufacturers was to keep down prices; and Henry Clay's eloquence was to commend the whole policy to the people. The old democracy, particularly in the south, insisted that the whole scheme really had its basis in benefits to classes, that its communistic features were not such as the Constitution meant to cover by its grant of power to Congress to levy taxation for the general welfare. The dissatisfaction in the South rose higher when the tariffs were increased in 1824 and 1828. The proportion of customs revenue to dutiable imports rose to 37% in 1825 and to 44% in 1829; and the ratio to aggregate imports to 33% in 1825 and 37% in 1829.

The Monroe Doctrine.—In international relations the action of the Government was strong, quiet and self-respecting. Its first weighty action took place in 1823. It had become pretty evident that the Holy Alliance meant to aid Spain in bringing her revolted South American colonies to obedience. Great Britain had been drifting steadily away from the alliance, and George Canning, the new secretary, determined to call in the weight of the transatlantic power as a check upon it. A hint to the American minister was followed by a few pregnant passages in Monroe's annual message in December. "We could not view," he said, "any interposition for the purpose of oppressing them [the South American States], or controlling in any other manner their destiny by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States." If both the United States and Great Britain were to take this ground the fate of a fleet sent by the Alliance across the Atlantic was not in much doubt, and the project was at once given up.

It was supposed at the time that Spain might transfer her colonial claims to some stronger power; and Monroe therefore said that "the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers." This declaration and that quoted above constitute together the "Monroe Doctrine" as originally proclaimed. The doctrine has remained the rule of foreign intercourse for all American parties.

Oregon.—By a treaty with Russia (1825) that power gave up all claims on the Pacific coast south of the present limits of Alaska. The northern boundary of the United States had been defined by the treaty of 1783; and, after the acquisition of Louisiana, a convention with Great Britain (1818) settled the boundary on the line of 49° N. lat. as far west as the Rocky Mountains. West of these mountains the so-called Oregon country, on whose limits the two powers could not agree, was to be held in common possession for ten years. This common possession was prolonged by another convention (1827) indefinitely, with the privilege to either power to terminate it, on giving 12 months' notice. This arrangement lasted until 1846.

Election of 1824.—Monroe's term of office came to an end in March 1825. He had originally been an extreme Democrat, who could hardly speak of Washington with patience; he had slowly modified his views, and his tendencies were now eagerly claimed by the few remaining Federalists as identical with their own. All the candidates for the Presidency in 1824—Andrew Jackson, a private citizen of Tennessee; William H. Crawford, Monroe's

secretary of the treasury; John Quincy Adams, his secretary of State; and Henry Clay, the Speaker of the House of Representatives—claimed to be Republicans alike; but the personal nature of the struggle was shown by the tendency of their supporters to call themselves "Adams men" or "Jackson men," rather than by any real party title. Calhoun was supported by all groups for the vice presidency, and was elected without difficulty. The choice of a president was more doubtful.

Party Changes.—None of the four candidates had anything like a party organization behind him. Adams and Clay represented the nationalizing element, as Crawford and Jackson did not; but there the likeness among them stopped. The strongest forces behind Adams were the new manufacturing and commercial interests of the East; behind Clay were the desires of the West for internal improvements: and the two elements were soon to be united into the National Republican or Whig Party. Crawford was the representative of the old Democratic Party, with all its Southern influences and leanings. Jackson was the personification of the new democracy—not very cultured, perhaps, but honest, and hating every shade of class control instinctively. As he became better known the whole force of the new drift of things turned in his direction. Crawford was taken out of the race, just after the electors had cast their votes, by physical failure, and Adams, later, by the revival of ancient quarrels with the Federalists of New England; and the future was to be with Clay or with Jackson. But in 1824 the electors gave no one a majority; and the House of Representatives, voting by States, gave the presidency to Adams.

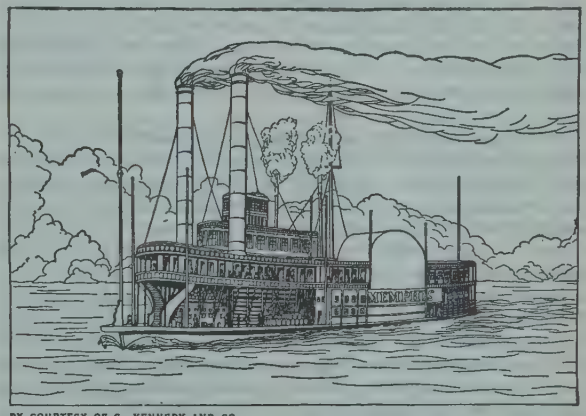
Adams' election in 1825 was due to the fact that Clay's friends in the House—unable to vote for him, as he was the lowest in the electoral vote, and only three names were open to choice in the House—very naturally gave their votes to Adams. As Adams appointed Clay to the leading position in his cabinet, the defeated party at once raised the cry of "bargain and intrigue," one of the most effective in a democracy, and it was kept up throughout Adams' four years of office. Jackson had received the largest number of electoral votes, though not a majority and the hazy notion that he had been injured because of his devotion to the people increased his popularity. Though demagogues made use of it for selfish purposes, this feeling was an honest one, and Adams had nothing to oppose to it. He tried vigorously to uphold the "American system," and succeeded in passing the tariff of 1828; he tried to maintain the influence of the United States on both the American continents; but he remained as unpopular as his rival grew popular. In 1828 Adams was easily displaced by Jackson, the electoral vote being 178 to 83. Calhoun was re-elected vice president.

Triumph of Jackson.—Jackson's inauguration in 1829 closes this period, as it ends the time during which a disruption of the Union by the peaceable withdrawal of any State was even possible. The party which had made State sovereignty its bulwark in 1798 was now in control of the Government again; but Jackson's proclamation in his first term, in which he warned South Carolina that "disunion by armed force is treason," and that blood must flow if the laws were resisted, speaks a very different tone from the speculations of Jefferson on possible future divisions of the United States. Even the sudden attempt of South Carolina to exercise independent action shows that some interest dependent upon State sovereignty had taken alarm at the drift of events, and was anxious to lodge a claim to the right before it should slip from its fingers for ever.

Slavery.—When the vast territory of Louisiana was acquired in 1803 the new owner found slavery already established there. Congress tacitly ratified existing law by taking no action; slavery continued legal, and spread further through the territory; and the State of Louisiana entered as a slave State in 1812. The next State to be carved out of the territory was Missouri, admitted in 1821. A territory, on applying for admission as a State, brings a Constitution for inspection by Congress; and when it was found that the new State of Missouri proposed to recognize and continue slavery, a vigorous opposition spread through the North and West, and carried most of the senators and representatives from those sections with it. In the House of Representatives these two sections had a greatly superior number of members; but, as the number of Northern and Southern States had been kept about equal, the compact Southern vote, with one or two Northern allies, generally retained control of the Senate. Admitted by the Senate and rejected by the House, Missouri's application hung suspended for two years until it was successful by the admission of Maine, a balancing Northern State, and by the following arrangement, known as the Missouri Compromise of 1820: Missouri was to enter as a slave State; slavery was forever prohibited throughout the rest of the Louisiana Purchase north of lat. 36° 36′, the main southern boundary of Missouri; and, though nothing was said of the territory south of the compromise line, it was understood that any State formed out of it was to be a slave State, if it so wished. Arkansas entered under this provision in 1836.

The question of slavery was thus set at rest for the present, though a few agitators were roused to more zealous opposition to the essence of slavery itself. In the next decade these agitators succeeded only in the conversion of a few recruits, but these recruits were the ones who took up the work at the opening of the next period. It is plain now, however, that North and South had already drifted so far apart as to form two sections, and it became evident during the next forty years that the wants and desires of these two sections were so divergent that it was impossible for one Government to make satisfactory laws for both.

The Settled Area.—The vast flood of human beings which had been pouring westward for years had now pretty well occupied the territory east of the Mississippi, while, on the west side of that stream, it still showed a disposition to hold to the river valleys. The settled area had increased from 240,000sq.m. in 1790 to 633,000sq.m. in 1830, with an average of 20·3 persons to the sq. mile. There was still a great deal of Indian territory in the Southern States of Georgia, Alabama, Mississippi and Florida, for the Southern Indians were among the finest of their race; they had become semi-civilized, and were formidable antagonists to the encroaching white race. The States interested had begun preparations for their forcible removal, in public defiance of the attempts of the Federal Government to protect the Indians



BY COURTESY OF S. KENNEDY AND CO.

A MISSISSIPPI RIVER STEAM BOAT IN THE EARLY DAYS

Before the advent of the steamboat the river trip from Louisville to New Orleans consumed from three to four months. In 1820 steamboats made the trip in less than 20 days; and in 1838, in 6 days. This improved facility of transportation was influential in increasing the population of the Mississippi Valley

(1827); but the removal was not completed until 1835. In the North, Wisconsin and Michigan, with the northern halves of Illinois and Indiana, were still very thinly settled, but everything indicated early increase of population. The first lake steamboat, the "Walk-in-the-Water," had appeared at Detroit in 1818, and the opening of the Erie canal in 1825 added more vessels.

The land system of the United States had much to do with the early development of the West. From the first settlement, the universally recognized rule had been that of absolute individual property in land, with its corollary of unrestricted competitive

or "rack" rents; and this rule was accepted fully in the national land system. The public lands were to be divided into "hundreds" each ten miles square and containing 100 mile-square plots. The hundred was called a "township," and was afterwards reduced to six miles square, of 36 mile-square plots of 640ac. each. From time to time principal meridians and east and west base lines have been run, and townships have been determined by their relations to these lines. The price fixed in 1790 as a minimum was $2 per ac.; in 1820 it was reduced to $1.25 per ac.; it has tended to decrease, and no effort has ever been made to gain a revenue from it. When the nation acquired its western territory it secured its title to the soil, and always made it a fundamental condition of the admission of a new State that it should not tax United States lands. To compensate the new States for the freedom of unsold public lands from taxation, one township in each 36 was reserved to them for educational purposes; and the excellent public school systems of the Western States have been founded on this provision. The cost of obtaining a quarter section (160ac.), under the still later homestead system of granting lands to actual settlers, came to be only about $26 to cover fees for filing claim and granting title; the interest on this, at 6%, represents an annual rent of one cent per acre—making this, says F. A. Walker, as nearly as possible the "no-rent land" of the economists.

The bulk of the early westward migration was of home production; the great immigration from Europe did not begin until about 1847. The West as well as the East thus had its institutions fixed before being called upon to absorb an enormous foreign element.

Industrial Development and Sectional Divergence, 1829–50.—The years 1829–37 have been called "the reign of Andrew Jackson"; his popularity, long struggle for the presidency, and his feeling of his official ownership of the subordinate offices gave to his administration at least an appearance of Caesarism. But it was a strictly constitutional Caesarism; the restraints of written law were never violated, though the methods adopted within the law were new to national politics. Since about 1800 State politics in New York and Pennsylvania had been noted for the systematic political use of the offices. The presence of New York and Pennsylvania politicians in Jackson's cabinet taught him to use the same system. Removals, except for cause, had been relatively rare before; but under Jackson men were removed almost exclusively for party purposes and a clean sweep was made in the civil service. Other parties adopted the system, and it remained the rule at a change of administration until near the end of the century.

Parties.—The system brought with it a semi-military reorganization of parties. Hitherto nominations for the more important offices had been made mainly by legislative caucuses; candidates for president and vice-president were nominated by caucuses of congressmen, and candidates for the higher State offices by caucuses of the State legislatures. Late in the preceding period "conventions" of delegates from the members of the party in the State were held in New York and Pennsylvania; and in 1831–32 this became the rule for presidential nominations. It rapidly developed into systematic State, county and city "conventions"; and the result was the appearance of that complete political machinery, the American political party. The Democratic machinery was the first to appear, in Jackson's second term (1833–37). Its workers were paid in offices, or hopes of office, so that it was said to be built on the "cohesive power of public plunder"; but its success was immediate and brilliant. The opposing party, the Whig Party, had no chance of victory in 1836; and its complete overthrow drove its leaders into the organization of a similar machinery of their own, which scored its first success in 1840.

Bank of the U.S.—The Bank of the United States had hardly been heard of in politics until the new Democratic organization came into hostile contact with it. A semi-official demand upon it for a political appointment was met by a refusal; and the party managers called Jackson's attention to an institution which he could not but dislike the more he considered it. His first message spoke of it in unfriendly terms, and every succeeding message brought a more open attack. The old party of Adams and Clay had by this time taken the name of Whigs, probably from the notion that they were struggling against "the reign of Andrew Jackson," and they adopted the cause of the bank with eagerness. The bank charter did not expire until 1836, but in 1832 Clay brought up a bill for a new charter. It was passed and vetoed; and the Whigs made the veto an important issue of the presidential election of that year. They were beaten; Jackson was re-elected, receiving 219 electoral votes, and Clay, his Whig opponent, only 49, and the bank party could never again get a majority in the House of Representatives. But the President could not obtain a majority in the Senate. He determined to take a step which would give him an initiative, and which his opponents could not induce both houses to unite in overriding or punishing. Taking advantage of the provision that the secretary of the Treasury might order the public funds to be deposited elsewhere than in the bank or its branches, he directed the secretary to deposit *all* the public funds elsewhere. Thus deprived of its great source of dividends, the bank fell into difficulties, became a State bank after 1836, and then went into bankruptcy.

All the political conflicts of Jackson's terms of office were close and bitter. Loose in his ideas before 1829, Jackson showed a steady tendency to adopt the strictest construction of the powers of the Federal Government, except in such official perquisites as the offices. He grew into strong opposition to all traces of the "American system," and vetoed bills for internal improvements unsparingly; his feeling of dislike to all forms of protection is as evident, though he took more care not to make it too public.

Nullification. Calhoun and Jackson.—Calhoun and Jackson were of the same stock—Scottish-Irish—much alike in appearance and characteristics, Calhoun representing the trained and educated logic of the race, Jackson its instincts and passions. Jackson was led to break off his friendly relations with Calhoun in 1830, and he had been led to do so more easily because of the appearance of the doctrine of nullification which was generally attributed, correctly enough, to Calhoun. Asserting, as the Republican Party of 1798 had done, the sovereign powers of each State, Calhoun held that, as a means of avoiding secession and violent struggle upon every occasion of the passage of an act of Congress which should seem unconstitutional to any State, the State might properly suspend or "nullify" the operation of the law within its jurisdiction. The passage of the tariff act of 1832, which organized and systematized the protective system, forced his party into action. A State convention in South Carolina on Nov. 24, 1832, declared the tariff act null, and made ready to enforce the declaration.

But the time was past when the power of a single State could withdraw it from the Union. The President issued a proclamation, warning the people of South Carolina against any attempt to carry out the ordinance of nullification; he ordered a naval force to take possession of Charleston Harbour to collect the duties under the act; he called upon Congress for additional executive powers, and Congress passed what nullifiers called the "bloody bill," putting the land and naval forces at the disposal of the president; and he is said to have announced, privately and profanely, his intention of making Calhoun the first victim of any open conflict. Affairs looked so threatening that an unofficial meeting of "leading nullifiers" agreed to suspend the operation of the ordinance until Congress should adjourn; whence it derived the right to suspend has never been stated.

Tariff of 1833.—The President had already asked Congress to reduce the duties; and many Democratic members of Congress, who had yielded to the popular clamour for protection, were very glad to use "the crisis" as an excuse for now voting against it. A compromise tariff act, scaling down all duties over 20% by one-tenth of the excess every two years until 1842, when the remaining excess over 20% should be dropped, was introduced by Clay and became law. Calhoun and his followers claimed this as all that the nullification ordinance had aimed at; and the ordinance was formally repealed. But nullification had received its death-blow, even those southern leaders who maintained the right of secession refused to recognize the right of a State to remain in the Union while nullifying its laws.

Railways.—All the internal conditions of the United States were completely altered by the introduction of railways. For 20

years past the Americans had been pushing in every direction which offered a hope of the means of reconciling vast territory with enormous population. Stephenson's invention of the locomotive came just in time, and Jackson's two terms of office marked the outburst of modern American life. The miles of railway were 23 in 1830, 1,098 in 1835, some 2,800 in 1840, and thereafter they about doubled every five years until 1860.

A railway map of 1840 shows a fragmentary system, designed mainly to fill the gaps left by the means of communication in use in 1830. One or two short lines run back into the country from Savannah and Charleston; another runs north along the coast from Wilmington to Baltimore; several lines connect New York with Washington and other points; and short lines elsewhere mark the openings which needed to be filled at once—a number in New England and the Middle States, three in Ohio and Michigan, and three in Louisiana. Year after year new inventions came in to increase and aid this development. The anthracite coal of the Middle States was now successfully applied to railways (1836), and to the manufacture of iron (1837). Steam navigation across the Atlantic was established in 1838. The telegraph came next, S. F. B. Morse's line being erected in 1844. No similar period in American history of the 19th century is so extraordinary for material development as the decade 1830–40. At its beginning the country was an overgrown type of colonial life; at its end American life had been shifted to entirely new lines, which it has since followed.

Western Settlements.—The steamboat had aided western development, but the railway aided it far more. The steamboat influenced the railway, and the railway gave the steamboat new powers. Vacant places in the States east of the Mississippi were filling up; the long lines of emigrant wagons gave way to the new and better methods of transport. Chicago was but a frontier fort in 1832; within a half-dozen years it was a flourishing town, with eight steamers connecting it with Buffalo, with dawning ideas of its future development of railway connections. Two new States, Arkansas and Michigan, were admitted (1836 and 1837). The population of Ohio grew from 900,000 to 1,500,000, that of Michigan from 32,000 to 212,000, and that of the country from 13,000,000 to 17,000,000, between 1830 and 1840.

Social Conditions.—With the change of material surroundings and possibilities came a steady amelioration of social conditions and a development of social ideals. Such features of the past as imprisonment for debt and the cruel indifference of old methods of dealing with crime began to disappear; the time was past when a State could use an abandoned copper mine as its State prison, as Connecticut had formerly done. The domestic use of gas and anthracite coal, the introduction of expensive aqueducts for pure water, and the changing life of the people forced changes in the interior and exterior of American dwellings. Wood was still the common building material; imitations of Greek architecture still retained their vogue; but the interiors were models of comfort in comparison with the houses even of 1810. In the "new" regions this was not yet the case, and here social restraints were still so few that society seemed to be reduced almost to its primitive elements. Western steamers reeked with gambling, swindling, duelling and every variety of vice. Public law was almost suspended in some regions; and organized associations of counterfeiters and horse-thieves terrorized whole sections of the country. But this state of affairs was altogether temporary, as well as limited in its area; the older and more densely settled States had been well prepared for the change and had never lost command of the social forces, and the process of settling down went on, even in the newer States, with far more rapidity than could have been expected.

Literature.—A distinct American literature dates from this period. Most of the publications in the United States were still cheap reprints of foreign works; but native productions no longer followed foreign models with servility. Between 1830 and 1840 Whittier, Longfellow, Holmes, Poe, Hawthorne, Emerson, Bancroft and Prescott joined the advance-guard of American writers —Bryant, Dana, Halleck, Drake, Irving and Cooper; and even those writers who had already made their place in literature showed the influence of new conditions by their growing tendency to look less to foreign models and methods. Popular education was improved. The new States had from the first endeavoured to secure the best possible system of common schools. The attempt came naturally from the political instincts of the class from which the migration came; but the system which resulted was to be of incalculable service during the years to come. Their absolute democracy and their universal use of the English language have made the common schools most successful machines for converting the raw material of immigration into American citizens. This supreme benefit is the basis of the system and the reason for its existence and development, but its incidental advantage of educating the people has been beyond calculation. It was an odd symptom of the general change that American newspapers took a new form during these ten years. The old "blanket-sheet" newspaper, cumbrous to handle and slow in all its ways, met its first rival in the type of newspaper which appeared first in New York city, in the *Sun*, the *Herald* and the *Tribune* (1833, 1835 and 1841). Swift and energetic in gathering news, and fearless, sometimes reckless, in stating it, they brought into American life, with very much that is evil, a great preponderance of good.

Speculation.—The chaos into which a part of American society had been thrown had a marked effect on the financial institutions of the country, which went to pieces before it for a time. It had not been meant to make the public lands of the United States a source of revenue so much as a source of development. The sales had touched their high-water mark during the speculative year 1819, when receipts from them had amounted to $3,274,000; in other years they seldom went above $2,000,000. When the railway set the stream of migration moving faster than ever, and cities began to grow like mushrooms, it was natural that speculation in land should feel the effects. Sales rose to $3,200,000 in 1831, and to $25,000,000 in 1836. In 1835 the President announced to Congress that the public debt was extinguished, and that some way of dealing with the surplus should be found. Calhoun's proposal, that after the year 1836 any surplus in excess of $5,000,000 should be divided among the States as a loan, was adopted, as regards the surplus (almost $37,000,000) of that year; and some $28,000,000 were actually distributed before the crisis of 1837 put an end to the surplus and to the policy. The States had already taken a hand in the general speculation by beginning works of public improvement. Foreign, particularly English, capital was abundant; and States which had been accustomed to think a dozen times over a tax of $100,000 now began to negotiate loans of millions of dollars and to appropriate the proceeds to the digging of canals and the construction of railways. Their enterprises were badly conceived and badly managed. The imaginations of individuals ran riot. Every one wanted to buy; prices rose, and every one was growing richer on paper. The assessed value of real estate in New York city in 1832 was $104,000,000; in 1836 it had grown to $253,000,000. In Mobile the assessed value rose from $1,000,000 to $27,000,000.

When Jackson in 1833 ordered the Government revenues to be deposited elsewhere than in the Bank of the United States, there was no Government agent to receive them. The secretary of the Treasury selected banks at various points in which the revenue should be deposited by the collecting officers; but these banks were organized under charters from their States. The Democratic feeling was that the privilege of forming banking corporations should be open to all citizens, and it soon became so. Moreover, it was not until after the crash that New York began the system of compelling such deposits as would really secure circulation. In most of the States banks could be freely organized with or without tangible capital, and their notes could be sent to the West for the purchase of Government lands, which needed to be held but a month or two to gain a handsome profit. "Wild-cat banks" sprang up all over the country; and the "pet banks," as those chosen for the deposit of Government revenues were called, went into speculation as eagerly as the banks which hardly pretended to have capital.

Panic of 1837.—The Democratic theory denied the power of Congress to make anything but gold or silver coin legal tender. There have been "paper-money heresies" in the party; but there was none such among the new school of Democratic leaders which came in in 1829; they were "hard-money men." In July 1836

Jackson's secretary of the Treasury ordered land agents to take nothing in payment for lands except gold or silver. In the following spring the full effects of the order became evident; they fell on the administration of Van Buren, Jackson's successor. Van Buren had been Jackson's secretary of State, the representative man of the new Democratic school, and it seemed to the Whigs poetic justice that he should bear the weight of his predecessor's errors. The "specie circular" turned the tide of paper back to the East, and when it was presented for payment most of the banks suspended specie payment. There was no longer a thought of buying; everyone wanted to sell; and prices ran down with a rapidity even more startling than that with which they had risen. Failures on a scale unprecedented in the United States made up the "panic of 1837." Many of the States had left their bonds in the hands of their agents, and, on the failure of the agents, found that the bonds had been hypothecated or disposed of, so that the States got no return from them except a debt which was to them enormous. Saddled suddenly with such a burden, and unable even to pay interest, some of the States "repudiated" their obligations; and repudiation was made successful by the fact that a State could not be sued except by its own consent. Even the U.S. Government felt the strain, for its revenues were locked up in suspended banks. A little more than a year after Congress had authorized the distribution of its surplus revenues among the States, Van Buren was forced to call it into special session to provide some relief for the Government itself.

The Sub-treasury.—Van Buren held manfully to the strictest construction of the powers of the Federal Government. He insisted that the panic would best right itself without Government interference, and, after a four years' struggle, he succeeded in making the "sub-treasury scheme" law (1840). It cut off all connection of the Government with banks, putting collecting and disbursing officers under bonds to hold money safely and to transfer it under orders from the Treasury, and restricting payments to or by the United States to gold and silver coin. Its passage had been preceded by another commercial crisis (1839), more limited in its field, but more discouraging to the people.

Election of 1840.—Van Buren's firmness was unpopular, and the Whig Party now adopted methods which were popular if somewhat demagogical. It nominated William H. Harrison in 1840; it contrasted his homely frontier virtues with Van Buren's "ostentatious indifference to the misfortunes of the people" and after the first of the modern "campaigns" of mass meetings and processions Harrison was elected, receiving 234 electoral votes and Van Buren only 60. He died only a month after his inauguration, and the vice-president, John Tyler, became President.

Tyler was of the extreme Calhoun school, which had shown some disposition to grant to Van Buren a support which it had refused to Jackson; and the Whigs had nominated Tyler to retain his faction with them. Now he was the nominal leader of the party, while his politics were opposite to theirs, and the real leader of the party, Clay, was ready to force a quarrel upon him. The quarrel took place; the Whig majority in Congress was not large enough to pass any measures over Tyler's veto; and the first two years of his administration were passed in barren conflict with his party. The "sub-treasury" law was repealed (1841); the tariff of 1842 introduced a modified protection; and there the Whigs were forced to stop. Their dissensions made Democratic success comparatively easy. The success of the Democratic machinery, and the reflex of its temporary check in 1840, with the influences brought to bear on it by the returning Calhoun faction, were such as to take the control of the party out of the hands of the leaders who had formed it. They had had high regard for political principle, even though they were willing to use doubtful methods for its propagation; these methods had now brought out new men, who looked mainly to success, and to close connection with the controlling political element of the South as the easiest means of attaining success. When the Democratic convention of 1844 met it was expected to renominate Van Buren, but James K. Polk was nominated. The Whigs nominated Clay.

Abolitionist Movement.—The beginning of the abolitionist movement in the United States, the establishment of the *Liberator* (1831), and of the American Anti-slavery Society (1833), and the subsequent divisions in it, are dealt with elsewhere (*see* GARRISON, WILLIAM LLOYD). Up to that time "abolition" had meant *gradual* abolition; Garrison called for *immediate* abolition. The basis of the American system was in the reserved rights of the States, and slavery rested on their will. The mission of the Abolitionists was to force the people to think of the question; and, in spite of riots, assaults and persecution of every kind, they fulfilled it manfully. In truth, slavery was more and more out of harmony with the new economic conditions which were taking complete control of the North and West, but had hardly been felt in the South. Thus the two sections, North and South, were more and more disposed to take opposite views of everything in which slavery was involved, and it had a faculty of involving itself in almost everything. The status of slavery in the Territories had been settled in 1820; that of slavery in the States had been settled by the Constitution; but even in minor questions the intrusive element had to be reckoned with. The Abolitionists sent their documents through the mails, and the South wished the Federal Government to stop the practice. The Abolitionists persisted in petitioning Congress for the passage of various measures which Congress regarded as utterly unconstitutional; and the disposition of Congress to deny or regulate the right of petition in such matters excited the indignation of Northern men who had no sympathy with abolition. But the first occasion on which the views of the two sections came into flat contrast was on the question of the annexation of Texas.

Texas and Oregon.—The United States had had a vague claim to Texas until 1819, when the claim was surrendered to Spain in part compensation for Florida. On the revolt of Mexico, Texas became a part of that republic. It was colonized by Americans, mainly southerners and slave-holders, seceded from Mexico in 1835, and defeated the Mexican armies and established its independence in the following year. Southern politicians desired its annexation to the United States. People in the North were either indifferent or hostile to the proposal; Van Buren had declared against it, and his action was a reason for his defeat in the Democratic convention. On the other hand, there were indications that the joint occupation of the Oregon country could not last much longer. American immigration into it had begun, while the Hudson's Bay Company, the British tenant of the soil was the natural enemy of immigration. The two points were coupled; and the Democratic convention declared for the reannexation of Texas and the reoccupation of Oregon.

Election of 1844.—One of the cardinal methods of the political Abolitionists was to nominate candidates of their own against a doubtful friend, even though this secured the election of an open enemy. Clay's efforts to guard his condemnation of the Texas annexation project were just enough to push the Liberty party, the political Abolitionists, into voting for candidates of their own in New York; on a close vote their loss was enough to throw the electoral votes of that State to Polk, and its votes decided the result. Polk was elected (Nov. 1844); and Texas was annexed to the United States in the following spring. At the next meeting of Congress (1845) Texas was admitted as a State.

West of Texas the northern prolongation of Mexico ran right athwart the westward movement of American population; and though the movement had not yet reached the barrier the Polk Administration desired further acquisitions from Mexico. The western boundary of Texas was undefined; a strip of territory claimed by Texas was settled exclusively by Mexicans; but the Polk Administration directed Gen. Zachary Taylor, the American commander in Texas, to cross the Nueces river and seize the disputed territory. Collisions with Mexican troops followed; they were beaten in the battles of Palo Alto and Resaca de la Palma, and were chased across the Rio Grande. Taylor followed and took the city of Monterrey.

War with Mexico.—On the news of the first bloodshed, Congress declared war against Mexico, over the opposition of the Whigs. A land and naval force took possession of California, and a land expedition occupied New Mexico, so that the authority of Mexico over all the soil north of her present boundaries was

abruptly terminated (1846). At the opening of 1847 Taylor fought the last battle in northern Mexico (Buena Vista), defeating the Mexicans, and Gen. Winfield Scott, with a new army, landed at Vera Cruz for a march upon the City of Mexico. Scott's march was marked by one successful battle after another, usually against heavy odds; and in September he took the capital city and held it until peace was made (1848) by the Treaty of Guadalupe Hidalgo. Among the terms of peace was the cession of the present California, Utah, Arizona and New Mexico, the consideration being a payment of $15,000,000 by the United States and the assumption of some $3,000,000 of debts due by Mexico to American citizens. With a subsequent rectification of frontier (1853) by the Gadsden Treaty (*see* GADSDEN, JAMES), this cession added some 500,000sq.m. to the area of the United States; Texas itself made up a large additional area. The settlement of the north-east and north-west boundaries by the Webster-Ashburton and Buchanan-Pakenham treaties (1842, 1846) with the Texas and Mexican cessions, gave the United States the complete territorial form retained until the annexation of Alaska in 1867.

Slavery in the New Territory.—In the new territory slavery had been forbidden under Mexican law; and its annexation brought up the question of its status under American law. If slavery was to be excluded from the new territory, the States which should ultimately be formed out of it would enter as free States, and the influence of the South in the Senate would be decreased. For the first time the South appears as a distinct *imperium in imperio*.

"Squatter Sovereignty."—The first appearance of these difficulties brought out in the Democratic Party a solution which was so closely in line with the prejudices of the party that it bade fair to carry the party through the crisis without the loss of its Southern vote. This was "squatter sovereignty," the notion that it would be best for Congress to leave the people of each Territory to settle the question of the existence of slavery for themselves. The broader and democratic ground for the party would have been that which it at first seemed likely to take—the "Wilmot Proviso," a condition proposed to be added to the act authorizing acquisitions of territory, providing that slavery should be forbidden in all territory to be acquired under the act. In the end apparent expediency carried the dominant party off to "squatter sovereignty," and the Democratic adherents of the Wilmot Proviso, with the Liberty Party and the anti-slavery Whigs, united in 1848 under the name of the Free Soil Party. The Whigs had no solution to offer; their entire programme consisted in a persistent effort to evade or ignore all difficulties connected with slavery.

Election of 1848.—Taylor, after the battle of Buena Vista, resigned and came home, considering himself ill-used by the Administration. He refused to commit himself to any party; and the Whigs were forced to accept him as their candidate in 1848. The Democrats nominated Lewis Cass; the "Free-Soilers" nominated Van Buren. Taylor was elected President, receiving 163 electoral votes, while Cass received 127. Taking office in March 1849, he had on his shoulders the whole burden of the territorial difficulties, aggravated by the discovery of gold in California and the sudden rise of population there. Congress was so split into factions that it could for a long time agree upon nothing; and the Californians, with the approval of the President, proceeded to form a Constitution and apply for admission as a State. They had so framed their Constitution as to forbid slavery; and this was really the application of the Wilmot Proviso to the richest part of the new territory, and the South felt that it had been robbed of the cream of what it alone had fought cheerfully to obtain.

Compromise of 1850.—The admission of California was not secured until Sept. 1850, soon after Taylor's sudden death (July 9), and then only by the addition of a bonus to Texas, the division of the rest of the Mexican cession into the Territories of Utah and New Mexico without prohibition of slavery, and the passage of a fugitive slave law. The slave trade, but not slavery, was forbidden in the District of Columbia. The whole was generally known as the Compromise Measures of 1850. Two of its features need notice. As has been said, slavery was not mentioned in the act; and the status of slavery in the Territories was thus left uncertain. Congress can veto any legislation of a Territorial legislature but, in fact, the two houses of Congress were hardly ever able to unite on anything after 1850, and both these Territories did establish slavery before 1860, without a congressional veto. The advantage here was with the South. The other point, the fugitive slave law was a special demand of the South. The Constitution contained clauses directing that fugitive criminals and slaves should be delivered up, on requisition, by the State to which they had fled. In the case of criminals the delivery was directed to be made by the executive of the State to which they had fled; in the case of slaves no delivering authority was specified, and an act of Congress in 1793 had imposed the duty on Federal judges or on local State magistrates. Some of the States had passed "personal liberty laws," forbidding or limiting the action of their magistrates in such cases, and the act of 1850 transferred the decision of such cases to United States commissioners, with the assistance of United States marshals.

Tariff of 1846.—The question of slavery had taken up so much time in Congress that its other legislation was comparatively limited. The rates of postage were reduced to five and ten cents for distances less and greater than 300m. (1845); and the naval school at Annapolis was established in the same year. The military academy at West Point had been established as such in 1802. When the Democratic Party had obtained complete control of the Government, it re-established (by act of Aug. 6, 1846), the "subtreasury," or independent Treasury. In the same year, a tariff bill was passed; it reduced duties, and moderated the application of the protective principle. Apart from a slight reduction of duties in 1857, this remained in force till 1861.

New States.—Five States were admitted during the last ten years of this period: Florida (1845), Texas (1845), Iowa (1846), Wisconsin (1848) and California (1850). The early entrance of Iowa, Wisconsin and Florida had been due largely to Indian wars, after each of which the defeated Indians were compelled to cede lands. The extinction of Indian titles in northern Michigan brought about the discovery of the great copper fields of that region. Elsewhere settlement followed the lines already marked out, except in the new possessions on the Pacific coast, whose full possibilities were not yet known. Railways in the Eastern States were beginning to show something of a connected system; in the South they had hardly changed since 1840; in the West they had been prolonged only on their original lines. The telegraph was brought into use in 1844; but it was not until the census of 1860 that its effects were seen in the fully connected network of railways which then covered the whole North and West.

Invention.—The sudden development of wealth in the country gave an impetus to the spirit of invention. Charles Goodyear's method of vulcanizing rubber (1839) had come into use. Cyrus Hall McCormick had made an invention the results of which have been hardly less than that of the locomotive in their importance to the United States. He had patented a reaping machine in 1834, and this, further improved and supplemented by other inventions, had brought into play the whole system of agricultural machinery. A successful sewing-machine came in 1846; the power-loom and the surgical use of anaesthetics in the same year; and the rotary press for printing in 1847.

The Mormons.—All the conditions of life were changing so rapidly it was natural that the minds of men should change with them. This was the era of new sects, of communities, of transcendentalism in literature, religion and politics. The most successful of these was the sect of Mormons. They settled in Utah in 1847, calling their capital Salt Lake City, and spread through the neighbouring Territories. They became a menace to the American system; their numbers were so great that it was against American instincts to deprive them of self-government; while their polygamy and total submission to their hierarchy made it impossible to erect them into a State having complete control of marriage and divorce. The difficulty was lessened by their renunciation of polygamy in 1890.

The South.—The material development of the United States since 1830 had been extraordinary, but every year made it more evident that the South was not sharing in it. It is plain now that

the fault was in her labour system: her only labourers were slaves, and a slave who was fit for anything better than field labour was *prima facie* a dangerous man. The divergence had as yet gone only far enough to awaken intelligent men in the South to its existence, and to stir them to efforts as hopeless as they were earnest, to find some artificial stimulus for Southern industries. In the next ten years the process was to show its effects on the national field.

Slavery had put the South out of harmony with its surroundings. Even in 1850, though they hardly yet were aware of it, the two sections had drifted so far apart that they were practically two different countries.

The Slave Power.—The South remained much as in 1790; while other parts of the country had developed, it had stood still. The remnants of colonial feeling, of class influence, which advancing democracy had wiped out elsewhere, retained their force here. The ruling class had to maintain a military control over the labouring class, and a class influence over the poorer whites. It had even secured in the Constitution provision for its political power in the representation given to three-fifths of the slaves. The 20 additional members of the House of Representatives were not simply a gain to the South; they were still more a gain to the "black districts," where whites were few, and the slave-holder controlled the district. Slave-owners and slave-holders together, there were but 350,000 of them; but they had common interests, the intelligence to see them, and the courage to contend for them. The first step of a rising man was to buy slaves; and this was enough to enroll him in the dominant class. From it were drawn the representatives and senators in Congress, the governors and all the holders of offices over which the "slave power," as it came to be called, had control.

Immigration.—Immigration into the United States was not an important factor in its development till about 1847. The immigrants, so late as 1820, numbered but 8,000 per annum; their number did not touch 100,000 till 1842, and then it fell for a year or two almost to half that number. In 1847 it rose again to 235,000, in 1849 to 300,000, and in 1850 to 428,000; all told, more than 2,225,000 persons from abroad settled in the United States between 1847 and 1854. Leaving out the dregs of the immigration, which settled down in the seaboard cities, its best part was a powerful nationalizing force. It had not come to any particular State, but to the United States, yet all the influences of this enormous immigration were confined to the North and West; the immigration avoided slave soil as if by instinct. And as the sections began to differ further in aims and policy the North began to gain heavily in ability to ensure its success.

Congress.—Texas was the last slave State ever admitted; and, as it refused to be divided, the South had no further increase of numbers in the Senate. Until 1850 the admission of a free State had been so promptly balanced by the admission of a slave State that the senators of the two sections had remained about equal in number: in 1860 the free States had 36 senators and the slave States only 30. As the representation in the House had changed from 35 free State and 30 slave State members in 1790 to 147 free State and 90 slave State in 1860, and as the number of presidential electors is the sum of the numbers of senators and representatives, political power had passed away from the South in 1850. If at any time the free States should unite they would be supreme.

Tendencies to Disunion.—In circumstances so critical a cautious quiescence and avoidance of public attention was the only safe course for the "slave power," but that course had become impossible. The numbers interested had become too large to be subject to complete discipline; not all could be held in cautious reserve; and when an advanced proposal came from any quarter of the slave-holding lines the whole army was shortly forced up to the advanced position. If collision came it must be on some question of the rights of the States; and on such a question the whole South would move as one man.

The Protestant churches of the United States had reflected in their organization the spirit of the political institutions under which they lived. Acting as purely voluntary associations, they had been organized into governments by delegates, much like the "conventions" which had been evolved in the political parties. The omnipresent slavery question intruded into these bodies, and split them. Only the Episcopal and Roman Catholic Churches retained their national character.

Party Changes.—The political parties showed the same tendency. Each began to shrivel up in one section or the other. The notion of "squatter sovereignty," attractive at first to the Western democracy, and not repudiated by the South, enabled the Democratic Party to pass the crisis of 1850 without losing much of its Northern vote, while Southern Whigs began to drift in, making the party continually more pro-slavery. This could not continue long without beginning to decrease its Northern vote, but this effect did not become plainly visible until after 1852. The efforts of the Whig Party to ignore the great question alienated its anti-slavery members in the North, while they did not satisfy its Southern members. The Whig losses were not at first heavy, but, as the electoral vote of each State is determined by the barest plurality they were enough to defeat the party almost everywhere in the presidential election of 1852. The Whigs nominated Gen. Winfield Scott and the Democrats Franklin Pierce; Pierce carried all but four of the 31 States, and was elected, receiving 254 out of the 296 electoral votes. This revelation of hopeless weakness was the downfall of the Whig Party; it maintained its organization for four years longer, but the life had gone out of it. The future was with the Free Soil Party, though it had polled but few votes in 1852.

During the Administration of Taylor (and vice-president Millard Fillmore, who succeeded him) Clay, Webster, Calhoun, Polk and Taylor were removed by death, and there was a steady drift of other political leaders out of public life. New men were pushing in everywhere, and in both sections they showed the prevailing tendency to disunion. The best of them were unprecedentedly radical. Charles Sumner, William H. Seward and Salmon P. Chase came into the Senate, bringing the first accession of recognized force and ability to the anti-slavery feeling in that body. The new Southern men, such as Jefferson Davis, and the Democratic recruits from the Southern Whig Party, such as Alexander H. Stephens, were ready to take the ground on which Calhoun had always insisted—that Congress was bound not merely to the negative duty of not attacking slavery in the Territories, but to the positive duty of protecting it. This, if it should become the general Southern position, was certain to destroy the notion of "squatter sovereignty," and thus to split the Democratic Party, which was almost the last national ligament that now held the two fragments of the Union together.

Progress of Disunion.—The social disintegration was as rapid. Northern men travelling in the South were naturally looked upon with increasing suspicion, and were made to feel that they were on a soil alien in sympathies. Some of the worst phases of democracy were called into play in the South; and, in some sections, law openly yielded supremacy to popular passion in the cases of suspected Abolitionists. Southern conventions, on all sorts of subjects, became common; and, permeated by a dawning sense of Southern nationality, hardly any proposition looking to Southern independence of the North was met with disfavour.

Calhoun, in his last and greatest speech, called attention to the manner in which one tie after another was snapping. But he ignored the real peril of the situation—its dangerous facts: that the South was steadily growing weaker in comparison with the North, and more unable to secure a wider area for the slave system; that it was therefore being steadily forced into demanding active Congressional protection for slavery in the Territories; that the North would never submit to this; and that the South must submit or bring about a collision by attempting to secede.

Kansas-Nebraska Act.—Anti-slavery feeling in the North was stimulated by the manner in which the fugitive slave law was enforced immediately after 1850. The chase after fugitive slaves was prosecuted in many cases with circumstances of revolting brutality. The added feeling showed its force when the Kansas-Nebraska Act was passed by Congress (1854). It organized the two new Territories of Kansas and Nebraska. Both of them were

forever free soil by the terms of the Missouri Compromise. But the success of the notion of squatter sovereignty in holding the Democratic Party together while destroying the Whig Party had intoxicated Stephen A. Douglas and other Northern Democrats; and they now applied the doctrine to these Territories. They did not desire "to vote slavery up or down," but left the decision to the people of the two Territories.

The Republican Party.—The Kansas-Nebraska Act was the grossest political blunder in American history. The status of slavery had been settled, by the Constitution or by the compromises of 1820 and 1850, on every square foot of American soil; right or wrong, the settlement was made. The new act took a great mass of territory out of the settlement and flung it down as a prize for which the sections were to struggle. The first result of the act was to throw parties into chaos. An American or "Know-Nothing" Party, a secret oath-bound organization, pledged to oppose the influence or power of foreign-born citizens, had been formed to take the place of the defunct Whig Party. It had been quite successful in State elections for a time, and was now beginning to have larger aspirations. It, like the Whig Party, intended to ignore slavery, but, after a few years of life, the questions complicated with slavery divided it also. Even in 1854 many of its leaders in the North were forced to take position against the Kansas-Nebraska Act, while hosts of others joined in the opposition without any party organization. No American party ever rose so swiftly as this; with no other party name than the awkward title of "Anti-Nebraska men," it carried the congressional elections of 1854 in the North, forced many of the former Know-Nothing leaders into union with it, and controlled the House of Representatives of the Congress which met in 1855. The Democratic Party, which had been practically the only party since 1852, had now to face the latest and strongest of its broad-constructionist opponents. It acknowledged, at first, no purpose aimed at slavery, only an intention to exclude slavery from the Territories; but, under such principles, it was the only party which was potentially an anti-slavery party. The new party had grasped the function which belonged of right to its great opponent, and it seized with it its opponent's original title. The name Democrat had quite taken the place of that first used—Republican—but Republican had never passed out of popular remembrance and liking in the North. The new party took quick and skilful advantage of this by assuming the old name, and early in 1856 the two great parties of the present—Democratic and Republican—were drawn up against one another.

Foreign Relations.—The foreign relations during Pierce's term of office were overshadowed by the domestic difficulties, but were of importance. In the Koszta case (1853) national protection had been afforded on foreign soil to a person who had taken only the preliminary steps to naturalization. Japan had been opened to American intercourse and commerce (1854). But the question of slavery was more and more thrusting itself even into foreign relations. A great Southern republic, to be founded at first by the slave States, but to take in gradually the whole territory around the Gulf of Mexico and include the West Indies, was soon to be a pretty general ambition among slave-holders, and its first phases appeared during Pierce's administration. Efforts were begun to obtain Cuba from Spain; and the three leading American ministers abroad, meeting at Ostend, united in declaring the possession of Cuba to be essential to the well-being of the United States (1854). "Filibustering" expeditions against Cuba or the smaller South American States, intended so to revolutionize them as to lay a basis for an application to be annexed to the United States, became common. But these yielded in importance to the affairs in Kansas.

Kansas.—Nebraska was then supposed to be a desert, and attention was directed almost exclusively to Kansas. No sooner had its organization left the matter of slavery to be decided by its "people" than the anti-slavery people of the North and West felt it to be their duty to see that the "people" of the Territory should be anti-slavery in sympathy. Emigrant associations were formed, and these shipped men and families to Kansas, arming them for their protection in the new country. Southern newspapers called for similar measures in the South, but the call was less effective. Southern men without slaves, settling a new State, were uncomfortably apt to prohibit slavery, as in California. Only slave-holders were trusty pro-slavery men; and such were not likely to take slaves to Kansas and risk their ownership. But for the people of Missouri, Kansas would have been free soil at once. Lying across the direct road to Kansas, the Missouri settlers blockaded the way of free-State settlers, crossed into Kansas, and voted profusely at the first Territorial election. The struggle passed into a real civil war, the two powers fighting battles, capturing towns and paroling prisoners. The struggle was really over in 1857, and the South was beaten. There were, however, many obstacles yet to be overcome before the new State of Kansas was recognized by Congress, after the withdrawal of the senators of the seceding States (1861).

Election of 1856.—In the heat of the Kansas struggle came the presidential election of 1856. The Democrats nominated James Buchanan, declaring, as usual, for the strictest limitations of the powers of the Federal Government and reaffirming the principle of the Kansas-Nebraska act—the settlement of slavery by the people of a Territory. The remnant of the Whig Party, including the Know-Nothings of the North and those Southern men who wished no further discussion of slavery, nominated Millard Fillmore. The Republican Party nominated John C. Frémont; the bulk of its manifesto was taken up with protests against attempts to introduce slavery into the Territories; but it showed its broad-construction tendencies by declaring for appropriations of Federal moneys for internal improvements. The Democrats were successful in electing Buchanan; but the position of the party was quite different from the triumph with which it had come out of the election of 1852. It was no longer master of 27 of the 31 States; all the free States but five had gone against it; its candidate no longer had a majority of the popular vote. For the first time in the history of the country a distinctly anti-slavery candidate had obtained an electoral vote, and had even come near obtaining the Presidency. Fillmore had carried but one State, Maryland; Buchanan had carried the rest of the South, with a few States in the North, and Frémont the rest of the North and none of the South.

Dred Scott.—Oddly enough the constitutionality of the Compromise of 1820 had never happened to come before the Supreme Court for consideration. In 1856–57 it came up for the first time. One Dred Scott, a Missouri slave who had been taken in 1834 to Illinois, a free State, and in 1836 to Minnesota, within the territory covered by the compromise, and had some years after being taken back to Missouri in 1838 sued for his freedom, was sold (1852) to a citizen of New York. Scott then transferred his suit from the State to the Federal courts, under the power given them to try suits between citizens of different States, and the case came by appeal to the Supreme Court. Its decision, announced on March 6, 1857, put Scott out of court on the ground that a slave, or the descendant of slaves, could not be a citizen of the United States or have any standing in Federal courts. The opinion of Chief Justice Taney went on to attack the validity of the Missouri Compromise, for the reasons that one of the Constitutional functions of Congress was the protection of property, that slaves had been recognized as property by the Constitution, and that Congress was bound to protect, not to prohibit, slavery in the Territories. Most of the Northern people held that slaves were looked upon by the Constitution not as property but as "persons held to service or labour" by State laws. A large part of the North flouted the decision of the Supreme Court, and the storm of angry dissent which it aroused did the disunionists good service in the South. From this time the leading newspapers in the South maintained that the radical Southern view first advanced by Calhoun, and but slowly accepted by other Southern leaders, as to the duty of Congress to protect slavery in the Territories, had been confirmed by the Supreme Court; that the Northern Republicans had rejected it; even the "squatter sovereignty" of Northern Democrats could no longer be submitted to by the South.

John Brown.—The population of the United States in 1860

was over 31,000,000, an increase of more than 8,000,000 in ten years. As the decennial increases of population became larger, so did the divergence of the sections in population, and still more in wealth and resources. Two more free States came in during this period—Minnesota (1858) and Oregon (1859)—and Kansas was clamouring loudly for the same privilege. The free and slave States, which had been almost equal in population in 1790, stood now as 19 to 12. And of the 12,000,000 in slave States, the 4,000,000 slaves and the 250,000 free blacks were not so much a factor of strength as a possible source of weakness and danger. No serious slave rising had ever taken place in the South; but John Brown's attack (1859) on Harper's Ferry, as the first move in a project to rouse the slaves and the alarm which it carried through the South, were tokens of a danger which added a new horror to the chances of civil war.

Democratic Party Split.—Northern Democrats, under the lead of Douglas, had been forced already almost to the point of revolt by the determination of Southern senators to prevent the admission of Kansas as a free State, if not to secure her admission as a slave State. When the Democratic convention of 1860 met at Charleston the last strand of the last national political organization parted; the Democratic Party itself was split by the slavery question. The Southern delegates demanded a declaration in favour of the duty of Congress to protect slavery in the Territories. It was all that the Douglas Democrats could then do to maintain themselves in a few Northern States; such a declaration meant political suicide everywhere, and they voted it down. The convention divided into two bodies. The Southern body adjourned to Richmond, and the Northern and border State convention to Baltimore. Here the Northern delegates, by seating some delegates friendly to Douglas, provoked a further secession of border State delegates, who, in company with the Richmond body, nominated John C. Breckinridge and Joseph Lane for President and vice-president. The remainder of the original convention nominated Douglas and H. V. Johnson.

The remnant of the old Whig and Know-Nothing parties, now calling itself the Constitutional Union Party, met at Baltimore and nominated John Bell and Edward Everett. The Republican convention met at Chicago. Its "platform" of 1856 had been somewhat broad-constructionist but a strong Democratic element in the party had prevented it from going too far. The election of 1856 had shown that, with the votes of Pennsylvania and Illinois, the party would have then been successful, and the Democratic element was now ready to take almost anything which would secure the votes of these States. This state of affairs will go to explain the nomination of Abraham Lincoln, of Illinois, for President, with Hannibal Hamlin, a former Democrat, for vice-president, and the declaration of the platform in favour of a protective tariff. The mass of the platform was still devoted to the necessity of excluding slavery from the Territories.

Election of 1860.—No candidate received a majority of the popular vote, Lincoln standing first and Douglas second. But Lincoln and Hamlin had a clear majority of the electoral vote, and so were elected, Breckinridge and Lane coming next. It is worthy of mention that, up to the last hours of Lincoln's first term of office, Congress would always have contained a majority opposed to him but for the absence of the members from the seceding States. The interests of the South and even of slavery were thus safe enough under an anti-slavery president. But the drift of events was too plain. Nullification had come and gone, and the nation feared it no longer. Even secession by a single State was now almost out of the question; the letters of Southern governors in 1860, in consultation on the state of affairs, agree that no State would secede without assurances of support by others. If this crisis were allowed to slip by without action, even a sectional secession would soon be impossible.

Secession.—In Oct. 1860 Gov. W. H. Gist of South Carolina sent a letter to the governor of each of the other cotton States except Texas, asking co-operation in case South Carolina should resolve upon secession, and the replies were favourable. The democratic revolution which, since 1829, had compelled the legislature to give the choice of presidential electors to the people of the States had not affected South Carolina; her electors were still chosen by the legislature. That body, after having chosen the State's electors on Nov. 6, remained in session until the telegraph had brought assurances that Lincoln had been elected; it then (on the 10th) summoned a State convention and adjourned. The State convention on Dec. 20 unanimously passed an "ordinance of secession," repealing the acts by which the State had ratified the Constitution and its amendments, and dissolving "the union now subsisting between South Carolina and other states, under the name of the 'United States of America.'" The convention took all steps necessary to prepare for war, and adjourned. Similar ordinances were passed by conventions in Mississippi (Jan. 9, 1861), Florida (Jan. 10), Alabama (Jan. 11), Georgia (Jan. 19), Louisiana (Jan. 26) and Texas (Feb. 1).

The Confederate States.—The opposition in the South did not deny the right to secede, but the expediency of its exercise. Their effort was to elect delegates to the State conventions who would vote not to secede. They were beaten, says A. H. Stephens, by the cry, originally uttered by T. R. R. Cobb before his State legislature (Nov. 12, 1860), "We can make better terms out of the Union than in it." That is, the States were to withdraw individually, suspend the functions of the Federal government within their jurisdiction for the time, consider maturely any proposals for guarantees for their rights in the Union, and return as soon as satisfactory guarantees should be given. When the conventions of the seceding States had adopted the ordinances of secession, they proceeded to other business. They appointed delegates, who met at Montgomery, the capital of Alabama, formed a provisional Constitution (Feb. 8) for the "Confederate States," chose a provisional President and vice-president (Jefferson Davis and A. H. Stephens), and established an Army, Treasury, and other executive departments. The president and vice-president were inaugurated on Feb. 18. The permanent Constitution, adopted on March 11, was copied from that of the United States, with variations meant to maintain state Sovereignty, to give the Cabinet seats in Congress, and to prevent the grant of bounties or any protective features in the tariff or the maintenance of internal improvements at general expense; and it expressly provided that in all the territory belonging to the Confederacy but lying without the limits of the several States "the institution of negro slavery, as it now exists in the Confederate States, shall be recognized and protected by Congress and by the Territorial Government."

Under what claim of constitutional right all this was done passes comprehension. That a State convention should have the final power of decision on the question which it was summoned to consider is quite as radical doctrine as has yet been heard of; that a State convention, summoned to consider the one question of secession, should go on, with no appeal to any further popular authority or mandate, to send delegates to meet those of other States and form a new National Government, which could only exist by warring on the United States, is a novel feature in American constitutional law. It was revolution or nothing. Only in Texas, where the call of the State convention was so irregular that a popular vote could hardly be escaped, was any popular vote allowed. Elsewhere the functions of the voter ceased when he voted for delegates to the State convention.

The Border States.—The border States were in two tiers—North Carolina, Tennessee and Arkansas next to the seceding States, and Delaware, Maryland, Virginia, Kentucky and Missouri next to the free States. None of these was willing to secede. There was, however, one force which might draw them into secession. A State which did not wish to secede, but believed in State sovereignty and the abstract right of secession, would be inclined to take up arms to resist any attempt by the Federal Government to coerce a seceding State. In the following spring, the original seven seceding States were reinforced by four border States.

In the North and West surprisingly little attention was given to the systematic course of procedure along the Gulf. The people of those sections were very busy; they had heard much of this talk before, and looked upon it as a kind of stage thunder. Republican politicians, with the exception of a few, were inclined to refrain from public declarations of intention. Some of them such

as Seward, showed a disposition to let the "erring sisters" depart in peace, expecting to make the loss good by accessions from Canada. A few, like Senator Zachariah Chandler, believed that there would be "blood-letting," but most of them were still doubtful as to the future. In the North the leaders and the people generally shrank from the prospect of war. Among the various proposals to this end, that offered in the Senate by John J. Crittenden, of Kentucky, and known as the Crittenden compromise, was perhaps received with most favour. This took the form of six proposed amendments to the Constitution, of which two were virtually a re-phrasing of the essential feature of the Missouri Compromise and of the principle of squatter sovereignty, and others provided that the National Government should pay to the owner of any fugitive slave, whose return was prevented by opposition in the North, the full value of such slave, and prohibited the abolition of slavery in the District of Columbia "so long as it exists in the adjoining states of Virginia and Maryland or either." This proposed compromise was rejected by the Senate by a close vote on March 2, 1861. A peace congress, called by Virginia, met in Washington from Feb. 4 to 27, 1861, 21 States being represented, and proposed a constitutional amendment embodying changes very similar to those of the Crittenden compromise, but its proposal was not acted upon by Congress. Congress did nothing, except to admit Kansas as a free State and adopt the protective Morrill tariff; even after its members from the seceding States had withdrawn, those who remained made no preparations for conflict, and, at their adjournment in March 1861, left the Federal Government naked and helpless.

The War Governors.—The only sign of life in the body politic, the half-awakened word of warning from the Democracy of the North and West, was its choice of governors of States. A remarkable group of men, soon to be known as the "war governors"—Israel Washburn of Maine, Erastus Fairbanks of Vermont, Ichabod Goodwin of New Hampshire, John Albion Andrew of Massachusetts, William Sprague of Rhode Island, William Alfred Buckingham of Connecticut, Edwin Dennison Morgan of New York, Charles Smith Olden of New Jersey, Andrew Gregg Curtin of Pennsylvania, William Dennison of Ohio, Oliver Perry Morton of Indiana, Richard Yates of Illinois, Austin Blair of Michigan, Alexander Williams Randall of Wisconsin, Samuel Jordan Kirkwood of Iowa, and Alexander Ramsey of Minnesota —held the executive powers of the Northern States in 1861–62. Some of these governors, such as Andrew and Buckingham, as they saw the struggle come nearer, went so far as to order the purchase of warlike material for their States on their private responsibility, and their action saved days of time.

U.S. Property Seized.—The little Army of the United States had been almost put out of consideration; wherever its detachments could be found in the South they were surrounded and forced to surrender and were transferred to the North. After secession, and in some of the States even before it, the forts, arsenals, mints, custom-houses, shipyards and public property of the United States had been seized by authority of the State, and these were held until transferred to the new Confederate States organization.

Only a few forts, of all the magnificent structures with which the nation had dotted the Southern coast, remained to it—the forts near Key West, Fortress Monroe at the mouth of Chesapeake Bay, Ft. Pickens at Pensacola and Ft. Sumter in Charleston Harbour. Both the last-named were beleaguered by hostile batteries, but the Administration of President Buchanan, intent on maintaining the peace until the new Administration should come in, instructed their commanding officers to refrain from any acts tending to open conflict. The Federal officers, therefore, were obliged to look idly on while every preparation was made for their destruction, and even while a vessel bearing supplies for Ft. Sumter was driven back by the batteries between it and the sea.

The divergence between the two sections of the country had thus passed into disunion, and was soon to pass into open hostility. The legal recognition of the custom of slavery, acting upon and reacted upon by every step in their economic development and every difference in their natural characteristics and institutions, had carried North and South farther and faster apart, until the elements of a distinct nationality had appeared in the South.

Secession had taken away many of the men who had for years managed the Federal Government, and who understood its workings. Lincoln's party was in power for the first time; his officers were new to the routine of Federal Administration; and the circumstances with which they were called upon to deal were such as to daunt any spirit. The Government had become so nearly bankrupt in the closing days of Buchanan's Administration that it had escaped only by paying double interest. The Army had been almost broken up by captures of men and material and by resignations of competent and trusted officers. The Navy had come to such a pass that, in Feb. 1861, a House committee reported that only two vessels, one of 20, the other of two guns, were available for the defence of the entire Atlantic coast. And, to complicate all difficulties, a horde of clamorous office-seekers crowded Washington.

Civil War, 1861–65.—Soon after Lincoln's Administration began, the starting of an expedition to provision Ft. Sumter brought on an attack by the batteries around the fort, and after a bombardment of 36 hours the fort surrendered (April 14, 1861). It is not necessary to rehearse the familiar story of the outburst of feeling which followed this event and the proclamation of President Lincoln calling for volunteers. The 75,000 volunteers called for were supplied three or four times over.

There had been some belief in the South that the North-west would take no part in the impending conflict, and that its people could be persuaded to keep up friendly relations with the new nationality. In the spring months of 1861 Douglas, who had long been denounced as the tool of the Southern slave-holders, was spending the closing days of life in expressing the determination of the North-west that it would never submit to have "a line of custom-houses" between it and the ocean. The batteries which Confederate authority was erecting on the banks of the Mississippi were fuel to the flame. California, considered neutral by all parties, pronounced as unequivocally for the national authority.

The shock of arms put an end to opposition in the South as well. The peculiar isolation of life in the South precluded the more ignorant voter from any comparisons of the power of his State with any other; to him it was almost inconceivable that his State should own or have a superior. The better educated men, of wider experience, had been trained to think State sovereignty the foundation of civil liberty, and, when their State spoke, they felt bound to "follow their State." The president of the Confederate States issued his call for men, and it also was more than met.

The Border States.—Lincoln's call for troops met with an angry reception wherever the doctrine of State sovereignty had a foothold. The governors of the border States generally returned it with a refusal to furnish any troops. Two States, North Carolina and Arkansas, seceded and joined the Confederate States. In two others, Virginia and Tennessee, the State politicians formed "military leagues" with the Confederacy, allowing Confederate troops to take possession of the States and then submitted the question of secession to "popular vote." The secession of these States was thus accomplished, and Richmond became the Confederate capital. The same process was attempted in Missouri, but failed, and the State remained loyal. The politician class in Maryland and Kentucky took the extraordinary course of attempting to maintain neutrality; but the growing power of the Federal Government soon enabled the people of the two States to resume control of their governments and give consistent support to the Union. Kentucky, however, had troops in the Confederate armies; and one of her citizens, the late vice-president, John C. Breckinridge, left the Senate and became an officer in the Confederate service. Delaware cast her lot from the first with the Union.

Civil War.—The first blood of the war was shed in the streets of Baltimore, when a mob attempted to stop Massachusetts troops on their way to Washington (April 19). For a time there was difficulty in getting troops through Maryland because of the active hostility of a part of its people, but this was overcome, and the national capital was made secure. The Confederate lines had been pushed up to Manassas Junction, about 30m. from Washington. When Congress, called into special session by the President for

July 4, came together, the outline of the Confederate States had been fixed. The length of the line, including also the Atlantic and Gulf coasts, has been estimated at 11,000 miles. The territory within it comprised about 800,000sq.m., with a population of over 9,000,000 and great natural resources. Its cotton was almost essential to the manufactories of the world; in exchange for it every munition of war could be procured; and it was hardly possible to blockade a coast over 3,000m. in length, on which the blockading force had but one port of refuge, and that at about the middle of the line. Nevertheless, President Lincoln issued his first call for troops on April 15. President Davis then issued a proclamation (on the 17th) offering letters of marque and reprisal against the commerce of the United States to private vessels, and on the 19th Lincoln answered with a proclamation announcing the blockade of the Southern coast. The news brought out proclamations of neutrality from Great Britain and France.

The President found himself compelled to assume powers never granted to the executive authority, trusting to the subsequent action of Congress to validate his action. He had to raise and support armies and navies; he even had to authorize seizures of necessary property, of railroad and telegraph lines, arrests of suspected persons, and the suspension of the writ of *habeas corpus* in certain districts. Congress supported him, and proceeded in 1863 to give the President power to suspend the writ anywhere in the United States; this power he promptly exercised. The Supreme Court, after the war, in the Milligan case (4 Wallace, 133) decided that no branch of the Government had power to suspend the writ in districts where the courts were open—that the *privilege* of the writ might be suspended as to persons properly involved in the war, but that the writ was still to issue, the court deciding whether the person came within the classes to whom the suspension applied.

When Congress met (July 4, 1861) the absence of Southern members had made it heavily Republican. It decided to consider no business but that connected with the war, authorized a loan and the raising of 500,000 volunteers, and made confiscation of property a penalty of rebellion. While it was in session the first serious battle of the war—Bull Run, or Manassas—took place (July 21), and resulted in the defeat of the Federal Army.

The "Trent" Case.—The over-zealous action of a naval officer in taking the Confederate envoys James M. Mason and John Slidell out of the British steamer "Trent" sailing between two neutral ports almost brought about a collision between the United States and Great Britain in November. But the American precedents were all against the United States, and the envoys were given up.

The broad-construction tendencies of the Republican party showed themselves more plainly as the war grew more serious; there was an increasing disposition to cut every knot by legislation, with less regard to the constitutionality of the legislation. A paper currency commonly known as "greenbacks," was adopted and made legal tender (Feb. 25, 1862). Slavery was prohibited (April 16) in the District of Columbia and the Territories (June 19); the Army was forbidden to surrender escaped slaves to their owners; and slaves of insurgents were ordered to be confiscated. In addition to a homestead act giving public lands to actual settlers at reduced rates, Congress began a further development of the system of granting public lands to railways. Another important act (1862) granted public lands for the establishment of agricultural and mechanical colleges.

Railways.—The railway system of the United States was but 20 years old in 1850, but it had begun to assume some consistency. The day of short and disconnected lines had passed, and the connections which were to develop into railway systems had appeared. Consolidation of smaller companies had begun; the all-rail route across the State of New York was made up of more than a dozen original companies at its consolidation in 1853. The Erie railway, chartered in 1832, was completed from Piermont to Dunkirk (N.Y.), in 1851; and another line—the Pennsylvania—was completed from Harrisburg to Pittston (Pa.), in 1854. These were at least the germs of great trunk lines. The cost of American railways has been only from one-half to one-fourth of the cost of European railways; but an investment in a Far-western railway in 1850–60 was an extra-hazardous risk. Not only did social conditions make any form of business hazardous; the new railway often had to enter a territory bare of population, and there create its own towns, farms and traffic. Whether it could do so was so doubtful as to make additional inducements to capital necessary. The means attempted by Congress in 1850, in the case of the Illinois Central railroad, was to grant public lands to the corporation, reserving to the United States the alternate sections. At first grants were made to the States for the benefit of the corporations; the act of 1862 made the grant directly to the corporation.

The vital military and political necessity of an immediate railway connection with the Pacific coast was hardly open to doubt in 1862; but the necessity scarcely justified the terms which were offered and taken. The Union Pacific railroad was incorporated; the United States Government was to issue to it bonds, on the completion of each 40m., to the amount of $16,000 per mile, to be a first mortgage; through Utah and Nevada the aid was to be doubled, and for some 300m. of mountain building to be trebled; and, in addition to this, alternate sections of land were granted. The land-grant system, thus begun, was carried on extensively, the largest single grants being those of 47,000,000ac. to the Northern Pacific (1864) and of 42,000,000ac. to the Atlantic and Pacific line (1866).

Paper Prices.—Specie payments had been suspended almost everywhere towards the end of 1861; but the price of gold was but 102·5 at the beginning of 1862. About May its price in paper currency began to rise. It touched 170 during the next year, and 285 in 1864; but the real price probably never went much above 250. Other articles felt the influence in currency prices.

Tariff and Taxes.—The duties on imports were driven higher than the original Morrill tariff had ever contemplated. The average rates, which had been 18% on dutiable articles and 12% on the aggregate in 1860–61, rose, before the end of the war, to nearly 50% on dutiable articles and 35% on the aggregate. Domestic manufactures sprang into new life under such encouragement; everyone who had spare wealth converted it into manufacturing capital. The probability of such a result had been the means of getting votes for an increased tariff; free traders had voted for it as well as protectionists. For the tariff was only a means of getting capital into positions in which taxation could be applied to it, and the "internal revenue" taxation was merciless beyond precedent. The annual increase of wealth from capital was then about $550,000,000; the internal revenue taxation on it rose in 1866 to $310,000,000, or nearly 60%.

Bonds.—The stress of all this upon the poor must have been great, but it was relieved in part by the bond system on which the war was conducted. While the armies and navies were shooting off large blocks of the crops of 1880 or 1890, work and wages were abundant for all who were competent for them. It is true, then, that the poor paid most of the cost of the war; it is also true that the poor had shared in that anticipation of the future which had been forced on the country, and that, when the drafts on the future came to be redeemed, it was done mainly by taxation on luxuries. The destruction of a Northern railway meant more work for Northern iron mills and their workmen. The destruction of a Southern road was an unmitigated injury; it had to be made good at once, by paper issues; the South could make no drafts on the future, by bond issues, for the blockade had put cotton out of the game, and Southern bonds were hardly salable. Every expense had to be met by paper issues; each issue forced prices higher. *A Rebel War-Clerk's Diary* gives the following as the prices in the Richmond market for May 1864: 'Boot, $200; coats, $350; pantaloons, $100; shoes, $125; flour, $275 per barrel; meal, $60 to $80 per bushel; bacon, $9 per pound; no beef in market; chickens, $30 per pair; shad, $20; potatoes, $25 per bushel; turnip greens, $4 per peck; white beans, $4 per quart or $120 per bushel; butter, $15 per pound; wood, $50 per cord."

Manufactures.—The complete lack of manufactures told heavily against the South from the beginning. As men were drawn from agriculture in the North and West, the increased de-

mand for labour was shaded off into an increased demand for agricultural machinery; every increased percentage of power in reaping-machines liberated so many men for service at the front. The reaping-machines of the South—the slaves—were incapable of any such improvement and, besides, required the presence of a portion of the possible fighting men at home to watch them. But no insurrection took place.

The pressing need for men in the Army made the Confederate Congress utterly unable to withstand the growth of executive power. Its bills were prepared by the Cabinet, and the action of Congress was quite perfunctory. The suspension of the writ of *habeas corpus*, and the vast powers granted to President Davis, or assumed by him, made the Confederate Government almost a despotism. It was not until the closing months of the war that the expiring Confederate Congress mustered up courage enough to oppose the President's will.

Banking.—Another act of Federal legislation—the National Bank Act (Feb. 25, 1863; supplemented by the act of June 3, 1864)—should be mentioned here, as it was closely connected with the sale of bonds. The banks were to be organized and, on depositing United States bonds at Washington, were to be permitted to issue notes up to 90% of the value of the bonds deposited. As the redemption of the notes was thus assured, they circulated without question all over the United States. By a subsequent act (1865) the remaining State bank circulation was taxed out of existence.

West Virginia.—At the beginning of 1862 the lines of demarcation between the two powers had become plainly marked. The western part of Virginia had separated itself from the parent State, and was admitted as a State (1863) under the name of West Virginia. It was certain that Delaware, Maryland, Kentucky and Missouri had been saved to the Union, and that the battle was to be fought out in the territory to the south of them.

The Emancipation Proclamation.—At the beginning of the war the people and leaders of the North had not desired to interfere with slavery, but circumstances had been too strong for them. Lincoln had declared that he meant to save the Union as best he could—by preserving slavery, by destroying it or by destroying part and preserving part. Just after the battle of Antietam (Sept. 17, 1862) he issued his proclamation calling on the revolted States to return to their allegiance before the next year, otherwise their slaves would be declared free men. No State returned and the threatened declaration was issued on Jan. 1, 1863. As President, Lincoln could issue no such declaration; as commander-in-chief of the armies and navies of the United States he could issue directions only as to the territory within his lines; but the Emancipation Proclamation applied only to territory outside of his lines. It has therefore been debated whether the proclamation was in reality of any force. It may fairly be taken as an announcement of the policy which was to guide the Army and as a declaration of freedom taking effect as the lines advanced. At all events, this was its exact effect. Its international importance was far greater. The locking up of the world's source of cotton supply had been a general calamity, and the Confederate Government and people had steadily expected that the English and French Governments would intervene in the war. The conversion of the struggle into a crusade against slavery made intervention impossible.

Confederate Privateers.—Confederate agents in England were numerous and active. Taking advantage of every loophole in the British Foreign Enlistment Act, they built and sent to sea the "Alabama" and "Florida," which for a time almost drove Federal commerce from the ocean. Whenever they were closely pursued by United States vessels they took refuge in neutral ports until a safe opportunity occurred to put to sea again. Another, the "Georgia," was added in 1863. All three were destroyed in 1864. Confederate attempts to have iron-clads equipped in England and France were unsuccessful.

The Victory of the North.—The turning-point of the war was evidently in the early days of July 1863, when the victories of Vicksburg and Gettysburg came together. The National Government had at the beginning cut the Confederate States down to a much smaller area than might well have been expected; its armies had pushed the besieging lines far into the hostile territory; and the war itself had developed a class of generals who cared less for the conquest of territory than for destroying the opposing armies. The great drafts on the future which the credit of the Federal Government enabled the North to make gave it also a startling appearance of prosperity; so far from feeling the war, it was driving production of every kind to a higher pitch than ever before.

The war had not merely developed improved weapons and munitions of war; it had also spurred the people on to a more careful attention to the welfare of the soldiers, the fighting men drawn from their own number. The sanitary commission, the Christian commission, and other voluntary associations for the physical and moral care of soldiers, received and disbursed very large sums. The National Government was paying an average amount of $2,000,000 per day for the prosecution of the war and, in spite of the severest taxation, the debt grew to $500,000,000 in June 1862, to twice that amount a year later, to $1,700,000,000 in June 1864 and reached its maximum on Aug. 31, 1865 —$2,845,907,626. But this lavish expenditure was directed with energy and judgment. The blockading fleets were kept in perfect order and with every condition of success. The railway and telegraph were brought into systematic use for the first time in modern warfare. Late in 1863 Edwin M. Stanton, the secretary of War, moved two corps of 23,000 men from Washington to Chattanooga, 1,200m., in seven days.

Conscription.—On the other hand, the Federal Armies now held almost all the great southern through lines of railway, except the Georgia lines and those which supplied Lee from the South. The want of the Southern people was merely growing in degree, not in kind. The conscription, sweeping from the first, had become omnivorous; towards the end of the war every man between 17 and 55 was legally liable to service, and in practice the only limit was physical incapacity. In 1863 the Federal Government also was driven to conscription. The first attempts to carry it out resulted in forcible resistance in several places, the worst being the "draft riots" in New York (July), when the city was in the hands of the mob for several days. All the resistance was put down; but exemptions and substitute purchases were so freely permitted that the draft in the North had little effect except as a stimulus to the States in filling their quotas of volunteers by voting bounties.

Election of 1864.—In 1864 Lincoln was re-elected with Andrew Johnson as vice-president. The Democratic convention had declared that, after four years of failure to restore the Union by war, during which the Constitution had been violated in all its parts under the plea of military necessity, a cessation of hostilities ought to be obtained, and had nominated Gen. George B. McClellan and G. H. Pendleton. Farragut's victory in Mobile Bay (Aug. 5), by which he sealed up the last port, except Wilmington, of the blockade-runners, and the evidently staggering condition of the Confederate resistance in the East and the West, were the sharpest commentaries on the Democratic platform; its candidates carried only three of the 25 states taking part in the election. The 36th State—Nevada—had been admitted in 1864.

Surrender of Lee.—The actual fighting of the war ended with the surrender of Gen. Robert E. Lee to Gen. U.S. Grant at Appomattox, Va., April 9, 1865. All the terms of surrender named by Grant were generous: no private property was to be surrendered; both officers and men were to be dismissed on parole, not to be disturbed by the United States Government so long as they preserved their parole and did not violate the laws; and he instructed the officers appointed to receive the paroles "to let all the men who claim to own a horse or mule take the animals home with them to work their little farms." Gen. Joseph E. Johnston, with the only other considerable army in the field, surrendered on much the same terms at Durham Station, N.C. (April 26), after an unsuccessful effort at a broader settlement. All organized resistance had now ceased; Union cavalry were ranging the South, picking up Government property or arresting leaders; but it was not until May that the last detached parties

of Confederates gave up the contest.

Death of Lincoln.—Just after Lee's surrender President Lincoln died by assassination (April 15), the crime of a half-crazed enthusiast. Even this event did not impel the U.S. people to any vindictive use of their success for the punishment of individuals. In the heat of the war, in 1862, congress had so changed the criminal law that the punishment of treason and rebellion should no longer be death alone, but death or fine and imprisonment. Even this modified punishment was not inflicted. There was no hanging; some of the leaders were imprisoned for a time, but never brought to trial.

The Armies.—The Armies of the Confederacy are supposed to have been at their strongest (700,000) at the beginning of 1863; and it is doubtful whether they contained 200,000 men in March 1865. The dissatisfaction of the southern people at the manner in which Davis had managed the war seems to have been profound; and it was converted into hero worship only by the ill-advised action of the federal government in arresting and imprisoning him. Desertion had become so common in 1864, and the attempts of the Confederate government to force the people into the ranks had become so arbitrary, that the bottom of the Confederacy had dropped out of it before Sherman moved northward from Savannah, Ga. On the contrary, the numbers of the Federal armies increased steadily until March 1865, when they were a few hundreds more than 1,000,000. As soon as organized resistance ceased, the disbanding of the men began; they were sent home at the rate of about 300,000 a month, about 50,000 being retained in service as a standing army.

Cost of the War.—The direct cost of the Civil War has been variously estimated, the best estimate including the first three years of reconstruction being $5,000,000,000 to the North and $3,000,000,000 to the South. But if pensions, interest and other such items up to 1910 are included, the result is a total of between $11,000,000,000 and $12,000,000,000 for the North alone. But the cost to the South also was enormous; $4,000,000,000 cannot be an exaggeration. (A. J.; X.)

FROM 1865 TO 1910

The capitulation of Lee (April 9, 1865), followed by the assassination of Lincoln (April 15) and the surrender of the last important Confederate army, under J. E. Johnston, marked the end of the era of war and the beginning of that of reconstruction, which involved a revolution in the social and political structure of the South, in the relation of state and nation in the American federal union, and in the economic life of the whole country.

Condition of the South.—Economically the condition of the

South was desperate. The means of transport were destroyed; railways and bridges were ruined; Southern securities were valueless; the Confederate currency system was completely disorganized. Emancipated negroes wandered idly from place to place, trusting the Union armies for sustenance, while their former masters toiled in the fields to restore their plantations.

The social organization of the South had been based on negro slavery. Speaking generally, the large planters had constituted the dominant class, especially in the cotton States; and in the areas of heaviest negro population these planters had belonged for the most part to the old Whig Party. Outside of the larger plantation areas, especially in the hill regions and the pine barrens, there was a population of small planters and poor whites who belonged in general to the Democratic Party. In the mountain regions, where slavery had hardly existed, there were Union areas, and from the poor whites of this section had come Andrew Johnson, senator and war governor of Tennessee, who was chosen vice-president on the Union ticket with Lincoln in 1864 as a recognition of the Union men of the South.

The North.—The importance of personality in history was clearly illustrated when the wise and sympathetic Lincoln, who had the confidence of the masses of the victorious North, was replaced by Johnson, opinionated and intemperate, whose antecedents as a Tennessean and Democrat, and whose State rights principles and indifference to Northern ideals of the future of the negro made him distrusted by large numbers of the Union Republican Party.

The composition of this party was certain to endanger its stability when peace came. It had carried on the war by a coalescence of Republicans, War Democrats, Whigs, Constitutional Unionists and Native Americans, who had rallied to the cause of national unity. At the outset it had asserted that its purpose was not to interfere with the established institutions in slave States, but to defend the Constitution, and to preserve the Union. But the war had destroyed slavery, as well as preserved the Union, and the civil status of the negro and the position of the revolted States now became burning questions. To the extremists of the Radical wing it seemed in accordance with the principles of human liberty that the negro should not only be released from slavery but should also receive full civil rights, including the right to vote. This group was also ready to revolutionize Southern society by destroying the old ascendancy of the great planter-class.

For many years before the war, parties had differed on such important questions as the tariff, internal improvements and foreign policy; and the South had used its alliance with the Northern Democracy to resist the economic demands of the industrial interests of the North. A return of Southern congressmen might mean a revival of the old political situation, with the South and the Northern Democracy once more in the saddle.

Attitude of the Two Sections.—Any attempt to restore the South to full rights, therefore, without further provision for securing for the freedmen the reality of their freedom, and without some means of establishing the political control of the victorious party, would create party dissension. Even Lincoln had aroused the bitter opposition of the radical leaders by his generous plan of reconstruction. Johnson could have secured party support only by important concessions to the powerful leaders in Congress; and these concessions he was temperamentally unable to make. The masses of the North, especially in the first rejoicings over the peace, were not ungenerous in their attitude; and the South as a whole, accepted the results of defeat in so far as to acquiesce in the permanence of the Union and the emancipation of the slaves, the original issues of the war.

Reconstruction.—In the settlement of the details of reconstruction, however, there were abundant opportunities for the hatred engendered by the war to flame up once more. As it became clear that the Northern majority was determined to exclude the leaders of the South from political rights in the reconstruction of the Union, and especially as the radicals disclosed their purpose to ensure Republican ascendancy by subjecting the section to the rule of the loyalist whites and, later to that of the emancipated negroes, good will disappeared, and the South entered upon a fight for its social system. The natural leaders of the people, men of intelligence and property, had been the leaders of the section in the war. Whatever their views had been at first as to secession, the great majority of the Southern people had followed the fortunes of their States. To disfranchise their leaders was to throw the control into the hands of a less able and small minority of whites; to enfranchise the blacks while disfranchising the white leaders was to undertake the task of subordinating the former political people of a section to a different race, just released from slavery, ignorant, untrained and without property.

These underlying forces were in reality more influential than the constitutional theories which engaged so much of the discussion in Congress, theories which, while they afford evidence of the characteristic desire to proceed constitutionally were really urged in support of, or opposition to, the interests just named.

The most extreme Northern Democrats, and their Southern sympathizers, starting from the premise that constitutionally the Southern States had never been out of the Union, contended that the termination of hostilities restored them to their former rights in the Federal Union unimpaired and without further action. This theory derived support from President Lincoln's view that not States, but assemblages of individuals, had waged war against the Government. The theory of the extreme Republican Radicals was formulated by Sumner and Stevens. Sumner contended that, while the States could not secede, they had by waging war reduced themselves to mere Territories, entitled only to the rights of Territories. Stevens, appealing to the facts of secession, declared the Southern States conquered provinces, subject to be disposed of at the will of the conqueror. In the end Congress adopted a middle ground, holding that while the States could not leave the Union, they were, in fact, out of normal relations, and that the constitutional right of the Federal Government to guarantee republican Governments to the various States gave to Congress the power to impose conditions precedent to their rehabilitation.

It is necessary to recall the initiation of reconstruction measures by President Lincoln rightly to understand the position which was taken by President Johnson. Impatient of theoretical discussion, Lincoln laid down practical conditions of restoration in his proclamation of Dec. 8, 1863. In this he offered amnesty to those who would take an oath of loyalty for the future and accept the acts of Congress and the proclamation of the President with reference to slaves. From the amnesty he excepted the higher military, civil and diplomatic officers of the Confederacy as well as those who had relinquished judicial stations, seats in Congress, or commissions in the Army or Navy and those who had treated persons in the Federal service otherwise than lawfully as prisoners of war. The proclamation provided, further, that when in any of the seceding States (except Virginia, where the President had already recognized the loyal Government under Gov. Francis H. Pierpont) a number of persons not less than one-tenth of the voters in 1860 should have taken the above described oath, and, being qualified voters under the laws of the State in 1860, should have established a State Government, republican in form, it should be recognized.

The First Reconstruction Bill.—Although Lincoln expressly pointed out that the admission of the restored States to representation in Congress rested exclusively with the respective houses, and announced his readiness to consider other plans for reconstruction, heated opposition by the radicals in Congress was called out by this proclamation. They feared that it did not sufficiently guarantee the abolition of slavery, which up to this time rested on the war powers of the President, and they asserted that it was the right of Congress, rather than of the President, to determine the conditions and the process of reconstruction. In a bill which passed the House by a vote of 73 to 59 and was concurred in by the Senate, Congress provided that reconstruction was to be begun only when a majority of the white male citizens of any one of the Confederate States should take oath to support the Constitution of the United States. The President should then invite them to call a Constitutional Convention. The electors of this convention would be required to take an oath of

allegiance which excluded a much larger class than those deprived of the benefit of the amnesty proclamation, for it eliminated all who had voluntarily borne arms against the United States, or encouraged hostility to it, or voluntarily yielded support to any of the Confederate Governments. The bill also required that the State Constitution should exclude a large proportion of the civil and military officers of a Confederate Government from the right of voting, and that it should provide that slavery be forever abolished and that State and Confederate debts of the war period should never be paid. In July 1864 Lincoln gave a "pocket veto" to the bill and issued a proclamation explaining his reasons for refusing to sign. The triumph of Lincoln in the election of 1864 did not clearly signify the will of the people upon the conditions of reconstruction, for the declaration of the Democratic convention that the war was a failure overshadowed the issue, and the Union Party which supported Lincoln was composed of men of all parties.

Thirteenth Amendment.—On Jan. 31, 1865, the House concurred in the vote of the Senate in favour of the 13th amendment to the Constitution abolishing slavery throughout the Union. Four years earlier Congress had submitted to the States another 13th amendment by the terms of which no amendment should ever authorize Congress to interfere with slavery within the States. But owing to the war this amendment had remained unratified, and now Congress proposed to place beyond constitutional doubt, or the power of States to change it, the emancipation of slaves. By Dec. 18, 1865, the amendment had been ratified and was proclaimed in force.

In the meantime, Louisiana, in accordance with Lincoln's proclamation, had adopted a Constitution and abolished slavery within the State. Owing to the obstructive tactics of Sumner, aided by Democrats in the Senate, Congress adjourned on March 4, 1865, without having recognized this new State Government as legitimate. "If we are wise and discreet," said Lincoln, "we shall reanimate the states and get their governments in successful operation with order prevailing and the Union re-established before Congress comes together in December."

President Johnson.—Such was the situation when Johnson took up the Presidency upon Lincoln's death. After an interval of uncertainty in which he threatened vengeance against various Southern leaders, President Johnson accepted the main features of Lincoln's policy. Congress not being in session, he was able to work out an executive reconstruction on the lines of Lincoln's policy during the summer and autumn of 1865. On May 29, he issued a proclamation of amnesty, requiring of those who desired to accept its provisions an oath to support the Constitution and Union, and the laws and proclamations respecting the emancipation of slaves. Certain specified classes of persons were excepted, including certain additions to those excluded by Lincoln, especially "all persons who have voluntarily participated in said rebellion and the estimated value of whose taxable property is over twenty thousand dollars." This provision was characteristic of Johnson, who disliked the Southern planting aristocracy, and aimed at placing the preponderant power in the hands of the Democratic small farmers. As part of his system he issued another proclamation in which he appointed a governor for North Carolina and laid down a plan for reconstruction. By this proclamation it was made the duty of the governor to call a convention chosen by the loyal people of the State, for the purpose of altering the State Constitution and establishing a State Government. The right to vote for delegates to this convention was limited to those who had taken the oath of amnesty and who had been qualified to vote prior to the secession of the State.

Already Virginia, Tennessee, Louisiana and Arkansas had Governments which had been recognized by Lincoln. Between June 13 and July 13, 1865, Johnson applied the same process which he had outlined for North Carolina to the remaining States of the Confederacy. Before Congress met in December all the Confederate States, except Texas (which delayed until the spring of 1866), had formed Constitutions and elected Governments in accordance with the presidential plan. All of their legislatures, except that of Mississippi, ratified the 13th amendment.

Gradually, however, the South turned to its former leaders to shape its policy, and the radical Republicans of the North were alarmed at the rapidity of the process of restoration on these principles. The disorganized and idle condition of the former slaves constituted a serious element in the Southern situation, as Lincoln had foreseen. The negroes expected a grant of land from confiscated Southern estates, and it was difficult to preserve order and to secure a proper labour supply.

Under these conditions the efforts of the South to provide security for their communities by bodies of white militia were looked upon with apprehension by the North, and there was sufficient conflict between the two races to give colour to charges that the South was not accepting in good faith the emancipation of the slaves. Especially irritating to Northern sentiment were the so-called "black codes" or "peonage laws," passed by the newly elected Southern legislatures. They rested on the belief that it was necessary that the former slaves should be treated as a separate and dependent class. Some of these imposed special disabilities upon the negro in the matter of carrying weapons and serving as witnesses. Vagrancy laws and provisions regarding labour contracts which had precedents in colonial and English legislation, but were specifically framed to restrain the negroes only, were common. Mississippi denied them the right to own land, or even to rent it outside of incorporated towns; South Carolina restricted them to husbandry and to farm or domestic service, unless specially licensed.

The Freedmen's Bureau.—The problem of succouring and protecting the negroes had forced itself upon the attention of the North from the beginning of the war, and on March 3, 1865, Congress had created the Freedmen's Bureau with the power to assign abandoned lands, in the States where the war had existed, to the use of the freedmen; to supervise charitable and educational activities among them; to exercise jurisdiction over controversies in which a freedman was a party; and to regulate their labour contracts. The local agents of the bureau were usually Northern men; some of them gave the worst interpretation to Southern conditions and aroused vain hopes in the negroes that the lands of the former masters would be divided among them; and later many became active in the political organization of the negro.

Although the National Government itself had thus recognized that special treatment of the freedmen was necessary, Congress, on assembling in Dec. 1865, was disposed to regard the course of the South in this respect with deep suspicion. Moreover, as the 13th amendment was now ratified, it was seen that the South, if restored according to the presidential policy, would return to Congress with added representatives for the freed negroes. Only three-fifths of the negro slaves had been counted in apportioning representatives in Congress; though now free they were not allowed to vote. Under the leadership of the Radicals, Congress refused, therefore, to receive the representatives of the States which had met the conditions of the President's proclamations. A joint committee of 15 took the whole subject of reconstruction under advisement, and a bill was passed continuing the Freedmen's Bureau indefinitely. When this was vetoed by President Johnson (Feb. 19, 1866) Congress retaliated by a concurrent resolution (March 2) against admitting any reconstructed State until Congress declared it entitled to recognition, thus asserting for the legislative body the direction of reconstruction.

While the measure was under consideration the President in an intemperate public address stigmatized the leaders of the Radicals by name as labouring to destroy the principles of the Government and even intimated that the assassination of the President was intended. It was hardly possible to close the breach after this, and the schism between the President and the leaders of the Union Republican Party was completed when Congress passed (April 9, 1866) the Civil Rights bill over Johnson's veto. The act declared the freedmen to be citizens of the United States with the same civil rights as white persons and entitled to the protection of the Federal Government.

The Fourteenth Amendment.—To place this measure beyond the danger of overthrow by courts or by a change of party majority, on June 13, 1866, Congress provided for submitting to

the States a 14th amendment to the Constitution. This gave constitutional guarantee of citizenship and equal civil rights to freedmen, and in effect provided that when in any State the right to vote should be denied to any of the male inhabitants 21 years of age and citizens of the United States, except for participation in rebellion or other crime, the basis of representation in the State should be reduced in the proportion which the number of such citizens bore to the whole number of male citizens 21 years of age in the State. This section of the amendment, therefore, left the States the option between granting the suffrage to the negro or suffering a proportionate reduction in the number of representatives in Congress. It was a fair compromise which might have saved the South from a long period of misrule and the North from the ultimate breakdown of its policy of revolutionizing Southern political control by enfranchisement of the blacks and disfranchisement of the natural leaders of the whites.

In order to ensure the passage of this amendment the radical leaders proposed bills which declared that, after its adoption, any of the seceding States which ratified it should be readmitted to representation. But it also provided that the higher classes of officials of the Confederacy should be ineligible to office in the Federal Government. These bills were allowed to await the issue of the next election.

For further protection of the rights of the negro, Congress succeeded in passing, over President Johnson's veto, an act continuing the Freedmen's Bureau for two years. Tennessee, having ratified the 14th amendment, was (July 24, 1866) restored to representation and Congress adjourned, leaving the issue between the President and the legislative body to the people in the Congressional elections.

Party Changes.—The campaign brought with it some realignment of party. President Johnson, having broken with the leaders of the Union Republican Party, was more and more forced to rely upon Democratic support, although his executive appointments were still made from the ranks of the Republicans. The so-called National Union convention, which met in Philadelphia in midsummer in an effort to abate sectionalism, and to endorse the President's policy, included a large number of war Democrats who had joined the Union party after the secession of the South, many moderate Southerners, a fragment of the Republican Party, and a few Whigs, especially from the border States. They claimed that the Southern States had a right to be represented in Congress. Other meetings friendly to the Radicals were called, and under the designation of Union-Republican Party they declared for the congressional policy. While the campaign for elections to Congress was in progress the President made a journey to Chicago, speaking at various cities *en route* and still further alienating the Republicans by abuse of his opponents. As a result of the autumn elections two-thirds of the members of the House of Representatives were opposed to him. Almost contemporaneously every seceding State except Tennessee rejected the 14th amendment, paving the way for the entire triumph of the Northern extremists.

Tenure of Office Act.—In the ensuing winter and spring Congress completed the conquest of the President, awed the Supreme Court, and provided a drastic body of legislation to impose negro suffrage on the South. By the Tenure of Office Act (March 2, 1867) Congress forbade the President to remove civil officers without the consent of the Senate, and at the same time by another act required him to issue military orders only through the general of the Army (Grant), whom the President was forbidden to remove from command or to assign to duty at another place than Washington, unless at the request of the officer or by the prior assent of the Senate. These extraordinary invasions of the presidential authority were deemed necessary to prevent Johnson from securing control of the military arm of the Government, and to protect Edwin Stanton, the secretary of war, and Gen. Grant. Fearing the President might take advantage of the interim when Congress would not be in session, the 40th Congress was required to meet on March 4, immediately following the expiration of the 39th.

Other Legislative Acts.—The Reconstruction Act of March 2, 1867, provided for the military Government of the Southern States while the drastic policy of Congress was being carried out. It was passed over the veto of the President and declared that no legal Governments or adequate protection for life or property existed in the seceding States, except Tennessee. These States it divided into five military districts, each to be placed under the command of a general of the Army, whose duty it was to preserve law and order. But the existing civil Governments were declared provisional only and subject to the paramount authority of the United States to abolish, modify, control, or supersede them. The act further provided that a Constitutional Convention might be elected by the adult male citizens of the State, of whatever race, colour or previous condition, resident in the State for a year, except such as might be disfranchised for rebellion or felony.

When the convention, thus chosen under negro suffrage, and with the exclusion of Confederate leaders, should have framed a State Constitution conforming to the Federal Constitution and allowing the franchise to those entitled to vote for the members of the convention, the Constitution was to be submitted for the approval of Congress. If this were obtained and if the State adopted the 14th amendment, and this amendment became a part of the Federal Constitution, then the State should be entitled to representation in Congress; but the senators and representatives sent to Congress were required to take the "iron-clad oath," which excluded those who had fought in the Confederate service, or held office under any Government hostile to the United States, or given support to any such authority.

By the pressure of military control Congress thus aimed at forcing the adoption of the 14th amendment, as well as the acceptance of negro suffrage in the State Constitutions of the South. A supplementary act of March 23, 1867, and an act of interpretation passed on July 19 completed this policy of "thorough." In the registration of voters the district commanders were required to administer an oath which excluded those disfranchised for rebellion and those who after holding State or Federal office had given aid and comfort to the enemies of the United States.

Supreme Court Decisions.—Against this use of military power to govern States in time of peace the Supreme Court interposed no effective obstacle. Like the executive it was subordinated to Congress. It is true that in the case *ex parte* Milligan, decided in Dec. 1866, the court held military commissions unlawful where the ordinary civil tribunals were open. In the case of Cummings v. Missouri (Jan. 14, 1867) it decided also that a State test oath excluding Confederate sympathizers from professions was a violation of the prohibition of *ex post facto* laws; and the court (*ex parte* Garland) applied the same rule to the Federal test oath so far as the right of attorneys to practise in Federal courts was concerned.

But threats were made by the radicals in Congress to take away the appellate jurisdiction of the court, and even to abolish the tribunal by constitutional amendment. The judges had been closely divided in these cases and, when the real test came, the court refused to set itself in opposition to Congress. When Mississippi attempted to secure an injunction to prevent the president from carrying out the reconstruction acts, and when Georgia asked the court to enjoin the military officers from enforcing these acts in that State, the Supreme Court refused (April and May 1867), pleading want of jurisdiction. Chief Justice Salmon P. Chase argued that if the President refused to obey, the court could not enforce its decree, while if he complied with the order of the court, and if the House of Representatives impeached him for refusing to enforce the law, the Supreme Court would be forced to the vain attempt to enjoin the Senate from sitting as a court of impeachment.

In one instance it seemed inevitable that the court would clash with Congress; the McCardle case involved an editor's arrest by military authority for criticizing that authority and the reconstruction policy. But Congress, apprehending that the majority of the court would declare the reconstruction acts unconstitutional, promptly repealed that portion of the act which gave the court jurisdiction in the case, and thus enabled the judges to dismiss the appeal. Afterwards, when the reconstruction policy had been accomplished, the court, in the case of Texas v. White

(1869), held that the Constitution looked to "an indestructible Union composed of indestructible states"; and that although the secession acts were null, and the Federal obligations of the seceding States remained unimpaired, yet their rights were suspended during the war.

Impeachment of President Johnson.—The powerful leaders of the Republicans in Congress had been awaiting their opportunity to rid themselves of President Johnson by impeachment. For full details of these efforts *see* JOHNSON, ANDREW. His trial in the spring of 1868, however, by the Senate resulted in a verdict of acquittal.

"Carpet-baggers."—Meanwhile the military reconstruction of the South and the organization of the negro vote progressed effectively. The party management of the negroes was conducted by "carpet-baggers," as the Northern men who came South to try their fortunes were nicknamed, and by the white loyalists of the South, to whom was given the name "scalawags." In the work of marshalling the freedmen's vote for the Republican Party secret societies like the Loyal League, or Union League played an important part. As the newly enfranchised mass of politically untrained negroes passed under Northern influence politically, the Southern whites drew more and more together and although they were unable under the existing conditions to take control, they awaited their opportunity. A "Solid South" was forming in which old party divisions gave way to the one dominant antagonism to Republican ascendancy by negro suffrage. Politically the important fact was that the Republicans had rejected the possibility of reviving the old party lines in the South, and had gambled upon the expectation of wielding the united coloured vote with such leadership and support as might be gained from former Northerners and loyal whites. In the end negro rule failed, as was inevitable when legal disabilities and military force were removed; but the masses of the Southern whites emerged with a power which they had not possessed under the old rule of the planting aristocracy. For the time being, however, negro votes gave control to the Republicans. In South Carolina, Florida, Alabama, Mississippi and Louisiana the negroes were in a majority; in Virginia, North Carolina, Arkansas and Texas they were in the minority; while in Georgia the two races were nearly evenly balanced.

Ku-Klux Klan.—The white leaders of the South were divided as to the best means of meeting the problem. Some advocated that those entitled to vote should register, and then refrain from the polls, in order to defeat the Constitutions made under negro suffrage, for the law required them to be ratified by a majority of the qualified voters. Others would have the white race bear no part in the process. Societies such as the "Ku-Klux Klan" and the "Knights of the White Camelia" were organized to intimidate or restrain the freedmen. But for the present the Republicans carried all before them in the South. Some of the new State Constitutions imposed severe disfranchisement upon the former dominant class, and before the end of July 1868 all of the former Confederate States, except Virginia, Mississippi and Texas, had ratified the 14th amendment, which was proclaimed in effect. By the beginning of 1870 these three States had also ratified the amendment, as had Georgia a second time, because of her doubtful status at the time of her first ratification.

The Southern States Restored to the Union.—By the summer of 1868 Arkansas, South Carolina, North Carolina, Georgia, Alabama, Louisiana and Florida, having satisfied the requirements of the reconstruction acts, were entitled to representation in Congress. But Georgia did not choose her senators until after the adjournment of Congress, and, inasmuch as the State excluded the negro members of the legislature in September, Congress on reassembling returned the State to military rule until its submission. Alabama was restored in spite of the fact that her white voters had remained away from the polls in sufficient numbers to prevent a majority of all the voters registered from having ratified the constitution. The nominating conventions and the campaign of 1868 gave interesting evidence of the trend of political and economic events. Party lines, which had broken down in the North when all united in saving the Union, were once more reasserting themselves. President Johnson, who had been elected by the Union Republican Party, had found his most effective support among the Democrats. The Republicans turned to Gen. Grant, a Democrat before the outbreak of the war.

Grant Nominated.—The Republican nominating convention met on May 20, 1868, a few days after the failure of the impeachment proceedings, and it chose Grant as the candidate for the Presidency. The platform supported the congressional reconstruction measures. Upon the vital question whether universal negro suffrage should be placed beyond the power of States to repeal it by a new constitutional amendment, the platform declared: "The guarantee by Congress of equal suffrage to all loyal men at the South was demanded by every consideration of public safety, of gratitude and of justice, and must be maintained; while the question of suffrage in all the loyal states properly belongs to the people of those states." Nowhere in the North was the negro an important element in the population, but the North had shown an unwillingness to apply to itself the doctrines of negro rights which had been imposed upon the South. Between 1865 and 1868 Connecticut, Wisconsin, Minnesota, Kansas, Ohio and Michigan had refused to give the negro the right to vote within their own bounds, and this plank was evidence of the unwillingness of the party to make a direct issue of universal negro suffrage. The platform pronounced in favour of payment of the public debt, not only according to the letter but the spirit of the laws under which it was contracted. The significance of this lay in its challenge to the Democratic agitation on the currency question.

It was this question which gave the tone to the proceedings of the Democracy at their convention in July 1868. The situation can best be presented by a brief review of the financial history just preceding the convention. Together with the discussion over political reconstruction in the South, Congress and the Administration had been obliged to deal with the reconstruction of debt, taxation and currency in the nation at the close of four years of expensive war. The problems of funding, readjustment of taxation, and resumption of specie payments proved to be so complicated with the industrial growth of the nation that they led to issues destined to exert a long-continued influence.

Finance.—The various war tariffs, passed primarily for the sake of increased revenue, had been shaped for protection under the influence of the manufacturing interests, and they had been framed also with reference to the need of compensating the heavy internal taxes which were imposed upon the manufacturers. When the war ended, public sentiment demanded relief from these heavy burdens, especially from the irksome internal taxes. The rapidly growing grain-raising districts of the Middle West exhibited a lively discontent with the protective tariff, but this did not prevent the passage in 1867 of the Wool and Woollens Act, which discriminated in favour of the woollen manufacturers and raised the *ad valorem* duty on wool. In spite of several large reductions of internal revenue, the national debt was being rapidly extinguished.

The currency question, however, furnished the economic issue which was most debated. One set of interests aimed at rapidly reducing the volume of the currency by retiring the legal tender notes, or "greenbacks." The secretary of the Treasury, Hugh McCulloch, pressed this policy to the foreground, and desired authority to issue bonds to retire these notes. Another set of interests demanded the retention of the greenbacks, supporting their views by arguments varying according to the degree of radicalism of the speakers. The more moderate, like Senator John Sherman, of Ohio, who reflected the views of parts of the West, argued that the recuperation of the nation and the rapid increase of business would absorb the existing currency, while gold would cease to go abroad. Thus, by the increasing credit of the Government, specie payment would be automatically resumed. The most extreme, so far from contracting the currency by retiring the greenbacks, wished to increase this form of money, while diminishing the circulation of the notes of the national banks. The discussion tended to produce a sectional issue with the West against the East, and a social issue with bondholders

and the creditor class in general arrayed against the less well-to-do. Congress agreed with Secretary McCulloch, and in the Funding Act of 1866 not only provided for converting short-time securities into long-term bonds, but also for retiring $10,000,000 of greenbacks in six months and thereafter not more than $4,000,000 monthly. But the agricultural depression of 1866 produced a reaction. Loud demands were made that bonds should be paid in greenbacks instead of coin and the national bank-notes suppressed. In 1868, on the eve of the presidential campaign, Congress, alarmed by the extent of these popular demands, suspended the process of contraction after $40,000,000 in greenbacks had been retired. Ohio was the storm centre of the agitation. The "Ohio idea" that greenbacks should become the accepted currency of the country was championed by George H. Pendleton, of that State, and his friends now brought him forward for the Democratic nomination for President on this issue. In the national convention of that party they succeeded in incorporating into the platform their demands that there should be one currency for the Government and the people, the bondholder and the producer, and that where the obligations of the Government did not expressly provide for payment in coin, they should be paid in lawful money (*i.e.*, greenbacks) of the United States.

But another wing of the Democratic Party desired to make prominent the issue against the reconstruction measures of the Republicans. This wing added to the platform and declaration that these acts were unconstitutional and void, and the demand that the Southern States should be restored to their former rights and given control over their own elective franchise.

Democrats Nominate Seymour.—Although the followers of Pendleton had shaped the financial plank of the platform, they could not nominate their leader. The opposition was at first divided between the various candidates. New York, which feared the effect upon the conservative financial interests of the East if Pendleton were nominated, attempted to break the deadlock by proposing an Ohio man, Chief Justice Chase. But eager as Chase was for the Presidency he had flatly refused to abandon the views which he held in favour of negro suffrage. Ohio was, therefore, able to retaliate by stampeding the convention in favour of Horatio Seymour, of New York. As the war governor of his State he had been a consistent critic of the extremes to which the Federal Administration had carried its interpretation of the war power. For vice-president the convention nominated Francis P. Blair, jun., of Missouri.

Grant Elected.—But the popularity of Grant in the North, together with the Republican strength in the States of the South which had been reconstructed under negro suffrage, gave an easy victory to the Republicans in the election of 1868. Seymour carried only Delaware, New Jersey, New York and Oregon, of the North; and Maryland, Kentucky, Georgia and Louisiana of the South. Tennessee, and five of the former Confederate States, upon which negro suffrage had been imposed (North Carolina, South Carolina, Florida, Alabama and Arkansas) voted for Grant. Virginia, Mississippi and Texas had not yet been restored.

Fifteenth Amendment.—This decisive victory and the knowledge that it had been won by the advantage of the negro vote in the restored States led the Republican leaders to ignore their recent platform declaration in regard to negro suffrage. Shortly after Congress assembled propositions were made to place the freedman's right to vote beyond the power of the States to change. To do this by constitutional enactment it was necessary to make the provision universal, and Congress, therefore, submitted for ratification the 15th amendment declaring that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race, color or previous condition of servitude." Congress was given power to enforce the amendment by appropriate legislation. By March 30, 1870, the amendment had been ratified; but it is doubtful whether this could have been accomplished by legislatures chosen on the issue. As it was, the States of Virginia, Mississippi, Texas and Georgia were required to ratify it as a condition of their readmittance to representation in Congress, and the three former States, having been permitted to vote separately on the obnoxious provisions of their Constitutions in regard to the disfranchisement of former Confederates, rejected those clauses, adopted the 15th amendment and were restored in 1870. Georgia, after a new experience of military rule, likewise ratified the amendment, and her representatives were likewise admitted to Congress.

As soon as the 15th amendment was proclaimed in effect, and the military Governments of the South were superseded, the dominant party proceeded to enact measures of enforcement. These seemed especially necessary in view of the fact that, partly by intimidation of the coloured vote, Louisiana (1868) and Tennessee (1869) broke away from the Republican column; while in the election of 1870 Tennessee, North Carolina, Georgia, Virginia and Alabama went Democratic. The enforcement legislation of 1870 provided penalties for violating the 14th and 15th amendments and re-enacted the Civil Rights Act of 1866. In the years 1871 and 1872 acts were passed providing for effective Federal supervision of Congressional elections, and the "Ku-Klux Acts" (1871 and 1872) still further increased the power of the Federal courts to enforce the amendments and authorized the President to suspend the writ of *habeas corpus* and use military force to suppress public disorders. But these stern measures were accompanied by some efforts to restore harmony, such as the repeal of the "iron-clad oath" for ex-Confederates, in 1871, and the passage of the General Amnesty Act of 1872. The North was becoming restive under the long-continued use of the Federal military arm within State borders in time of peace.

Reconstruction Governments.—In any case the cost of rehabilitating the public works and providing education and the political and judicial institutions which should apply equally to the hitherto non-political class of the blacks, would have been a heavy one. But the legislatures, especially of Louisiana, South Carolina, Tennessee, Arkansas and Alabama, plunged into an extravagance made possible by the fact that the legislatures contained but few representatives who paid considerable taxes. In 1872 it was estimated that the public debts of the 11 reconstructed States amounted to nearly $132,000,000, two-thirds of which was composed of guarantees to corporations. Legislative expenses were grotesquely extravagant, the coloured members in some States engaging in a saturnalia of corrupt expenditure. This alienated from the so-called Radical Party the support of Southern whites, because they resented the concessions of the carpet-bag leaders to the negro vote, because they suffered from the burden of taxation, and above all because race friction increased.

By 1872 a coalition had been formed under the name of Conservatives. But the control of electoral machinery in the strongly centralized State executives chosen by negro votes, and coercion by the Federal authority, still upheld Republican rule in various Southern States. Virginia and North Carolina were practically bankrupt, the capitals of Louisiana, Arkansas and Alabama, where rival State officers claimed possession, were occupied by Federal troops, and many of the Governments were so corrupt that only the contemporaneous rottenness in New York City and in certain branches of the Federal Government afford a parallel.

It was a time of lax public morals after war, which was ill suited to the difficult experiment of transferring political power to a race recently enslaved. Only the strong arm of the Federal authority sufficed to prevent the whites of the South from overthrowing a condition of things which it was impossible under American political ideas permanently to maintain.

Southern Changes.—An important economic reorganization was in progress in the South. White districts were recovering from the war and were becoming the productive cotton areas by the use of fertilizers and by the more intelligent white labour. Cities were rising, and the mines and manufactures of the southern Appalachians were developing. In the black belt, or region of denser negro settlement the blacks became tenant farmers, or workers on shares. The effective and just direction of negro labour was a difficult problem and was aggravated by the political agitation which intensified race friction. It became evident that there was a negro problem as well as a slavery question, and that the North was unable to solve it.

Foreign Relations.—In the meantime important foreign relations had been dealt with by Secretary William H. Seward, under Johnson, and by Secretary Hamilton Fish, under Grant. Not only were many treaties of commerce and extradition, including one with China, negotiated by Seward, but he also brought about a solution of more important diplomatic problems. The relations of the United States with France and England had been strained in the course of the war. Not only had Napoleon III. been inclined to recognize the Confederacy, but he had also taken advantage of the war to throw into Mexico a French army in support of the Emperor Maximilian. The temptation to use force while American military prestige was high appealed even to Gen. Grant; but Seward by firm and cautious diplomatic pressure induced France to withdraw her troops in 1867, and the power of Maximilian collapsed. Russia's friendly attitude throughout the war was signalized by her offer to sell Alaska to the United States in 1867. Seward promptly accepted it and the treaty was ratified by the Senate and the purchase money ($7,200,000) was voted by the reluctant House, which saw little in the acquisition to commend it.

"Alabama" Claims.—With England, affairs were even more threatening than with France. Confederate cruisers (notably the "Alabama"), built in England and permitted by the negligence of the British Government to go to sea, had nearly swept the American merchant marine from the ocean. Unsettled questions of boundary and the fisheries aggravated the ill feeling, and England's refusal in 1865 to arbitrate made a serious situation. Prolonged negotiations followed a change of attitude of England with regard to arbitration, and in 1870 President Grant recommended to Congress that the United States should pay the claims for damages of the Confederate cruisers, and thus assume them against England. However, in 1871, the Treaty of Washington was negotiated under Secretary Fish, by the terms of which England expressed regret for the escape of the cruisers and provided for arbitration of the fisheries, the north-western boundary, and the "Alabama" claims. The case of the United States was victorious, the tribunal awarding damages against Great Britain to the amount of $15,500,000. Two months later the German emperor gave to the United States the disputed north-west boundary, including the San Juan island in Puget sound.

In the West Indies also important questions were presented. Seward had negotiated a treaty of purchase of the Danish West Indies, but the Senate refused to ratify it, nor did Grant's attempt to acquire Santo Domingo meet with a different fate at the hands of that body (1870). In Cuba another insurrection was in progress. Secretary Fish "pigeon-holed" a proclamation of President Grant recognizing the Cubans as belligerents, and secured a policy of neutrality which endured even the shock of the "Virginius affair" in 1873, when 50 of the men of the filibustering steamer flying the American flag were shot by the Spanish authorities. It was shown that the vessel had no right to the flag. Negotiations for an isthmian canal resulted only in a treaty with Nicaragua in 1868 giving to the United States a right of way across the isthmus and providing for a Government survey of the Panama route.

It was in the field of domestic concerns, in economic and social development, that the most significant tendencies appeared. The old issues were already diminishing in importance before the other aspect of reconstruction which came from the revived expansion of the nation toward the West and the new forms taken by the development of American industrial society.

Finance.—The Republican Party, following the traditions of the Whigs, was especially responsive to the demands of the creditor class, who demanded legislation to conserve their interests. Its victory in 1868 was signalized by the passage in the spring of the following year of an act pledging the faith of the United States to pay in coin or its equivalent all the obligations of the United States, except in cases where the law authorizing the issue had expressly provided otherwise. In 1870 and 1871 refunding acts were passed, providing for the issue of bonds to the total amount of $1,800,000,000, one billion of which was to run for 30 years at 4%. This abandonment of the doctrine of early convertibility was made in order to render the bonds acceptable to capitalists, but in fact they soon went to a premium of over 25%.

While the legislature was thus scrupulous of the credit of the nation and responsive to the views of capital, the Supreme Court was engaged in deciding the question of whether the legal tender notes (greenbacks) were constitutional. Successive decisions in 1868 determined that they were not legal in certain cases. In these decisions the judges had divided, four to three. Within a year the court was changed by the appointment of one new judge to fill a vacancy, and the addition of another in accordance with a law enlarging the court. In 1871 the former decision was reversed and the constitutionality of the Legal Tender Acts sustained on loose-construction reasoning. In 1884 the court went to the extent of affirming the right of Congress to pass legal tender acts in time of peace. In 1871 and 1872 Secretary George S. Boutwell illustrated the power of the Administration to change the volume of the currency, by issuing in all over $6,000,000 of legal tender notes; and, following the practice of his predecessors, he sold gold from the Treasury to check speculations in that part of the currency.

Economic Changes.—Speculation and the rapid growth of great fortunes were characteristic of the period. The war itself had furnished means for acquiring sudden riches; the reorganization of taxation, currency and banking increased the opportunities; and the opening of new fields of speculative enterprise in the oil fields of Pennsylvania and Ohio and the gold and silver mines of the mountains of the Far West tended in the same direction. An enormous development of manufactures resulted from the diminished commerce and increased demand for manufactured goods, the protection afforded by the tariff, the stimulus due to rising prices, and the consumption of the rapidly growing West. It was officially reported in 1869 that "within five years more cotton spindles had been put in motion, more iron furnaces erected, more iron smelted, more bars rolled, more steel made, more coal and copper mined, more lumber sawn and hewn, more houses and shops constructed, more manufactories of different kinds started, and more petroleum collected, refined and exported, than during any equal period in the history of the country."

Pacific Railways.—Between the Civil War and 1872, the extension of the nation's activity to the industrial conquest of the great West, as well as the economic reorganization of the East, had a profound effect upon the development of the United States. Between 1862 and 1872 grants were made to the Union Pacific and Central Pacific companies, and to other connecting corporations, for railways from the Missouri to the Pacific, amounting to nearly 33,000,000ac., and in the same period large loans of funds were made by the general Government for this enterprise. Construction advanced rapidly after 1866, and by 1869 an all-rail connection had been established on the line of the Union Pacific and Central Pacific railways between the East and San Francisco. Various grants were made in these years to other roads, both trans-continental and Middle Western. Between 1850 and 1871 Congress granted about 155,000,000ac. for railway construction, but not all these grants were perfected. It is estimated that some $500,000,000 were invested in the construction of Western railways between 1868 and the panic of 1873, and about 30,000m. of railway had been added.

The effects of this extraordinary extension of railway transportation were immediately apparent. In the Far West the railway lines rapidly made possible the extinction of the bison herds. This opened the way for the great extension of the cattle country, following the retreat of the Indians. Upon the plains Indians the effect was revolutionary. Their domain had been penetrated by the railways at the same time that their means of subsistence had been withdrawn. During the Civil War most of these Western tribes had engaged in hostilities against the Federal Government. By the Peace Commission Act of July 20, 1867, commissioners, including Gen. William T. Sherman, were sent to negotiate treaties. As a result the tribes of the Indian Territory were so concentrated as to permit the transfer of other Western tribes to the same region, while the Sioux of the northern plains were given a reservation embracing the western portions of the Dakotas. Discontent with these treaties resulted, however, in hostilities following 1867. Between the close of the war and 1880 some $22,000,000

were expended in Indian wars, although the act of 1871 inaugurated the change of policy whereby the Indians were no longer dealt with by treaty, but were regarded as wards of the nation, to be concentrated on reservations and fed at the expense of the nation under the supervision of Indian agents.

Mining.—Part of these Indian difficulties were due to the opening up of new mining areas in the Rocky Mountains, some of them within the Indians' choicest hunting-grounds. At the beginning of the Civil War a preliminary mining boom struck Colorado; the rich Comstock lode was opened in Nevada; Arizona was the scene of mining rushes; the Idaho mines were entered; and the Montana ores were discovered; so that in the period of the Civil War itself the Territories of Nevada, Idaho and Montana had been organized. The discovery of gold in the Black Hills in 1874 continued the same movement. In 1860 the nation produced $156,000 worth of silver, in 1861 over $2,000,000 and in 1873 nearly $36,000,000. Capital in mines and quarries of the United States was over $65,000,000 in 1860, over $245,000,000 in 1870, and nearly $1,500,000,000 in 1880.

The Middle West.—This revolution in the life of the great plains and the Rocky Mountains, opening the way to agriculture and to cattle raising, and preparing for the exploitation of the precious metals of that great area, was contemporaneous with the important development of the farming regions of the Middle West. Even during the Civil War the agricultural development of the northern half of the Mississippi valley had continued. This was aided by the demand for food products to supply the armies and was made possible by the extension of railways, the taking up of the prairie lands through the operation of the homestead law of 1862, the marketing of the railway land grants, and the increased use of agricultural machinery in those years. Between 1860 and 1870 the population of the North Central group of States increased over 42%, and in the next decade by 34%, a total addition to the population in those two decades of 8,000,000. 'Between 1870 and 1880 about 200,000sq.m. were added to the farm lands of the United States, an area almost equal in extent to that of France. In the same decade the North Central States increased their improved farms from near 78,500,000ac. to over 136,800,000 acres. The production of Indian corn about doubled between 1860 and 1880, and that of wheat and oats more than doubled. The addition came chiefly from the Middle West.

Railway Scandals.—The pressing need of increased transportation facilities had led, as we have seen, to lavish land grants and to subsidies by nation, States and municipalities to the railways. The railways themselves, tempted by these opportunities, had extended their lines in some cases beyond the immediate needs of the regions. Extravagances in construction and operation, aggravated by "construction rings" of railway officials and by rolling stock companies who received extravagant prices by favouritism, brought about a condition where the roads were no longer able to meet the demands of their stockholders for returns on the investment without imposing rates that the Western farmer deemed extortionate. In the competitive development of these roads and in the struggle of business corporations and localities with each other, the roads also discriminated between persons and places. This condition chiefly accounted for the political unrest which manifested itself in the West in the so-called "Granger" movements of the '70s.

"Granger" Movement.—The farmers felt the pressure of the unsettled currency, taxes were very heavy, the protective tariff seemed to them to bear unduly upon the producers of crops which exceeded the home consumption and had to seek the foreign markets. The price of Indian corn, wheat and cotton in the early '70s tended to fall as production rose, so that the gold value of the total crop was not greatly increased during the decade after the war, in spite of increase of production. Dissatisfaction with their share in the prosperity of the country, and especially with the charges of middlemen and transportation companies, discontent with the backwardness of rural social conditions, and a desire for larger political influence, all aided in fostering the growth of organizations designed to promote the farmers' interests. The most influential of these organizations was the Patrons of Husbandry, which was founded in 1867 and spread chiefly after 1872 by local clubs or "granges," especially in the West and South.

The height of the movement was reached in the autumn of 1874. It threatened the disruption of the old political parties in most of the Middle Western States. By holding the balance of power the Grangers secured legislation in many of these States, fixed maximum railway rates, and provided for regulation through commissions. In the reaction after the panic of 1873 (when nearly a fifth of the railway mileage of the United States had passed into the hands of receivers) many of the "Granger laws" were repealed, the regulation was rendered nominal and the railways more than regained their political power; yet the agitation had established the important principle, sanctioned by decisions of the Supreme Court, that the railways were common carriers subject fully to public regulation so far as it was not confiscatory. The movement for regulation of interstate commerce by congressional legislation was begun at this time under the leadership of congressmen from the Granger States. Later efforts were more wisely considered and more effective; but the rural democracy showed its opposition to the increasing political influence of capital, to special privileges and to the attempts of corporations to avoid public control periodically thereafter.

Tweed Ring.—The presidential election of 1872 took place in the midst of this Western upheaval. At the same time in the South the reform Republicans and Democrats were uniting under the name of "Conservatives" against the carpet-bag rule, and control was passing into their hands. A reform movement was active against the evident corruption in national and municipal administrations, for Grant's trust in his appointees was grossly violated. The Tweed ring was systematically looting New York city, and prior to Tweed's indictment in 1871 it was acquiring large power in State legislation Civil service reformers, men of moderate views with respect to reconstruction, many war Democrats who had adhered to the Union Party, and tariff reformers began to break away.

Grant Re-elected.—The Liberal-Republican movement started in Missouri, and a national convention was called to meet at Cincinnati on May 1, 1872. Their platform attacked the corruption of civil service by the Administration, supported the results of the war as embodied in the last three amendments and demanded amnesty and local civil government for the South. It opposed further land grants to railways, but denounced repudiation and demanded specie payments in terms which excluded from its support the advocates of inflation of the currency. This effort to combine the opponents of Grant's Administration was wrecked by the nomination of Horace Greeley, a strong protectionist, who did not command the confidence of the masses of the disaffected. Although endorsed by the Democrats, Greeley was defeated by Grant, who ran on the record of the Republican Party, which now dropped the word Union from its name. Greeley died before the electoral count; the Democrats won only the States of Maryland, Kentucky, Missouri, Tennessee, Georgia and Texas, the votes of Louisiana and Arkansas being thrown out.

Panic of 1873.—The enormous cost of the war, the excessive railway building, over-trading, and inflated credit and fluctuating currency, the sinking of capital in opening new farming lands and in readjusting manufactures to new conditions brought their results in the panic of 1873, precipitated by the failure (Sept. 18) of Jay Cooke, the financier of the Northern Pacific railway. For over five years the nation underwent a drastic purgation; railway building almost ceased, and so late as 1877 over 18% of the railway mileage of the nation was in the hands of receivers. The iron industry was prostrated, and mercantile failures for four years amounted to $775,000,000. At the close of the period there was a replacement of partnerships and individual businesses by corporations, but in the interval political unrest was in the foreground.

Crédit Mobilier.—The charges that congressmen had been bribed by stock in the Crédit Mobilier, a construction company controlled by Union Pacific stockholders, led to a congressional investigation which damaged the reputations of prominent Republicans, including Vice President Schuyler Colfax; but the same Congress which investigated this scandal voted itself retroactive

increases of salary, and this "back-pay grab" created popular indignation. Evidences of fraud and corruption in revenue collection under the "moiety system," and the general demoralization of the civil service continued. The demand for relief from the stringency of the crisis of 1873 expressed itself in the so-called Inflation Bill (passed April 1874) providing a maximum of $400,000,000 for greenback issues. This was vetoed by Grant, but he later signed a bill accepting as a maximum the existing greenback circulation of $382,000,000. This compromise was satisfactory neither to contractionists nor greenbackers.

Republicans Lose Congress.—The "tidal wave" in the congressional elections of 1874 was the result of these conditions. It marked a political revolution. The House of Representatives, which exhibited a two-thirds Republican majority in 1872, showed an opposition majority of about 70, and the Senate was soon to be close. Such Republican strongholds as Pennsylvania, Ohio and Massachusetts went over to the Democrats in the State elections, while in the grain-raising States of the Middle West the Grangers were holding the balance of power, and in the South the Republican Radicals remained in force in few States and only by the use of Federal troops. President Grant in his message of Dec. 1874 acknowledged that public opinion was opposed to this use of force, but declared that without it negro suffrage would be worse than a mockery. Thus by the year 1874 the era of triumphant Republicanism and reconstruction was closing. The leaders perceiving power about to pass from them rapidly enacted a series of party measures before the meeting of the newly elected Congress. Under the leadership of Senator John Sherman an act was passed (Jan. 14, 1875) providing for resumption of specie payments on Jan. 1, 1879, gradually contracting greenbacks to $300,000,000 and compensating this by expanding the circulation of the national banks.

In the field of the tariff a similar policy was followed. The act of 1870 had somewhat reduced duties on tea, coffee, sugar and iron; but under Western pressure in 1872 the Republican Congress had consented to a 10% reduction on most classes of goods in order to save the general system of protection. On the eve of their relinquishment of full power the Republicans (March 3, 1875) repealed the Tariff Act of 1872, increased the duties on molasses and sugar and increased the revenue tax on tobacco and spirits. Thus the tariff was restored to the war basis, before the incoming Democratic House could block the advance. Similarly on March 1 Congress passed a Civil Rights Act, milder than the measure for which Sumner had fought so long, guaranteeing equal rights to the negroes in hotels, public conveyances, and places of amusement and forbidding the exclusion of them from juries. An effort to pass a new force bill levelled against the intimidation of negro voters failed. By these measures the Republicans placed the important features of their policy where they could be overturned only by a Democratic capture of Presidency and Senate.

Supreme Court Decisions.—In the midst of these changes the Supreme Court handed down decisions undoing important portions of the reconstruction system by restraining the tendency of the nation to encroach on the sphere of the State; and restricting the scope of the recent constitutional amendments. On April 14, 1873, in the Slaughter House cases, the courts held that the amendments were primarily restrictions upon the States for the protection of the freedom of the coloured man, rather than extensions of the power of the Federal Government under the definition of United States citizenship, and that general fundamental civil rights remained under State protection. In the case of the United States v. Reese, decided March 27, 1876, the court declared parts of the act of 1870 (which provided for the use of Federal force to protect the negro in his right to vote) unconstitutional, on the ground that they did not specify that the denial of suffrage must be on the sole ground of race or colour. A reasonable pre-requisite, such as a poll-tax, for voting was permissible. The South later took advantage of this decision to restrain negro suffrage indirectly. In United States v. Cruikshank (1876) the court held that the amendments to the Constitution left it still the duty of the State, rather than of the United States, to protect its citizens, even when whites had mobbed the negroes. In 1883 the court declared the conspiracy clause of the Ku-Klux Act unconstitutional and restricted the application of the law to acts of a State through its officers and not to private citizens. In the same year it declared the Civil Rights Act of 1875 invalid.

In 1875 President Grant refused the appeal of the "carpet-bagger" Gov. Adelbert Ames of Mississippi to be supported by troops, whereupon Ames resigned his office into the hands of the Conservatives. The Mississippi plan of general intimidation of negroes to keep them from the polls was followed in Louisiana, South Carolina and Florida which alone remained Republican. Thus steadily the radical reconstruction policy and Republican control of the South were being reversed. It was made clear that negro suffrage could be enforced upon the South only by military rule which could no longer command Northern sympathy or the sanction of the Federal court. Northern interest increasingly turned to other issues, and especially to discontent over administrative corruption.

Corruption.—The spoils system had triumphed over the advocates of civil service reform to such an extent that Grant abandoned the competitive system in 1875 on the ground that Congress did not support him in the policy. Enormous frauds in the collection of the internal revenue by the whisky ring with the connivance of Federal officials were revealed in 1875, and at about the same time, secretary of War William W. Belknap resigned to avoid impeachment for corruption in the conduct of Indian affairs. The enforced resignation in 1876 of secretary of the Treasury Benjamin H. Bristow, after he had successfully exposed the whisky ring, and of postmaster-general Marshall Jewell, who had resisted the spoils system in his department, tended to discredit the Administration. Blaine, the leader of the Republicans in the House of Representatives, fell under suspicion on account of his earlier relations with the Little Rock and Fort Smith and Northern Pacific railways, which left it doubtful, in spite of his aggressive defence, whether he had not used his influence as Speaker in previous Congresses to secure pecuniary advantages from land grant railways.

Campaign of 1876.—Thus the campaign of 1876 approached, with the Republicans divided into (1) steadfast supporters of the Grant Administration, (2) a discontented reform wing (which favoured ex-Secretary Bristow), and (3) an intermediate group which followed Blaine. This statesman made a bold stroke to shift the fighting which the Democrats planned to make against the scandals of the Administration, to the old-time war issues. By proposing to exclude Jefferson Davis from amnesty, he goaded Southern congressmen into indiscreet utterances which fanned anew the fires of sectional animosity. A compromise candidate was selected in the person of Gov. Rutherford B. Hayes, of Ohio, who had vigorously opposed the greenback movement in his State, and whose life and character, though little known to the general public, made him acceptable to the reform leaders of the party. The Democrats, demanding reform, economy, a revenue tariff and the repeal of the resumption clause of the act of 1875, chose the reform governor of New York, Samuel J. Tilden, as their candidate. The Independent National, or Greenback, Party, which was to develop rapidly in the next two years, nominated Peter Cooper, a New York philanthropist, and demanded the repeal of the Resumption Act, and the enactment of a law providing a paper currency.

Hayes Elected.—The election proved to be a very close contest. Tilden, according to the count of both parties, had a plurality of over 250,000 votes, and at first the leading Republican journals conceded his election. He had carried New York, Indiana, New Jersey and Connecticut and, by the Democratic count, the solid South. But the Republican headquarters claimed the election of Hayes by one electoral vote, based on the belief that the States of South Carolina, Florida and Louisiana had gone Republican. Since these States were in the midst of the transition from negro to white Government, and elections were notorious for fraudulent practices, a serious question was raised, first as to the proper authority to count the electoral vote, and second, how far it was permissible to go behind the returns of the State authorities to ascertain the validity of the canvass of the votes in the

State. The political capacity and moderation of the nation were severely tested; but in the end a characteristic American solution was found by the creation of an electoral commission in which five associate justices of the Supreme Court were joined with an equal number of representatives from each of the two houses of Congress. The result was that this commission refused to "go behind the returns," and Hayes was declared elected by one vote. To prevent the threatened danger of a filibuster by Democrats of the House of Representatives against the completion of the count until after legal date for the inauguration of the President, Hayes's friends agreed with leading Democrats that he would withdraw the Federal troops from Louisiana.

Thus a new era began under a moderate and reforming Republican President, a close Republican Senate and a Democratic House of Representatives. The Southern question was not settled, but other issues of an economic and social nature increasingly forced themselves to the front. During the dozen years that followed Hayes's inauguration neither party held complete possession of both the executive and the two houses of Congress. His own moderate character, the conditions of his election and the check imposed during the first two years by a Democratic House of Representatives (and during the second two years by an opposition in both houses) made the period of Hayes's Administration a transition from the era of reconstruction to the era of dominant economic and reform agitation.

When he withdrew the troops which sustained the Republican Governments in Louisiana and South Carolina, those States returned to the rule of the white Democrats. In the Congress elected in 1878 the former slave States chose 101 Democrats to the House of Representatives and only four Republicans. Leading Republicans like Blaine protested vigorously against the policy, declaring that the men who saved the Union should govern it; and on the other hand the Democrats in Congress added "riders" to appropriation bills designed to starve the Administration into complete cessation of the use of troops and Federal deputy marshals at Southern elections. Due to this policy extra sessions had to be summoned in 1877 and 1879 to provide supplies for the Government. Hayes assisted his party by vetoing these coercive attempts of the Democrats and it was not until later that Federal attempts to supervise Southern elections entirely ceased.

Civil Service Reform.—As his early policy toward the South had dissatisfied many of the leaders of his party, his opposition to the spoils system alienated others. In 1877 a Civil Service Reform Association was formed in New York and extended to other States. In June 1877 President Hayes issued an executive order against the participation of Federal officers in political management, and he furnished evidence of his sincerity by removing Alonzo B. Cornell, the naval officer of New York, who was also chairman of both State and national Republican committees, and Chester A. Arthur, collector of the port of New York. As both were friends of Senator Roscoe Conkling of that State, the leader of the Grant men, this was a bold challenge. The "Stalwarts" answered it by securing the nomination of Cornell as governor of New York and Arthur as vice-president of the United States.

Finances.—The monetary question rose to primary importance at this time. Hayes himself had campaigned in Ohio successfully against the greenback movement, and he chose as his secretary of the Treasury, John Sherman, whose long service as chairman of the finance committee had made him familiar with conditions and influential with moderate men. The *per capita* circulation of the nation had fallen from $20.57 in 1865 to $15.58 in 1877 and was still declining. The remarkable increase in the production of silver, as the new mining regions were opened, was accompanied by a fall in its ratio to gold from 15 to one in 1860 to 17 to one in 1877. Congress had, in 1873, passed an act dropping the standard silver dollar from the list of coins; but though the significance of this omission of a coin not widely circulated passed almost unnoticed at the moment, the demonetization of silver was afterward stigmatized as a conspiracy, "the crime of 1873." As the date (Jan. 1, 1879) for the redemption of the greenbacks in specie approached, demands were renewed for the replacement of national bank-notes by greenbacks, for the postponement, or abandonment of resumption, for the free coinage of silver, and for the use of silver as well as gold in payment of bonds redeemable in "coin." Sectional grouping of debtor against creditor regions, rather than party alignment, showed itself in the votes, for each party had its "soft money" as well as "hard money" followers.

A monetary commission, appointed in 1876, reported in 1877, but without agreement or real influence upon the country. The president took strong ground against free coinage and against the payment of bonds in silver; but the House of Representatives passed the measure, known as the Bland bill, for the free coinage of silver, by a vote of 163 to 34. In the Senate this was amended and as it finally passed both houses it was known as the Bland-Allison Act after the two leaders, the Democratic representative from Missouri and the Republican senator from Iowa. This compromise was carried over the veto of President Hayes and became a law Feb. 28, 1878. In the vote of Feb. 15, all but one of the senators from New England, New York and New Jersey opposed it, while the States west of the Alleghenies furnished only four opposing votes. The law restored the legal tender character of the silver dollar and authorized the secretary of the Treasury to buy silver bullion at the market price, to an amount of not less than $2,000,000 nor more than $4,000,000 per month, and to coin the bullion into silver dollars.

Hardly had the Bland-Allison compromise been effected on the silver issue when an act was passed (May 31, 1878) forbidding the further retirement of greenbacks, which remained at $346,681,000. Substantially the same sectional alignment was followed in the vote on this bill as in the silver votes. Not satisfied with this legislation, nearly 1,000,000 voters cast their ballots for Greenback Party candidates at the congressional elections in the autumn of 1878. The preparations of Secretary Sherman had been so carefully made, and the turning tide of trade brought coin so freely to the United States, that before the date of resumption of specie payments a gold reserve had been accumulated to the amount of $133,000,000 in excess of matured liabilities and the greenbacks rose to par before the date of redemption.

Election of 1880.—In the campaign of 1880, Hayes and Tilden both declined to stand for renomination. Thus the issue of the "fraud of 1876," which the Democratic platform called the paramount issue, was subordinated. Nor was it possible for the Republicans to force the tariff question into a commanding position, for although the Democratic platform declared for a tariff for revenue only, a considerable wing of that party led by Samuel J. Randall, of Pennsylvania, favoured protection. Gen. Winfield S. Hancock, a distinguished soldier in the Civil War, whose nomination for the Presidency by the Democrats was designed to allay Northern distrust, refused to make the tariff a national issue. The recent adjustment of the monetary question and return of prosperity relegated the discussion of the currency also to a subordinate place.

The Republicans, after a heated convention in which the followers of Grant, Blaine and Sherman, fought each other to a deadlock, selected Gen. James A. Garfield of Ohio, who was political manager for Sherman in the convention. This was a blow to the Grant, or "Stalwart" wing, which was, however, partly placated by the nomination of Arthur for the vice-presidency. Garfield's popular plurality was only a little over 9,000 out of a total vote of over 9,000,000; but his electoral vote was 214 to Hancock's 155. The area of the former slave States marked the boundaries between the Republican and the Democratic States, except that Hancock also carried New Jersey, Nevada and California. The Republicans won the elections for the House of Representatives which would meet in 1881, and the Senate was at first nearly evenly divided, two independents holding the balance. In the ensuing four years party lines were badly broken, factions made bitter war upon each other, and the independent reformers or "Mugwumps" grew in numbers. The selection of Blaine as secretary of State committed Garfield to the anti-Grant wing, and the breach was widened by his appointment of the collector of the port of New York against the protests of Roscoe Conkling and Thomas C. Platt, the "Stalwart" senators from New York. They resigned, then sought re-election in order to vindicate the right of senatorial recommendation; but were defeated.

Garfield Assassinated.—In the midst of this excitement the President was assassinated by a disappointed office-seeker of unsound mind. Vice-President Arthur, who succeeded Garfield in Sept. 1881, by his tact and moderation won the admiration of former opponents; but the bad crops in 1881 and the dissatisfaction with boss rule among independent voters caused a Democratic victory in the congressional campaign of 1882.

Legislative Acts.—Garfield's assassination had given new impetus to the movement against the spoils system, a National Civil Service Reform League had been organized in 1881, President Arthur presented the question in his message of December of that year, and in 1882 George H. Pendleton, a Democratic senator from Ohio, urged the subject upon the attention of Congress. Stimulated by the elections of 1882 Congress passed an act (Jan. 16, 1883) authorizing the President to appoint a commission to classify certain of the Federal employees, and providing for appointment and promotion within this classified list by competitive examination. Congressional recommendations for these offices were not to be received, and political assessments for campaign purposes were forbidden. This was an effective beginning in the purification of the civil service; but the evil of assessment of employees was succeeded by the evil of soliciting campaign contributions from corporations interested in legislation. The extension of the competitive list proceeded gradually through succeeding Administrations. The Edmunds Anti-Polygamy Act (1882) was levelled at the Mormons and the Chinese Exclusion Act was passed at the demand of labour, after a long agitation in 1882, the way having been prepared by the Treaty of Peking in 1880. Bills to this effect had been vetoed by Hayes and Arthur as violative of international agreement, but the desire of the politicians to win the California vote, and the compromise by which the exclusion was limited to ten years finally carried the measure, and the Supreme Court (1889) held it constitutional.

Surplus Revenues.—From 1879 to 1890 the Treasury showed a surplus of revenue over expenditure. This furnishes the explanation of much of the legislation of that period. It led to extravagant appropriations, such as the Arrears of Pensions Act of 1879, and the River and Harbor Act of 1882 providing for the expenditure of more than $18,000,000 which was passed over the veto of Arthur. Appropriation bills were merely constructed in various committees of Congress under a system of bargaining between interests and sections with primary reference to the political fortunes of the congressmen.

The surplus also strengthened the demand for a reduction of the tariff. A tariff commission, composed of men friendly to protection, appointed in 1882, proposed an average reduction of 20 to 25%. Nevertheless, in the act as passed in 1883 duties were increased in general on those protected articles which continued to be imported in large volume, especially on certain woollen goods and about two-thirds of the imported cotton goods, and on iron ore and some steel products, while they were lowered on finer grades of wool and cheaper grades of woollen and cotton fabrics, etc. It was unsatisfactory to large portions of both parties and did not materially lower the revenue; but the act of 1883 made extensive reductions in internal taxes. As the Senate had just fallen into the hands of the Republicans, and the House would not become Democratic until the new Congress met, this protective law gave the Republicans the advantage of position. Moreover, the Democrats were themselves divided, 19 Representatives voting with the Republicans on the act of 1883. In the next Congress (1884), when the leaders made an attempt to rally the Democrats to show their position by passing a bill for a horizontal reduction of 20% in general, 41 Democrats voted against the bill and prevented its passage through the House.

Election of 1884.—Thus the campaign of 1884 found both parties still lacking unity of policy although it seemed possible that the tariff might become the touchstone of the contest. The Republicans challenged the independents by nominating Blaine, whose record was objectionable to many reformers, and who had been chiefly identified with the reconstruction politics. The Democrats, taking advantage of the situation, nominated Grover Cleveland of New York. He had won approval by his reform administration as mayor of Buffalo and as governor of New York during the past two years, when he had shown an independence of party "bosses" and had convinced the public of his sincerity and strength of character. He represented conceptions and interests which had grown up since the war, and which appealed to a new generation of voters. The platform emphasized the idea that "new issues are born of time and progress," and made the leading question that of reform and change in Administration, lest the continued rule of one party should corrupt the government. On the question of tariff the Democrats took a conservative attitude, emphasizing their desire to promote healthy growth, rather than to injure any domestic industries, and recognizing that capital had been invested and manufactures developed in reliance upon the protective system. Subject to these limitations, they demanded correction of abuses. The Greenbackers nominated Gen. Benjamin F. Butler of Massachusetts, recently chosen governor of that State on the Democratic ticket, but he polled only 175,000 votes. John P. St. John, the candidate of those who would prohibit the liquor traffic, secured 150,000 votes, an unprecedented gain.

Cleveland President.—The campaign abounded in bitter personalities, and the popular vote was close, Cleveland's plurality being only 23,000. The great State of New York, with electoral votes enough to have turned the scale, was carried by the Democrats by only a few more than 1,000 votes out of a total of over 1,000,000. Cleveland's electoral majority was 37. The election was nevertheless recognized as making an epoch. For the first time since victory came to Lincoln and the Republicans on the eve of the Civil War, nearly a quarter of a century earlier, the country had entrusted power to the Democrats, although over two-thirds of their electoral vote came from the former slave States. New York, Connecticut, New Jersey and Indiana constituted their Northern territory. Perhaps the most significant thing about the result was the evidence that in the North political and sectional habits and prejudices were giving way among a sufficient number of independent voters, responsive to strong personal leadership on reform issues, to turn the political scale. The transition from war issues which began in 1872, and became marked in 1876, was completed by the election of Cleveland in 1884.

During the first half of his term President Cleveland had the opposition of a strongly Republican Senate. In the second half the Senate remained Republican by a majority of two, and the House continued Democratic. His civil service policy naturally met severe criticism not only from his party foes, but also from the spoils men among his Democratic followers, who desired a clean sweep of Republican office-holders, and from those of his independent supporters who looked to him to establish the service on a strictly non-partisan basis. The outcome of the first two years of his Administration was that, of the entire body of Federal office-holders, two-thirds were changed and the obnoxious Tenure of Office Act was repealed, thus leaving the President the right of removal without presenting his reasons. Nevertheless there was a gain, for the criticism by the Republicans placed them on record against the former spoils system; Cleveland somewhat checked the political activity of officeholders; and before leaving the Presidency he transferred the railway mail service to the classified list requiring competitive examination.

The transition of executive power for the time to the Democratic Party, however much it impressed the imaginations of the public, as the end of an era, was not so significant as the national growth and expansion in the decade between 1880 and 1890 whereby forces were set loose which determined the characteristics of the succeeding period. Between these years the nation grew from about 50,000,000 to over 62,000,000. The Middle West, or North Central group of States, gained nearly 5,000,000 and the Western division over 1,250,000. West of the Alleghenies altogether more than 8,000,000 souls had been added, while the old Eastern States gained but 4,000,000. In 1890 the North Central division alone had achieved a population nearly 5,000,000 greater than that of the North Atlantic, while the trans-Allegheny region surpassed the whole East by about 10,000,000, and the numbers of its representatives in House and Senate placed the political destiny of the nation in its hands.

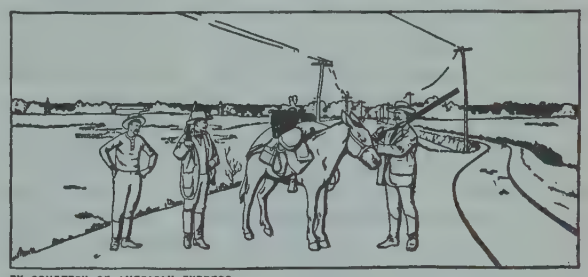
The West.—One of the most important reasons for the wholesale taking up of Western resources in these and the following years was the burst of railway building subsequent to the interruption of the panic of 1873. The eager pioneers pushed into western Kansas and Nebraska as they had into the northern Ohio valley a half-century before. Nebraska grew from a population of 123,000 in 1870 to nearly 500,000 in 1880 and to over 1,000,000 in 1890. From about 333,300 in 1870, Kansas rose to almost 1,000,000 in 1880, and to nearly 1,500,000 in 1890. The railway had "boomed" the Golden West and a cycle of abundant rains seemed to justify the belief that the "Great American Desert" was a myth. Thus settlers borrowed money to secure farms beyond the region of safe annual rainfall under the agricultural methods of traditional pioneering. Swift disappointment overtook them after 1886, when droughts and grasshoppers ruined the crops and turned back the tide of Middle Western colonists until the western parts of these States were almost depopulated, Kansas alone losing one-seventh of its population; nor did prosperity return for a decade.

As the column of settlement along the Ohio valley had extended its flanks into the old North-west between the Ohio and the Great Lakes, and into the old South-west of the lower Mississippi after the war of 1812, so the later pioneers by railway trains began to take possession of the remoter and vaster North-west and South-west. The "granger roads," centring in Chicago, thrust their lines out to develop wheat farms in interior Iowa, Minnesota and the Dakotas, where the virgin soil of the prairie farms brought returns that transferred the wheat belt to this new land of promise, and by competition forced the older wheat areas to develop varied agriculture. The introduction into the Minneapolis mills of the recently invented steel-roller system of making flour not only built up a great flour industry there but created a demand for the hard wheat suited to the North-western prairies. The pine forests of Michigan, Wisconsin and Minnesota were exploited in the same era.

A more impressive movement was in progress as additional trans-continental railways were extended from the frontier to the Pacific. In 1870 for 1,000m. west of Duluth, at the head of Lake Superior, along the line of the projected Northern Pacific railway there were no cities or little towns. Relying upon its land grant and upon the undeveloped resources of the vast tributary region, the railway, after halting for a few years subsequent to the panic of 1873 at Bismarck on the Missouri rushed its construction to Seattle and was opened in 1883. The Great Northern, a product of the vision and sound judgment of James J. Hill, started from St. Paul without a land grant and reached Puget sound in 1893. Thus a new industrial zone had been brought into existence. Colorado had become a State in 1876; in 1889 North Dakota, South Dakota, Washington and Montana were admitted as States and the next year Idaho and Wyoming were added. The Western political forces, especially the friends of silver, were thus given the balance of power in the Senate.

As a new North-west was opened by the completion of the Canadian Pacific (1883), the Northern Pacific (1883) and the Great Northern (1893), so the new South-west was entered by the completion of the Southern Pacific from New Orleans across Texas, New Mexico, Arizona and southern California to San Francisco by 1883. In 1883 also the lines which became the Atchison, Topeka and Santa Fe, extending from the lower Missouri valley, with St. Louis and Kansas City as important terminals, through south-eastern Colorado, northern Arizona and New Mexico, reached the same goal. The Denver and Rio Grande opened new mining areas between Denver and Ogden.

Not only additional mines were reached by these lines, but a great cattle country, recently the habitat of the bison and the Indian, was opened. All the large cities commanding the approaches to this country developed packing industries, but Chicago especially profited. South-eastern Texas was the original home of these cattle ranches, but the driving of herds to supply the miners of the Rocky Mountains revealed the fact that the whole bison country was capable of supporting range cattle, and the practice grew of driving the stock to the feeding ground of the north and returning. The height of the movement along the cattle trail, which in its largest extent ran through the public lands of the great plains from Texas to the Dakotas and Montana, was reached in 1884. In that period cattlemen fought over the possession of the range, controlled vast tracts by seizing the approaches to the water supplies under perversion of the land



BY COURTESY OF AMERICAN EXPRESS

"ON THE NORTH LINE," THE LAND RUSH TO OKLAHOMA IN 1889
Since 1834 the land comprising the present state of Oklahoma had been in the possession of Indian tribes. In 1889 the Federal government purchased a title to a large tract and a proclamation was issued that at noon on April 22nd, this land would be opened to homestead settlement. More than 20,000 people were on the border at the appointed hour

laws, fenced in the public domain, either defiantly or by leases from land grant roads, and called out proclamations of Presidents from Hayes to Cleveland. The steady advance of the farmer, and protective measures against the spread of the cattle disease known as Texas fever, gradually prevented the continuance of the trail, and ultimately broke down the system of great ranches. About 1870 shipment of live-stock from Chicago had become significant, and within a decade the refrigerator car revolutionized the packing industry by making possible the shipment of dressed beef not only to the markets of the Eastern United States but even to Europe. The value of slaughtering and packing industries in the United States increased from less than $30,000,000 in 1870, to $564,000,000 in 1890.

Another important revolution in American economic life was effected by the opening of new iron mines, the growth of the steel and coal industry and the rise of an extraordinary internal commerce along the whole length of the Great Lakes. By 1890 the output of pig-iron in the United States surpassed that of Great Britain, having doubled since 1880. The full meaning of the revolution is seen in the fact that by 1907 the United States produced more pig-iron and steel than Great Britain, Germany and France combined. As a result of the growth of the wheat, lumber and iron-ore production of the North-west, the traffic along the 1,000m. of the Great Lakes grew (chiefly after 1890) by leaps, and changed from wooden sailing-vessels to steel ships driven by steam. The traffic through the Sault Ste. Marie canal came greatly to exceed that through the Suez canal.

The New South.—The South shared in these industrial transformations. Not only did white labour produce an increasing proportion of the cotton crop, but cheap white labour came from the uplands to cotton mills situated at the water-powers. This, with the abundant supply of raw material, enabled the South to develop cotton manufacture between 1880 and 1890 on a scale that threatened New England's dominance. The southern Appalachians began to yield their treasures of coal and iron; northern Alabama became one of the great centres of the iron industry and the South produced nearly 400,000 tons of pig-iron in 1880 and 2,500,000 20 years later. By 1890 the production of coal, iron-ore and pig-iron in this section was as great as that of the United States in 1870. The value of the products of manufacture in the South rose from $338,000,000 in 1880 to $1,184,000,000 in 1900. The exploitation of the long leaf pine forests also attracted Northern capital. Fruit and truck gardening grew rapidly, and the South began to exhibit traits of industrial development familiar in the North and West. The negro problem continued to hold the South as a whole to the Democratic party.

Industrial Changes.—The opportunities opened to capital by these forces of growth in the West and South, as well as the

general influence of an age of machine production, led to transformations in the East which brought new difficulties for political solution. The East began to exhibit characteristics of other long-settled countries where increasing density of population and highly developed industry are accompanied by labour troubles. To capital the opening resources of the West, and the general national prosperity after 1879, offered such inducements that large-scale production by corporations became the order of the day. The forces which had exhibited themselves in increased manufacture and railway development between the Civil War and the panic of 1873 now found expression in a general concentration of industries into fewer plants with vastly greater capital and output, in the combination of partnerships into corporations, and of corporations into agreements and trusts to avoid competition and to secure the needed capital and economies for dealing with the new problems of industrial magnitude. Western farming competition led to the actual abandonment of much inferior land in New England and to agricultural disadvantages in the Middle States. As agriculture became less attractive and as industrial demands grew, the urban population of the East increased at the expense of the rural. The numbers of cities of the United States with more than 8,000 people nearly doubled between 1880 and 1890; by 1900, the urban population constituted a third of the total; this phenomenon was especially marked in the North Atlantic division, where, by 1900, more than half the population was in cities of more than 8,000 inhabitants.

In similar fashion concentration of industry in large establishments was in progress. In 1880 nearly 2,000 mills were engaged in the woollen industry; in 1890 not many more than 1,300. Even more marked was the change in iron and steel, where large-scale production and concentration of mills began to revolutionize this fundamental industry, and other lines of production showed the same tendency. The anthracite mines of Pennsylvania fell into the possession of seven coal-carrying railways which became closely allied in interest. In most of the important industries the tendency of large organizations to subject or drive out the small undertakings became significant. Already the railways, to avoid "cut-throat competition," had begun to consolidate, to form rate agreements and to "pool" their earnings.

Interstate Commerce Act.—The Cullom bill as enacted into the interstate commerce law of Feb. 4, 1887, was framed to prevent unjust discriminations by the railroads between persons, places and commodities, the tendency of which was to foster monopoly. The law forbade discriminations and pooling, made a higher charge for a short haul than for a long haul over the same road illegal, required publicity of rates, and provided for a commission to investigate and fine offenders. But the decisions of the commission were reviewable by the French courts and the offender could be coerced, if he refused to obey the commission, only by judicial proceedings. The commission was empowered to provide uniform accounting and to exact annual reports. The principle settled by the law was an important one, and marked the growing reliance of the former individualistic nation upon Federal regulation. But the difficulties by no means disappeared; the Federal judiciary, refusing to accept the findings of the commission on questions of fact, retried the cases; and the Supreme Court overruled the commission on fundamental questions, and narrowed the scope of the act by interpretation.

Social Unrest.—Labour exhibited the tendency to combination shown by capital. The Knights of Labor, founded in 1869, on the basis of "the individual masses" instead of the trades unions, and professing the principle that "the injury of one is the concern of all," grew from a membership of about 100,000 in 1885 to 730,000 in 1886. The number of strikes in 1886 was more than twice as many as in any previous year. In one of the strikes on the Gould railway system 6,000 mi. of railway were held up. In New York, Henry George, author of books proposing the single tax on land, ran for mayor of the city and received 68,000 out of 219,000 votes. At the same time socialistic doctrines spread, even among Western farmers. But sympathetic strikes, anarchistic outbreaks and drastic plans for social change did not appeal to the people as a whole. The Knights of Labor began to split, and the unions, organized as the American Federation of Labor, began to take their place with a less radical membership. President Cleveland broke with precedents in 1886 by sending in the first message on labour, in which he advocated, without success, a labour commission to settle controversies. A national bureau of labour to collect statistics had been established in 1884; State legislation increasingly provided for arbitration of labour disputes and regulation of factories and child labour.

Early in 1885 a law had been enacted forbidding the importation of labour under contract, and in 1888 the Chinese Exclusion Act was continued. Immigration was exceptionally large in the decade from 1880 to 1890, amounting to about 5,250,000 as compared with 2,800,000 for the previous decade. But a large number of these newcomers settled on the newly opened lands of the Middle West. By 1890 the persons of German parentage in the Middle West numbered more than 4,000,000. Minnesota held 373,000 persons of Scandinavian parentage. The Irish constituted the largest element among the English-speaking immigrants. The population of foreign parentage amounted to one-third of the whole population of the United States in 1890.

In the midst of this national development and turmoil President Cleveland struggled to unite his party on a definite issue. The silver question continued to divide each party, the continued fall of silver leading to renewed agitation for free coinage. The surplus led to extravagant appropriation bills, such as special pension bills, which Cleveland vetoed altogether, thereby incurring criticism by veterans of the Civil War, and river and harbour improvement measures, particularly the act of 1886, to which the President gave reluctant assent, and the bill of 1887, to which he gave a "pocket veto" by refusing his signature. But the retention of the surplus in the Treasury would create a monetary stringency, its deposit in banks aroused opposition and its use to buy bonds was unpopular with the Democrats.

The Tariff.—Cleveland boldly met the issue and gave purpose to his party by his annual message of Dec. 1887, which he entirely devoted to an exposition of the situation arising from the surplus, and to a demand for a revision of the tariff in order to reduce revenue. He did not profess free-trade doctrines: "It is a condition which confronts us, not a theory," he declared. The election of 1886 had reduced the Democratic majority in the House, but the President was able to induce his party to pass the Mills bill (1888) through that body as a concrete presentation of policy. The bill put many important raw materials (including wool) on the free list, substituted ad valorem for specific duties to a large extent, and generally reduced the protective duties. It was believed that the measure would remit more than $50,500,000 of duties, nearly $20,000,000 of which would result from additions to the free list. The Republican Senate also found party unity on the tariff issue and its committee on finance, under the leadership of Sen. Nelson W. Aldrich of Rhode Island, drafted a counter proposal. They would reduce revenue by repealing the taxes on tobacco, and the taxes on spirits used in the arts and for mechanical purposes, and by revising the tariff so as to check imports of articles produced at home.

Harrison Elected.—On the tariff issue the two parties contested the election of 1888, the Republicans denouncing the Mills bill and the Democrats supporting it. Blaine having withdrawn from the contest, and John Sherman having secured but little more than half the votes necessary to nominate, the Republicans picked from a multitude of candidates Gen. Benjamin Harrison of Indiana, grandson of Pres. William Henry Harrison, to run against Cleveland. The popular vote was exceedingly close, but Harrison had an electoral majority of 65, having carried all of the States except the solid South, Connecticut and New Jersey. The increasing use of money to influence the election, and particularly the association of great business interests with such political "bosses" as Matthew S. Quay of Pennsylvania and Thomas C. Platt of New York, were features of the campaign. The congressional elections ensured to the Republicans the undisputed control of all branches of the Government when the 51st Congress should convene, and it was generally agreed that the party had a mandate to sustain the protective tariff.

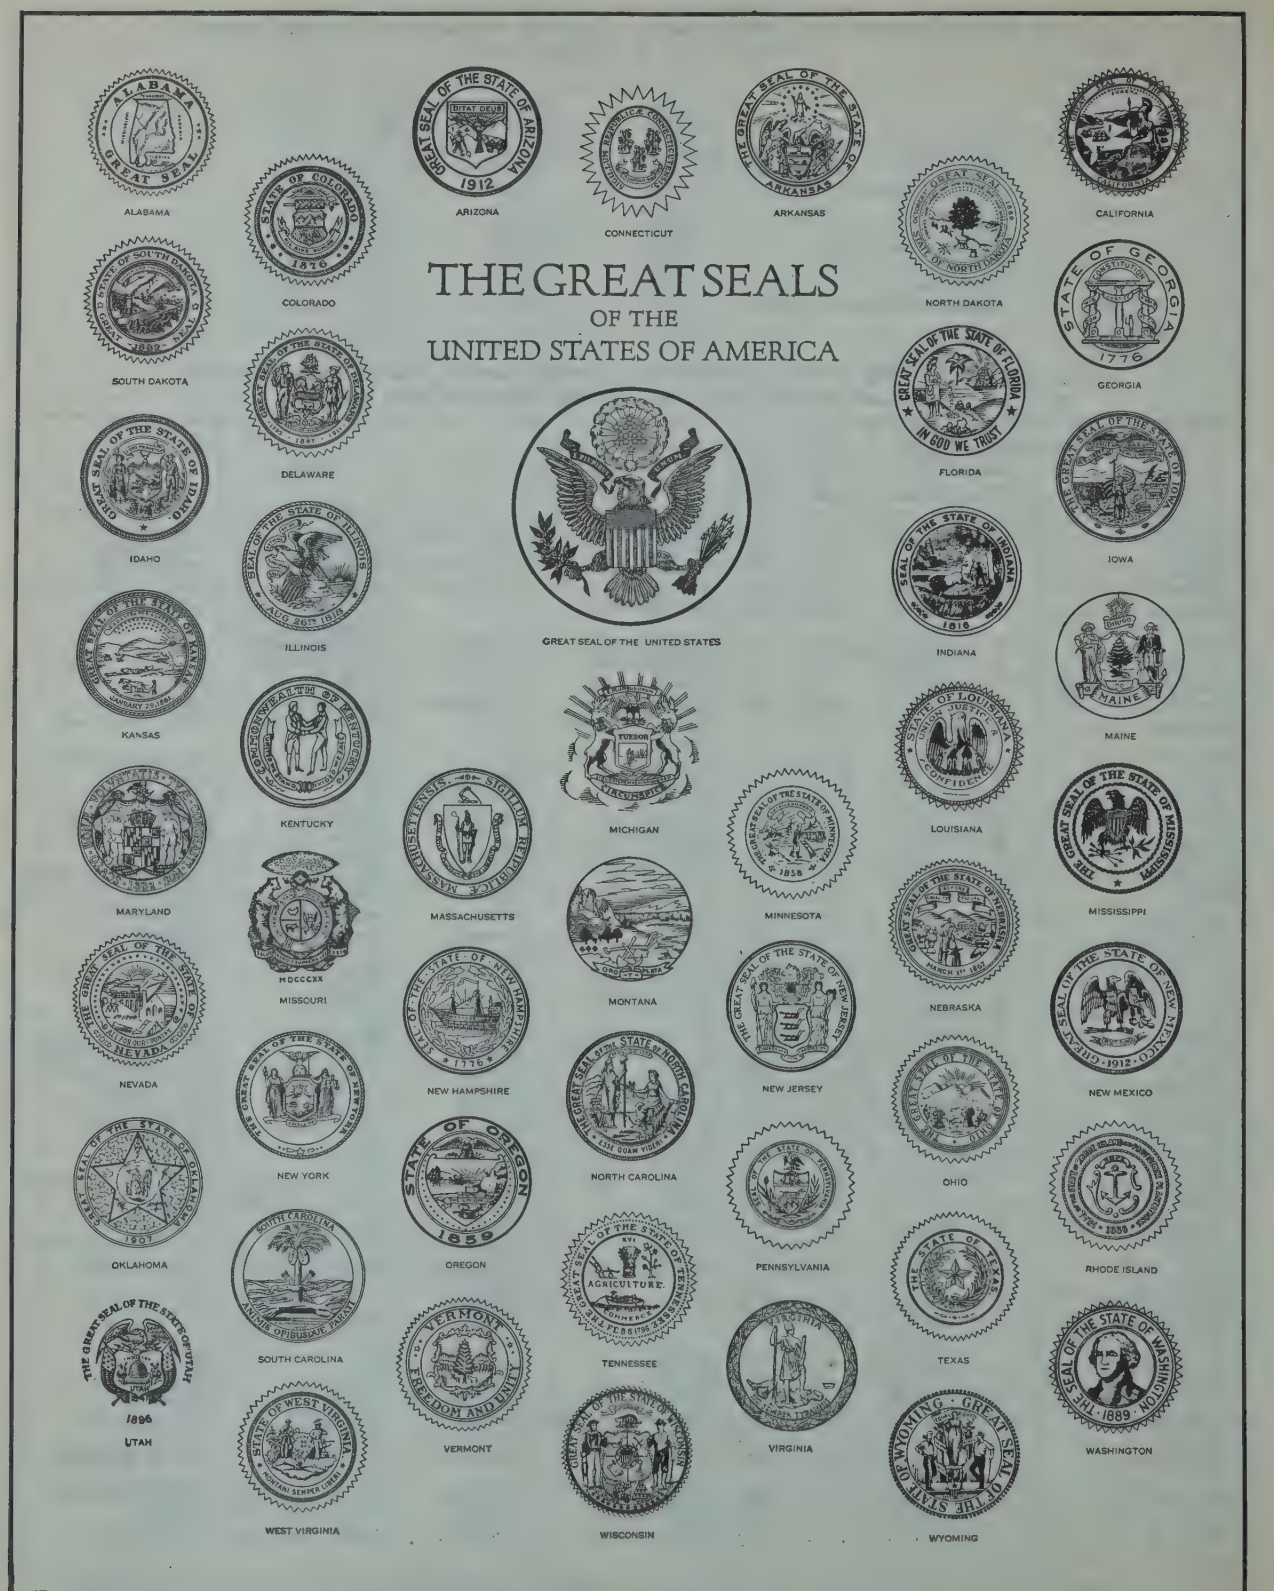
†The date given for the original 13 states is that of the Declaration of Independence. The date for each of the other 35 states is that of the year when they ceased to be territories and became states. The dates when the original 13 states ratified the constitution are: 1787—Delaware, Pennsylvania, New Jersey; 1788—Connecticut, Georgia, Maryland, Massachusetts, New Hampshire, New York, South Carolina; Virginia; 1789—North Carolina; 1790—Rhode Island.

‡Most of the states have more than one popular name. The name given here is that most commonly used.

‖Includes Philippine Islands.

¶Unofficial.



THE GREAT SEALS OF THE UNITED STATES AND OF THE INDIVIDUAL STATES

The design for the Great Seal of the United States of America was adopted June 20, 1782. The reverse side was originally designed, but was never cut

Lacking a large majority in either house the Republicans were exposed not only to the danger of free silver defections in the Senate, but also to "filibustering" by the Democratic minority in the House as the means of blocking the victorious party's programme. These obstructive tactics were made possible chiefly by the use of privileged motions and roll calls to delay business, and the refusal to respond on the roll call for a vote, thus preventing a quorum. Speaker Thomas B. Reed of Maine, a virile and keen-witted leader, greatly strengthened the power of the Speaker, as well as expediting the business of the House, by ruling that the Constitution required a present, not a voting, quorum; and in spite of disorderly protests he "counted a quorum" of those actually present. By securing rules sanctioning this action and empowering the Speaker to refuse to entertain dilatory motions, that officer became the effective agent for carrying on the business of the party majority. As his power through the committee on rules, which he appointed, grew, he came, in the course of time, also to dominate the action of the House, refusing to recognize members except for motions which he approved. This efficiency of action was secured at a loss to the House as a representative and debating body, responsive to minority proposals.

Sherman Anti-Trust Act.—But the discipline of party caucus and House rules enabled the Republican leaders to put through with rapidity a number of important laws. One of these was the measure known as the Sherman Anti-Trust Act of July 2, 1890, which declared combinations affecting commerce between the several States, or with foreign nations, illegal and punishable by fine or imprisonment or both. This act, the full power of which was not exhibited until later, was a response to the growing unrest of the nation as other corporations emulated the success of the Standard Oil Trust (formed in 1882). The members of a trust combined in an organization managed by boards of trustees whose certificates the former owners accepted instead of their shares of stock in the component companies. Competition was thus eliminated within the combination and the greatly increased capital and economies enabled it not only to deal with the increasing magnitude of business operation, but also to master the smaller concerns which opposed it. State legislation had proved unable to check the process, partly because the trust was an interstate affair. By putting into operation its power to regulate interstate commerce, Congress responded to the popular demand for Federal restraint of these great combinations which threatened the old American ideals of individualism and freedom of competition. The trusts, although embarrassed, soon showed their ability to find other devices to maintain their unified control. Nor was the act used, in this period, to prevent the railways from agreements and combinations which in large measure neutralized the anti-pooling clause of the Interstate Commerce Act of 1887.

Silver Purchases.—Another important law was the so-called Sherman Silver Purchase Act of July 14, 1890. By 1889 the ratio of silver to gold had fallen to one to 22. In the 12 years of the Bland-Allison Act of 1878 over 378,000,000 silver dollars had been coined from bullion purchased at the market price. This bullion value was falling: it was $.89 in 1877 and $.72 in 1889. The production of gold in the United States in 1878 was about 2,500,000 fine ounces, and of silver about 35,000,000; in 1890 the gold production was 1,588,000 and the silver 54,500,000. The Silver Purchase Act authorized the secretary of the Treasury to purchase each month 4,500,000 oz. of silver at its market price and to pay for it in treasury notes redeemable at his discretion, in silver or gold.

McKinley Tariff.—The customs duties upon which the fighting of the campaign of 1888 had turned was promptly taken up, and in the McKinley Tariff Act of Oct. 1, 1890 the Republicans embodied their conceptions of protection to American industry. Some of the main features of this law were: the addition of agricultural products to the protected articles; the extension of the free list, particularly the inclusion therein of raw sugar, which had been bringing in a revenue of $50,000,000 annually; the granting of compensating bounties to sugar planters to an amount of about $10,000,000 a year; and the raising of duties to the prohibitory point on many articles of general consumption which could be produced at home. Blaine, then secretary of State, had just been active in promoting closer relations with South America wherein he hoped for an extension of American trade and he severely criticized the bill as it passed the House, because the free list opened wide the doors of American trade, particularly to sugar-producing countries, without first exacting compensating advantages for our products in those markets. To meet this criticism a provision was finally added authorizing the President to impose discriminating duties where it was necessary to obtain the advantages of reciprocity.

This tariff, which passed on the eve of the congressional elections of 1890, was immediately followed by such increases in prices and the cost of living that it was potent in bringing about the political revolution, or "land slide," which swept the Republicans from power in the House of Representatives. The Republicans returned but 88 members as compared with nearly twice that number in the Congress which passed the McKinley bill. Looked at broadly, the movement was a rural uprising, strongest in the South and Middle West, the old Granger areas, against forces which seemed to them to threaten their ideals of American democracy. But the movement was recruited by the silver-mining states and discontented labour interests.

Farm products had not proportionately shared the general increase in prosperity. This convinced large portions of the agricultural West that the currency system had too narrow a basis in gold, which was appreciating in value. Much of the Middle Western agricultural development had been made on borrowed Eastern capital, and it seemed to the farmer that the principal of his mortgage was in effect increasing with the rise in the price of gold, at the same time that his crops brought a smaller net profit. He did not give due attention to the effect of greatly increased production, as the new wheat lands were opened on such a grand scale; but he was keenly sensitive to increased freight rates and to the influence of Eastern capitalists, banks, bondholders, trusts and railways upon Federal and State legislatures and judiciary. After the evidence of the power of this tide of Western discontent in the elections of 1890, those portions of it which were ripest for revolt combined in 1892 as the People's Party or Populists, soon to prove an important political factor.

The Republicans meanwhile had been actively reducing the surplus. In 1892 the excess of revenue over expenditures was $10,000,000; in 1893 only $2,000,000. This was effected not only by the Tariff Act but by such measures as the Dependent Pension Act of 1890 (resulting in a list of pensioners of the Civil War which cost the nation $68,000,000 by 1893, over half of these pensioners having been added during Harrison's Administration); the rapid construction of the new Navy, raising the United States from 12th to fifth in the list of naval powers; the repayment of the direct war tax to the States (1891) to the amount of $51,000,000; and other appropriations such as those provided by river and harbour bills. The Democrats stigmatized this Congress as a "billion dollar Congress" from its expenditures, to which Speaker Reed replied that the United States was a billion dollar nation. In fact the Democrats when they regained power were not able greatly to diminish the cost of government.

Homestead Strike.—The Democratic House in the 52nd Congress repressed obstructive Republican tactics by methods like those adopted by Speaker Reed, and contented itself with passing a series of bills through that body proposing reductions of the tariff in special schedules, including free wool and a reduction of the duty on woollens, free raw material for the cotton planters of the South, free binding twine for the farmers of the North and a reduced duty on tin plate for the fruit raisers. Of course these bills failed in the Republican Senate. A bloody strike on the eve of the election of 1892 in the great steel works at Homestead, Pa., where armed guards engaged by the company fired upon the mob which sought higher wages, was not without its adverse effect upon public sentiment in regard to the Republican tariff for the protection of labour.

During the campaign of 1892 the Democrats rejected a conservative tariff plank, denounced the McKinley tariff in violent language, and denied the constitutional power to impose tariff

duties except for the purpose of revenue only. But Cleveland, who was renominated in spite of vigorous opposition from leading politicians of his own State, toned down the platform utterances on the tariff in his letter of acceptance. In their declarations upon the currency the Democrats furnished a common standing ground for the different factions by attacking the Silver Purchase Act of 1890 as a cowardly makeshift.

Cleveland Re-elected.—The People's Party, in its national convention at Omaha (July 1892), drew a gloomy picture of Government corrupted in all of its branches, business prostrated, farms covered with mortgages, labour oppressed, lands concentrating in the hands of capitalists. Demanding the restoration of government to the "plain people," they proposed an expansion of its powers, to afford an adequate volume of currency and to check the tendency to "breed tramps and millionaires." Among their positive proposals were: the free and unlimited coinage of silver at the legal ratio of 16 to one; the expansion of a national currency issued directly to the people; the establishment of postal savings banks; Government ownership of the railways, telegraph and telephone; restoration to the Government of the lands held by railways and other corporations in excess of their needs; and a graduated income tax. Combining with the Democratic Party in various States beyond the Mississippi, and with Republicans in some of the Southern States, they won large masses of voters in the West, and exerted an influence upon public opinion in that section beyond what was indicated in the returns, although Gen. James B. Weaver of Iowa, their candidate for the Presidency, received over 1,000,000 popular votes and 22 votes in the electoral college. The Republicans renominated President Harrison, though he lacked an enthusiastic personal following. They supported the McKinley Tariff Act in spite of the wave of opposition shown in the elections of 1890. But, fearing party divisions, they, like the Democrats, made an ambiguous declaration on the currency. The result of the election of 1892 was to return the Democrats under Cleveland to power by a plurality of over 380,000 and an electoral plurality of 132. Congress in both branches was to be Democratic in 1893, and the way was open for the first time in a generation for that party to carry out a policy unchecked by any legislative or executive branch of Government.

Panic of 1893.—But before Cleveland was fairly started in his second Administration the disastrous panic of 1893 swept the nation, nor did prosperity return during the four years that followed. The panic is not, directly at least, to be traced to the silver purchases, but was the result of various causes, including the agricultural depression, farm mortgages, reckless railway financing and unsound banking in the United States. The panic began in the spring with the failure of the Reading railway and the collapse of the National Cordage Company, one of the numerous examples of reckless trust financiering into which large banks had also been drawn. Clearing-house certificates were resorted to by the New York banks in June, followed in August by partial suspension of specie payments. Currency remained at a premium for a month; deposits in national banks shrank enormously; national bank loans contracted more than 14·7%; failures were common; 22,000m. of railways were under receiverships, and construction almost ceased.

The panic of 1893 was in many ways a turning-point in American history. It focused attention upon monetary questions, prostrated the silver-mining States, embittered the already discontented farming regions of the West, produced an industrial chaos out of which the stronger economic interests emerged with increased power by the absorption of embarrassed companies, and was accompanied by renewed labour troubles. Most noteworthy of these was the Pullman Car Company strike near Chicago in 1894, which led to sympathetic strikes by the American Railway Union, extending over 27 States and Territories from Cincinnati to San Francisco. Mobs of the worst classes of Chicago burned and looted cars. The refusal of Gov. John P. Altgeld of Illinois to call out the militia, and interference with the United States mails, led President Cleveland to order Federal troops to the scene, on the constitutional ground that they were necessary to prevent interference with interstate commerce and the postal service and to enforce the processes of the Federal courts. The courts issued a sweeping injunction requiring that the members of the American Railway Union or other persons desist from interference with the business of the railways concerned. The president of the striking organization, Eugene V. Debs, was imprisoned for contempt of court and conspiracy.

Silver Issue.—The most immediate political effect of the panic was upon the silver issue. Soon after the outbreak of the financial crisis, the gold reserve, which protected the greenbacks and the Treasury notes issued under the Silver Purchase Act, shrank ominously, while foreigners returned their American securities instead of sending gold. To sell bonds in order to replenish the gold reserve, and to repeal the Silver Purchase Act without substituting free coinage, would aggravate Western discontent and turn away the promise of recruits to the Democratic Party from the Populists of the prairie and silver-mining States; to carry out the Democratic platform by a tariff for revenue only while mills were shutting down would be hazardous in the East. The fruits of victory were turning to ashes; but Cleveland summoned a special session of Congress for August, while the panic was acute, and asked his party to repeal the Silver Purchase Act without accompanying the repeal with provisions for silver. Not until the last of Oct. 1893 was repeal carried, by a vote in which the friends of repeal in the House were about equally divided between Democrats and Republicans, and nearly two-thirds of its opponents Democrats.

By this time the surplus had disappeared and the gold reserve was drawn upon for ordinary expenses. Early in 1894 the Administration, failing to secure legislation from Congress to authorize the sale of gold bonds on favourable terms to protect the reserve, sold under the Resumption Act of 1875 $50,000,000 5% bonds, redeemable in ten years. Part of this very gold, however, was withdrawn from the reserve by the presentation of legal tender notes for redemption, and the "endless chain" continued this operation to the verge of extinguishing the reserve, so that another loan of $50,000,000 in 1894 was followed in 1895 by a dramatic meeting between Cleveland and some of his cabinet with the Wall street banker, J. Pierpont Morgan, who agreed on behalf of his syndicate to sell the Government $65,166,000 of gold for $62,315,000 of bonds, equivalent to 4% bonds for 30 years at a price of 104. In return the syndicate agreed to use its influence to protect the withdrawals of gold from the Treasury. These securities were over-subscribed when offered to the public at 112¼. President Cleveland had protected the Treasury and sustained the parity of gold and silver, but at the cost of disrupting his party. Again, in the beginning of 1896, the Treasury was forced to sell bonds, but this time it dealt directly with the public and easily placed $100,000,000 in bonds at about 111, affording a rate of interest about equal to 3·4%.

Tariff Reform.—Before the political harvest of the monetary issue was reaped, the Democrats had also found party ties too weak to bear the strain of an effective redemption of the party pledges on the tariff. The Wilson bill prepared as the administrative measure was reported late in 1893, while the panic was still exerting a baneful influence. Its leading features were the substitution of *ad valorem* for specific duties in general, the extension of the free list to include such materials of manufacture as iron ore, wool, coal, sugar and lumber, and the reduction of many prohibitory rates. The loss in revenue was partly provided for by an income tax, significant of the new forces affecting American society, and an increase in the duty on distilled liquors. Although the bill passed the House by an overwhelming majority, it met the opposition in the Senate of the representatives, Democratic as well as Republican, of those States whose interests were adversely affected. Led by Senators Arthur P. Gorman, of Maryland; Calvin S. Brice, of Ohio; and David B. Hill, of New York, the bill was transformed by an alliance between Democratic and Republican senators, on the plea that it would otherwise result in a deficit of $100,000,000. Coal, iron ore and sugar were withdrawn from the free raw materials and specific duties replaced *ad valorem* in many cases, while many other individual schedules

were amended in the direction of protection. The House, given the alternative of allowing the McKinley Act to remain or to accept the Senate's bill, yielded, and the Wilson-Gorman Tariff Act became a law without the President's signature, Aug. 27, 1894. Even the income tax was soon (1895) held by the Supreme Court to be unconstitutional.

Venezuela Message.—Toward the close of his administration Cleveland's brusque message on the Venezuelan boundary question aroused such excitement and so rallied the general public (though not the more conservative) that the war spirit, shown soon afterwards against Spain, might have been a potent factor in the election of 1896 had not England exhibited exceptional moderation and self-restraint in her attitude. The silver question, therefore, became the important issue. The Republicans nominated McKinley and declared for the gold standard in opposition to free coinage, losing thereby an influential following in the silver-mining and prairie states, but gaining the support of multitudes of business men among the Democrats in the East and Middle West.

William J. Bryan.—The Democratic convention marked a revolution in the party. The old school leaders were deposed by decisive majorities, and a radical platform was constructed which made "the free and unlimited coinage of both silver and gold at the present legal ratio of 16 to one, without waiting for the aid or consent of any other nation," the paramount issue. Objecting also to the decision against the income tax, and to "government by injunction as a new and highly dangerous form of oppression," they incurred the charge of hostility to the Federal judiciary. William J. Bryan made a brilliant speech in behalf of free coinage, and so voiced the passion and thought of the captivated convention that he was nominated by it for the Presidency over the veteran free-silver leader, Richard P. Bland of Missouri. The Cleveland men, or "gold Democrats," broke with their party after it became committed to free silver, and holding a convention of their own, nominated Gen. John McA. Palmer, of Illinois, for the Presidency on a platform which extolled Cleveland, attacked free coinage and favoured the gold standard. Its main influence was to permit many Cleveland men to vote against Bryan without renouncing the name of Democrats. On the other hand the Populist convention also nominated Bryan on a platform more radical than that of the Democrats.

The contest was marked by great excitement as Bryan travelled across the country addressing great audiences. The endangered business interests found an efficient manager in Marcus A. Hanna of Ohio, McKinley's adviser, and expended large sums in a campaign of education. In the event, the older States of the Middle West, holding the balance between the manufacturing and capitalistic East and the prairie and mining States of the West, gave their decision against free silver. But class appeals and class voting were a marked feature of the campaign, the regions of agricultural depression and farm mortgages favouring Bryan, and those of urban life favouring McKinley. Labour was not convinced that its interests lay in expanding the currency, and Mr. Hanna had conducted McKinley's campaign successfully on the plea that he was the advance agent of prosperity under the gold standard and a restoration of confidence. McKinley carried all the Northern States east of the Missouri, and North Dakota, Oregon and California of the Farther West, as well as Maryland, Delaware, West Virginia and Kentucky. His plurality over Bryan in the popular vote was more than 600,000, and his electoral majority 95. All the departments of Government were transferred by the election to the Republicans.

Dingley Tariff.—Having secured power, the Administration called a special session of Congress, and enacted the Dingley protective tariff (July 24, 1897), under which the deficit in the Treasury was turned into a surplus. The act raised duties to their highest point, and as the protective schedules included some important articles produced by trusts which had a practical monopoly, such as sugar and petroleum, this was seized upon by the Democrats to stigmatize the tariff as the "mother of trusts." Many articles which had been placed on the free list in the Tariff Act of 1894, including lumber and wool were made dutiable.

Gold Standard.—The Republicans also wrote their triumph into the Gold Standard Act of March 4, 1900, which ensured the maintenance of this standard by reserving $150,000,000 of gold coin and bullion to redeem the United States notes and the Treasury notes of 1890, and by authorizing the sale of bonds when necessary to maintain the reserve. National banks were authorized in the smaller towns (3,000 or less) with a capital of $25,000, half of that formerly required, and increased circulation was further provided for by permitting the national banks to issue notes on United States bonds up to their par value.

Economic Changes.—The economic policy of the Republicans was facilitated by the prosperity which set in about 1898. The downfall of silver-mining turned the prospectors to seek new gold-fields, and they found them, especially in Alaska; and contemporaneously the chemists discovered cheaper and more efficient methods of extracting the gold from low-grade ores. Within five years after the crisis of 1893 the gold production of the United States nearly doubled. The United States coined $437,500,000 in gold in the five-year period 1897–1902, while the average for five-year periods since 1873 had been only $224,000,000. Thus gold instead of silver began to inundate the market, and to diminish the demand for expansion of the currency. Agriculture, prostrated in the years immediately preceding and following the panic of 1893, turned to the scientific study of its problems, developed dry farming, rotation and variety of crops, introduced forage crops like alfalfa, fed its Indian corn to cattle and hogs, and thus converted it into a profitable and condensed form for shipment. Range cattle were brought to the corn belt and fattened, while packing industries moved closer to these western centres of supply. Dairy-farming replaced the unprofitable attempts of older sections of the Middle West and the East to compete with the wheat-fields of the Farther West. Truck and fruit farming increased in the South, and the canning industry added utility to the fruits and vegetables of the West. Following the trend of combination the farmers formed growers' associations and studied the demand of the market to guide their sales. The mortgaged farms were gradually freed from debt. The wheat crop increased from less than 400,000,000bu. valued at $213,000,000 in 1893 to 675,000,000bu. valued at $392,000,000 in 1898. Prosperity and contentment replaced agitation in the West, and the Republican Party gained the advantage of these changed conditions.

In the South also there was greater contentment as the new industries of iron, textiles and forestry grew, and as the cotton crops increased. Unrest was diminished by the new State Constitutions, which after 1890 disqualified negro voters by educational and tax requirements so contrived as not to disfranchise the poor whites.

In the decade which followed the crisis of 1893 a new industrial structure was made out of the chaos of the panic. "High financing" was undertaken on a scale hitherto unknown. Combinations absorbed their weaker rivals; Standard Oil especially gained large interests in New York banks and in the iron mines and transportation lines about the Great Lakes, while it extended its power over new fields of oil in the South-west. In general, a small group of powerful financial interests acquired holdings in other lines of business, and by absorptions and "community of interest" exerted great influence upon the whole business world. The group of financiers, headed by J. Pierpont Morgan, came to dominate various Southern transportation lines and the anthracite coal roads and mines, and extended their influence to the Northern Pacific railway, while a new genius in railway financing, Edward H. Harriman, began an avowed plan of controlling the entire railway system of the nation. Backed by an important banking syndicate he rescued the Union Pacific from bankruptcy, and with its profits as a working basis he started in to acquire connecting and competing lines. Labour also shared in the general prosperity after 1898. Relative real wages increased, even allowing for the higher cost of living, and the length of the working day in general decreased except in special industries.

General Prosperity.—By 1900 the continental United States had a population of 76,000,000; an aggregate real and personal wealth of $88,500,000,000; a per capita public debt of $14.52, and per capita money circulation of $26.94 against $21.41 in 1896. In 1901 bank clearings amounted to nearly $115,000,000,000 against

$45,000,000,000 in 1894. Imports of merchandise had fallen in this period, while exports rose from about $847,000,000 in 1893 to $1,394,000,000 in 1900. Of these exports foodstuffs and food animals, crude and partly manufactured, aggregated nearly 40% of the total. The production of pig-iron, which was about 7,000,000 long tons in 1893, was nearly twice that in 1900. This economic prosperity and these far-reaching processes of social change by which the remaining natural resources of the nation were rapidly appropriated, went on contemporaneously with the extension of the activity of the nation overseas. The first rough conquest of the wilderness accomplished, the long period of internal colonization drawing to a close, the United States turned to consider its position as a world power.

To understand this position it is necessary to return to an earlier period and briefly survey the foreign relations since the close of the reconstruction era. The most significant and persistent influence came from the growing interest of the United States in the Pacific, as its population and economic power extended to that ocean. The problem of an overflow of Chinese migration to the Pacific coast, and the jeopardizing of the American standard of labour by this flood, had been settled by various treaties and laws since 1880. The question of the relation of the United States to an interoceanic canal was not so easily settled. In 1878 Colombia granted a concession to a French company, promoted by Ferdinand de Lesseps, the engineer of the Suez canal, to dig a tide-level canal through the Isthmus of Panama. President Hayes voiced the antagonism of the United States to this project of European capital in his message of 1880 in which he declared that such a canal should be under the control of this nation, and that it would be "virtually a part of the coast-line of the United States." Although an American company was organized to construct a canal under a concession from Nicaragua in 1884, no real progress was made, and the French company, defeated by engineering and sanitary difficulties, failed at the close of 1888.

Pan-American Congress.—Meantime, for a few months, Blaine, as secretary of State under President Garfield, began a vigorous foreign policy with especial reference to the Pacific. He attempted to get the consent of England to abrogate the Clayton-Bulwer Treaty of 1850, which contemplated the construction of an isthmian canal by private enterprise under joint control and neutralization of the United States and Great Britain, together with such other Powers as should join them. In South America he actively pressed the influence of the United States to settle the war between Chile and Peru. Again, in the years from 1889 to 1892, Blaine held the portfolio of State, and attempted to increase the influence of his country in Spanish America by the Pan-American congress of 1890, which proposed a great international railway system and bank, commercial reciprocity and arbitration, without immediate results. Indeed, the bad feeling aroused by his earlier policy toward Chile found expression in 1891 in a mob at Valparaiso, when some of the men from the United States ship "Baltimore" on shore leave were killed and wounded. An apology averted the war which President Harrison threatened. Blaine also asserted, against Canada particularly, the right of the United States to the seals of the Bering Sea; but in 1893 arbitrators decided against the claim.

Foreign Affairs.—As the Navy grew and American policy increasingly turned to the Pacific, the need of coaling stations and positions advantageous to its sea power was appreciated. By a tripartite treaty in 1889 the Samoan islands were placed under the joint control of the United States, England and Germany, and, a decade later, they were divided among these powers, Tutuila and the harbour of Pago-Pago falling to the United States. The Hawaiian islands, which had been brought under the influence of civilization by American missionaries, were connected by commercial ties with the United States. Upon the attempt of the ruler to overturn the constitution, the American party, aided by the moral support of the United States, which landed marines, revolted, set up a republic, and asked annexation to the Union. A treaty, negotiated under President Harrison to this end, was withdrawn by President Cleveland, after investigation, on the ground that the part of the United States in the revolution was improper. He attempted, without success, to restore the original state of affairs, and on July 7, 1898, the islands were annexed.

President Cleveland's conservatism in this and other matters of foreign policy had not prepared the people for the sudden exhibition of firmness in foreign policy with which he startled the nation in his message of Dec. 1895 upon the question of the boundary of Venezuela. That nation and England had a long-standing dispute over the line which separated British Guiana from Venezuela. Great Britain declined to arbitrate, at the suggestion of the United States, and gave an interpretation to the Monroe Doctrine which the Administration declined to accept. President Cleveland thereupon brusquely announced to Congress his belief that Great Britain's attitude was in effect an attempt to control Venezuela, and proposed that a commission on the part of the United States should report upon the disputed boundary, and support Venezuela in the possession of what should be ascertained to be her rightful territory. Secretary of State Richard Olney declared: "To-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." Great Britain tactfully accepted arbitration, however, and in the end (1899) was awarded most of the territory regarding which she had been unwilling to arbitrate.

Spanish-American War.—The growing activity of the United States in foreign relations next manifested itself against Spain. Cuba in its commanding position with reference to the Gulf of Mexico and the approaches to the proposed isthmian canal, as well as in its commercial relations, and its menace as a breeding spot for yellow fever, had long been regarded by the United States as an important factor in her foreign policy. Between 1868 and 1878 a harsh war had been in progress between the island and the mother country, and American intervention was imminent. But Spain promised reforms and peace followed; again in 1895 revolt broke out, accompanied by severe repressive measures, involving grave commercial injury to the United States.

By the Treaty of Paris, signed Dec. 10, 1898, Spain lost the remaining fragments of her ancient American empire. She relinquished Cuba, which the United States continued temporarily to occupy without holding the sovereignty pending the orderly establishment of an independent Government for the island. Porto Rico, Guam and the Philippines were ceded outright to the United States, which agreed to pay $20,000,000 to Spain, and to satisfy the claims of its citizens against that power. By the treaty Congress was to determine the civil rights and political status of the native inhabitants of the ceded territory.

As a result of the Spanish-American War, the United States found itself in a position of increased importance and prestige among the nations of the world. Especially in the Pacific, it was immediately involved in the diplomatic situation created by the efforts of European States to divide China into spheres of influence or of actual possession. The interests of the United States in the trade with China, as well as her new position in the Philippines, inclined her to oppose this policy, and secretary of State John Hay showed himself one of the great American diplomats in his treatment of this difficult problem. In order to preserve Chinese entity and the "open door" for trade, he drew replies from the nations concerned, the result of which was to compel them to avow and moderate their intentions.

The acquisition of Porto Rico and the acceptance of responsibilities in Cuba gave new importance to the isthmian canal and increased the relative weight of the United States in regard to its control. The popular excitement with which the voyage of the "Oregon" was followed, as it took its way 14,000m. around South America to participate in the destruction of the Spanish fleet in the battle of Santiago, showed the American people the need of such communication between the Atlantic and Pacific coasts.

The Philippines.—But the immediate political issues were concerned with problems of the relation of the newly won lands to the United States Government. Bryan had persuaded his party to join in ratifying the Treaty of Paris, expecting to determine the status of the islands later. But attention soon turned to the insurrection which broke out (Feb. 4, 1899) in the Philippines under Aguinaldo, after it became probable that the Administra-

tion intended to retain these islands, not under a weak protectorate, but as a possession to be ruled and "assimilated." It was not until the spring of 1902 that this insurrection was completely put down, and in the interval the question of the destiny of the islands and the harshness of the measures of repression aroused political debate. The Democrats and many Republicans charged the Administration with a policy of imperialism.

Porto Rico.—The same issue was involved, in its constitutional and economic aspects, in the treatment of Porto Rico and Cuba. While the insurrection continued in the Philippines the government there was legally a military one, although exercised in part through civil officers and commissions. But in the case of Porto Rico the question was whether the "Constitution follows the flag," that is, whether it extended of its own force without an act of Congress to acquired territory, and covered the inhabitants with all the rights of citizens of the United States, as an integral part of the American people.

The Foraker Act of 1900 imposed a special tariff for two years upon Porto Rico, the proceeds to go to that island's own Treasury. The act further asserted the principle that the inhabitants of the new possessions were not incorporated into the United States or entitled to all the privileges of citizens of the United States under the Constitution, by declaring that statutory acts of the United States locally inapplicable should not be in force in Porto Rico. The Supreme Court sustained this act in 1901, holding that Porto Rico was not so strictly a part of the United States that separate customs tariffs could not be imposed upon the territory. The Foraker Act also provided a government for the island. In Cuba the United States remained in authority until May 20, 1902. Details of the arrangements whereby the United States secured the substantial advantages of a protectorate without destroying the independence of Cuba, will be found by the reader in the article on CUBA.

Re-election of McKinley.—Meantime, in the election of 1900, the Democrats renominated Bryan on a platform which opposed the Republican Administration's acts in relation to the newly acquired territory and declared that "imperialism" was the paramount issue. The platform reaffirmed its silver doctrine of the previous campaign and denounced the tariff as a breeder of trusts. The Republicans renominated McKinley and endorsed his Administration. McKinley received an electoral majority of 137 and a popular plurality of 849,790. Before his second term was fairly begun he was shot by an anarchist while attending the Pan-American exposition at Buffalo, and died on Sept. 14, 1901. His wisdom in choosing able cabinet officers, his sympathetic tact in dealing with men and with sections, as well as the victories of the Spanish-American War, had brought him popularity even among his political opponents. But McKinley, like Cleveland, lacked the imagination to perceive and the desire to voice the aspirations and demands that had been gathering force for many years for legislation and executive action that should deal with the problem of effective regulation of the economic forces that were transforming American society. This gave his opportunity to Theodore Roosevelt, who as vice president now succeeded to office.

Roosevelt President.—It was in foreign relations, which Secretary Hay continued to conduct, that continuity with McKinley's Administration was most evident. But even here a bolder spirit, a readiness to break new paths and to take short cuts was shown by the new President. Venezuela had long delayed the payment of claims of citizens of various nations. In 1901, the President, having been informed by Germany of its intention to collect the claims of its citizens by force, but without acquisition of territory, announced that the United States would not guarantee any State against punishment if it misconducted itself, provided that the punishment did not take the form of acquisition of territory. As a result, a blockade of Venezuela was undertaken by the joint action of Germany, England and Italy at the close of 1902. The diplomatic intervention of the United States early the next year resulted in Venezuela's agreement to pay the claims in part and to set aside a portion of her customs receipts to this end. But since the blockading powers demanded preferential treatment, the United States secured a reference of the question to The Hague court, which decided that this demand was justified. Santo Domingo offered a similar problem, having a debt incurred by revolutionary governments, beyond its power to pay, and being threatened with forcible intervention by European States. President Roosevelt, in 1904, declared that in case of wrongdoing or impotency requiring intervention in the western hemisphere the United States might be forced "to the exercise of an international police power." In 1905 Santo Domingo and the United States signed a protocol under which the United States Government was empowered to take possession of the custom-house, conduct the finances and settle the domestic and foreign debts of Santo Domingo. In spite of the refusal of the Senate to assent to this protocol, President Roosevelt put the arrangement unofficially into effect, until, in 1907, the Senate consented to a treaty authorizing it with some modifications.

In the Far East the Boxer insurrection in China had been followed by the combined military expedition of the powers to the relief of Peking (in which the United States shared), and the exaction of a huge indemnity, of which the United States relinquished nearly half of its share, as in excess of the actual losses. The United States protested against Russian demands upon China, and actively participated in the negotiations which resulted in Russia's agreement to evacuate Manchuria. The delays of that power and her policy toward China having led Japan to declare war, Secretary Hay's diplomacy was influential in limiting the zone of hostilities; and the good offices of President Roosevelt brought about the conference between the two powers at Portsmouth, N.H., which terminated hostilities in 1905. The dispute over the boundary between Alaska and Canada was narrowed by diplomatic discussion, and the remaining questions, involving the control of important ports at the head of the great inlets which offered access to the gold-fields, were settled by arbitration in 1903 favourably to the American contentions.

The isthmian canal also received a settlement in this Administration by a process which was thoroughly characteristic of the resolution of President Roosevelt. *See* PANAMA CANAL.

The Philippines.—In the Philippines early in 1901 municipal and provincial governments were provided for, and the President had been for a brief time granted full power to govern the archipelago. He appointed Judge Taft civil governor, and limited the power of the military governor to regions where insurrection continued. On July 1, 1902, congressional authority was substituted for that of the President, but Taft remained governor. The provisions of the Constitution guaranteeing life, liberty and property were in general extended specifically to the dependency, and a legislative assembly was promised, the lower house elective, and the upper house to consist of the Philippine commission. By negotiations with Rome Gov. Taft secured for the Philippines the "friars' lands" which had been a source of friction. On Oct. 16, 1907, the first Philippine assembly was convened in the presence of Taft, then secretary of war.

The tariff question complicated American relations with both the Philippines and Cuba. Beet sugar and tobacco interests feared the competition of these products, and opposed freedom of trade between the United States and the new territories. The Philippine tariff of 1902 made a reduction of only 25% from the Dingley tariff in the case of the products of those islands, instead of the 75% urged by Taft; but the duties were to go to the Philippines. In the case of Cuba a more heated controversy arose over the tariff—Roosevelt strongly urged a substantial reduction in justice to Cuba at several regular and special sessions of Congress; but not until the close of 1903 was a treaty in operation which, under the principle of reciprocity, admitted some products of the United States to Cuba at reduced rates, and allowed Cuban products a reduction of 20% from the Dingley tariff.

The Trusts.—The dominant historical tendencies of the beginning of the 20th century in the United States, however, were characterized by huge combinations of capital and labour, the rapid passing of natural resources into private possession, and the exploitation of these resources on the principle of individualism by aggregations of capital which prevented effective competition by ordinary individuals. Pioneer conceptions of individual in-

dustrial achievement free from governmental restraint were adopted by huge monopolies, and the result was a demand for social control of these dangerous forces.

After the Sherman Anti-Trust Act of 1890 the combinations found in the favourable laws of States like New Jersey opportunity to incorporate under the device of the "holding company," which was supposed to be within the law. A "promotion mania" set in in 1901. The steel industry, after a threatened war between the Standard Oil and Carnegie groups, was united by Pierpont Morgan into the United States Steel Corporation with stocks and bonds aggregating $1,400,000,000. This was only one of the many combinations embracing public utilities of all kinds. Where open consolidation was not effected, secret agreements, as in the case of the meat packers, effectively regulated the market. In the field of railway transportation, Harriman used the bonds of the Union Pacific to acquire the Southern Pacific with the Central Pacific, and by 1906 he was dictator of one-third of the total mileage of the United States. Meanwhile the Great Northern and the Northern Pacific had been brought into friendly working arrangements under James J. Hill, and tried to secure the Burlington railway. A fierce contest followed between the Hill, Morgan and Harriman forces, resulting in a compromise by which the Northern Securities Company, a holding company for the joint interests of the contestants, was created. It was admitted by the counsel for this company that the machinery provided in this organization would permit the consolidation of all the railways of the country in the hands of three or four individuals. By using notes of one railway company, based on its treasury securities, one could acquire a controlling interest in others; and by watering the capital stock, recover the cost of the undertaking, while the public paid the added rates to supply dividends on the watered stock.

Following a similar tendency the great Wall street bankinghouses were dominated by the large financial groups in the interest of speculative undertakings, the directors of banks loaning to themselves, as directors of industrial combinations, the funds which flowed into New York from all the banks of the interior. By a similar process the great insurance and trust companies of New York became feeders to the same operations. Thus a community of control over the fundamental economic interests of the nation was lodged in a few hands.

Such was the situation in domestic affairs which confronted Roosevelt when he became President. In his first message he foreshadowed his determination to grapple with these problems. In 1903 he instructed the attorney-general to bring suit to dissolve the Northern Securities Company as a combination in restraint of trade, and in 1904 the Supreme Court held the merger illegal. But the effect was to increase the tendency to change from incomplete combination of financial interests to consolidated corporations owning the property, and to lead the Government, on the other hand, to seek to regulate these vast business interests by legislation. The Elkins law, passed in 1903, increased the power of the interstate commerce commission to prosecute offenders, especially those who violated the anti-rebating clauses. In the same year the creation of the Federal bureau of corporations provided for increased publicity in the affairs of these organizations.

Combinations of Labour.—Labour was combining in its turn. Not only did local unions in most of the trades increase in number and power, but workers in separate industries over large areas were combined for collective bargaining and a national organization, the American Federation of Labor, had a membership by 1905 of approximately 2,000,000. Labour legislation by the States increased under these influences, and political leaders became increasingly aware of the power of the labour vote, while employers began to form counter organizations to check the growth of the movement. In 1902 Pennsylvania members of the United Mine Workers of America struck. Inasmuch as their employers were the owners of the anthracite coal monopoly under the control of an allied group of coal-carrying railways, the contest was one of far-reaching importance, and soon brought about a coal famine felt throughout the nation. So threatening was the situation that President Roosevelt called a conference of the contestants, and induced them to submit their difficulties to an arbitration commission which, by its report, in the spring of 1903, awarded to the miners shorter hours and an increase of wages.

Steadily the United States enlarged its economic functions. In 1903 Congress created a department of Commerce and Labor and made the secretary a member of the cabinet. The reports of this department gave publicity to investigations of the perplexing industrial conditions. The department of Agriculture enlarged its staff and its activity, investigating different plants and animals, ascertaining means of checking insect pests, advising upon the suitability of soils to crops, seeking new and better seeds, and circulating general information. The contemporaneous development of agricultural education in the various Western and Southern States whose agricultural colleges had been subsidized by land grants and appropriations by the Federal Government, and the experimental farms conducted by railways, all worked to the same end. The nation began also to awake to the need of protecting its remaining forests, which were rapidly falling into the hands of corporations by perversion of homestead and other land laws. President Cleveland had withdrawn large forest tracts, and in 1898 Gifford Pinchot was made head of a division of forestry in the department of Agriculture. In 1901 the work was organized under a separate bureau, and four years later the national forests were placed under his management.

Reclamation.—The increasing demand for lands for agriculture led also, under Roosevelt, to the real beginning of national irrigation actively in the vast arid area of the Far West. The reclamation service was created by the act of June 17, 1902, which set aside the proceeds of the sale of public lands in 13 States and three Territories as a fund for irrigation works. The Government itself reserved timber and coal tracts, water powers and other requisites for construction, and sold the irrigated lands to actual settlers in small farms, while retaining title to the reservoirs and the works. The income from the reclamation fund between 1901 and 1910 aggregated over $60,000,000. By the use of suitable crops and dry farming agricultural occupation was extended into formerly desert lands.

Election of 1904.—In the election of 1904 the popularity of President Roosevelt, after his strenuous activity in challenging some of the strongest tendencies in American life, was put to the test. His political management exhibited the fact that he was trained in the school of the New York politician as well as in the reformer's camp, and he was easily nominated by the Republicans on a platform which endorsed his Administration, and made no promise of tariff changes. The Democrats turned to the Conservative wing, omitted any reference to silver or the income tax, and nominated Judge Alton B. Parker, of New York. The issue of imperialism had been largely eliminated by the current of events and the anti-trust issue was professed by both parties. In the outcome Roosevelt won by the unprecedented popular plurality of over 2,500,000, and an electoral majority of 196.

The State elections of the same period showed that a wave of reform and of revolt against former political forces was rising. In five States which Roosevelt carried by his popularity the machine Republican candidates for governor were defeated by reforming Democratic candidates, and in cities like Chicago and Philadelphia the issues of reform and radicalism won unexpected though temporary success. Roosevelt had "stolen the thunder" of the parties of social unrest, including the old populistic areas of the Middle West and the labour element of the cities, and also retained control of the Republican party machinery.

Roosevelt's Second Administration.—In his second Administration President Roosevelt pressed his policies so hard and with such increasing radicalism that he lost control of the regular organization in Congress before the end of his term. In the House Speaker Joseph G. Cannon, of Illinois, exhibited the full power of his office in concentrating party policies in the hands of the few regular leaders, while in the Senate a directing group of New England men who had served for a long time, chiefly senators Nelson W. Aldrich and Eugene Hale, showed a similar mastery. Against this control a significant revolt, illustrative of revived discontent in the Middle West, was made by the Republican senator Robert M. La Follette, of Wisconsin, who had won his fight in that State

against the faction friendly to the railways, and had secured primary elections, railway rate regulation on the basis of expert valuation of the physical property of the railways, and a system of taxation which rested more heavily upon public utilities. In pressing similar policies upon Congress he became isolated from the party leaders, but forced them to go on record by roll calls.

In New York a legislative investigation of the insurance companies disclosed such connections with the high financing of Wall street as to create widespread distrust and to lead to reform legislation. The attorney who conducted the investigation, Charles Evans Hughes, had shown such ability that he was chosen governor of New York in 1906. His administration was marked by independence of the party machine and a progressive policy. Foreign relations were conducted during the second administration of Roosevelt by Secretary Elihu Root from 1905. He fostered friendly relations with the other American nations, allaying their concern lest ambitious designs of their larger neighbour might endanger their independence. In Cuba a signal illustration of the good faith of the United States was exhibited when an insurrection in the summer of 1906 left the republic substantially without a government. Taft, then secretary of War, was sent, under the treaty provisions for intervention, to organize a provisional Government. During his few days' service as governor-general he set in motion the machinery for restoring order. But Roosevelt had plainly stated that if the insurrectionary habit became confirmed in Cuba she could not expect to retain continued independence.

Japanese Immigration.—Attention was again fixed upon the Pacific coast, not only by the earthquake and conflagration which in 1906 destroyed the business parts and much of the residence section of San Francisco, but also by municipal regulations there against the presence of Japanese in the public schools. The incident seemed to threaten grave consequences, which were averted by the popularity of Roosevelt both in California and in Japan. In the Immigration Act of Feb. 20, 1907, the problem of exclusion of Japanese labour, which underlay the difficulty, was partly solved by preventing the entrance to the continental United States by way of neighbouring countries of persons holding passports issued by a foreign Government for going to other countries or dependencies of the United States.

As a demonstration of the naval power of the United States in Pacific waters, the President sent the American fleet on a cruise around the world, in the course of which they were received in a friendly spirit by Japan. The Navy was increased to keep pace with the growth of that of other nations, both in numbers and size of vessels, in this period, but not to the extent demanded by the Administration. Already a more efficient organization of both Army and Navy had been effected. While the nation prepared for war, it also engaged prominently in the successive international peace congresses between 1899 and 1907, aiming consistently to increase the use of arbitration.

Railway Regulation.—The tendencies of the Government to deal with social improvement were exemplified by the laws of 1906 providing for pure food and meat inspection. The Railway Rate Regulation Act of 1906 strengthened previous interstate acts by including pipe lines (except for gas and water) under the jurisdiction of the interstate commerce commission, and extending the meaning of "common carrier" to include express and sleeping-car companies. Published rate schedules were required, not to be changed without 30 days' notice, and more stringent provisions were made to prevent rebating. The act provided for review by the Federal courts, and did not permit the commission to investigate an increase of rates until the rates went into operation, nor did it provide for a valuation of the railways as a basis of rate-making which the commission had desired. Later acts partly met the demands of railway employees by increasing the liability of common carriers and by providing for shorter hours.

Panic of 1907.—Although Roosevelt had made concessions to the railways in the formation of the act of 1906, his utterances showed a tendency alarming to the large business interests and the holders of corporation securities generally. The unsettled business conditions were reflected in the stock market, and began to produce a reaction against the activity of Government in this direction. The panic of 1907 started with the downfall of an attempted combination of a chain of banks, copper interests and other enterprises, and was followed by the collapse of the Knickerbocker Trust Company in New York (Oct. 21, 1907). The country was generally prosperous, though much of the banking funds was tied up in New York city at this juncture. Clearing-house certificates were resorted to; by Nov. 1 partial suspension was general throughout the nation; and banking facilities were more completely interrupted than at any time since the Civil War. The Government greatly increased its deposits, and offered Panama 2% bonds to the amount of $50,000,000, and 3% certificates for $100,000,000, with the object of providing the national banks a basis for additional note issues. But these were taken only to a small amount, as they proved useful for their moral effect chiefly. An enormous addition to the money supply was made in the course of the panic, both by governmental activity, gold imports and national bank-notes. The crisis was brought to a close before the end of 1907 by the vigour of the Government and the activity of the large financial interests under the lead of J. P. Morgan, who finally entered the field to stop the decline, at the same time that his associates in the Steel Trust acquired possession of their last remaining rival of importance, the Tennessee Coal and Iron Co.

The reaction after the panic, and the loss of influence resulting from his announcement that he would not permit his renomination for the campaign of 1908, left Roosevelt unable to exercise the compelling power which he had displayed in previous years. Congress under the control of the Conservatives refused him legislation which he asked, but before he left the Presidency he raised a new issue to national importance in his calling of a congress of State governors and experts to consider the need of the conservation of natural resources. This congress met in May 1908 and endorsed the proposal for vigorous attention by State and nation to the question.

Election of 1908.—In the campaign of 1908 he succeeded, against the opposition of both the extreme Conservative and the Radical wings, in procuring the nomination of Secretary Taft by the Republicans on a platform endorsing the Roosevelt policies, promising a revision of the tariff at a special session, on the basis of such protection as would equal the difference between the cost of production at home and abroad, together with a reasonable profit to American industries, and providing for maximum and minimum rates to be used in furthering American commerce and preventing discriminations by other nations. A postal bank was promised, a more effective regulation of the railways, and a modification of the Sherman Anti-Trust Act. The Democrats again selected William J. Bryan as their candidate; demanded the enforcement of criminal law against "trust magnates" and such additional legislation as would prevent private monopoly; opposed the use of injunctions in cases where they would issue if no industrial dispute was involved; impugned the Republicans' good faith in tariff revision, promising for themselves a substantial reduction of duties; favoured an income tax and a guarantee fund by national banks to pay depositors of insolvent banks, or a postal savings bank, if the guaranteed bank could not be secured; demanded election of United States senators by direct vote of the people, legislation to prevent contributions by corporations to campaign funds, and a more efficient regulation of railways.

Taft President.—The Republicans won a sweeping victory, Taft's popular plurality reaching about 1,270,000 and his electoral majority 159. But it had been won by some ambiguity of utterance with respect to tariff and railway regulation. The result was made manifest early in the new Administration, when party contentions over the direction of revision of the tariff, the thoroughness of the regulation of railways and corporations, and the question of where the postal bank fund should be placed, resulted in a movement of "insurgency" among the Republicans of the Middle West. The insurgents termed themselves "Progressive Republicans," and did not hesitate to join forces with the Democrats in order to shape legislation to their wishes. Progressives and Democrats united in overturning the control of Speaker J. G. Cannon in the House of Representatives by modifying the rules,

and a group of senators, chiefly from the middlewestern states, destroyed the control of the regular leaders in the upper house. President Taft's influence over the revolting wing was further weakened by the charges made against his secretary of the interior, Richard A. Ballinger, on behalf of Gifford Pinchot, the chief forester, who accused the administration of obstructing Roosevelt's "conservation" policy.

Pinchot was indeed removed from office, but the "conservation" issue was raised to primary importance by the return of Roosevelt from his African trip. His influence was revealed even while he was enjoying the hospitality of European countries. On his return, there was a widely extended desire to know his judgment of the administration's policy; but he maintained silence until the close of the summer of 1910, when in a series of public utterances in the west he ranged himself, on the whole, with the progressive wing and announced a "new nationalism" which should enlarge the power of the federal government and drive the "special interests" out of politics. The "insurgents" achieved remarkable victories in the middle west, California, New Hampshire and New York in the fall conventions and primary elections, retiring various leaders of the regular wing of the Republicans. Senators Aldrich and Hale, former regular leaders in the senate, had already announced their purpose to resign. The result of the autumn elections was a pronounced victory for the Democratic party.

Social Questions.—At the close of the first decade of the 20th century the United States was actively engaged in settling its social and economic questions, with a tendency toward radicalism in its dealings with the great industrial forces of the nation. The "sweatshops" and slums of the great cities were filled with new material for U.S. society to assimilate. To the sisterhood of States had been added Oklahoma (1907), and in 1910 congress empowered New Mexico and Arizona to form constitutions preparatory to statehood, thus extinguishing the last territories, except the insular dependencies and Alaska. Already the food supply showed signs of not keeping pace with the growth of population, while the supply of gold flowed in with undiminished volume. High prices became a factor in the political situation. Between 1890 and 1900, in the continental United States, farms were added in area equal to that of France and Italy combined. Even the addition of improved farm land in that decade surpassed the whole area of France or of the German empire in Europe. But intensive cultivation and agricultural returns hardly kept pace with the growth in population or the extension of farms. (F. J. T.)

FROM 1910 TO ENTRY INTO WORLD WAR I

The Nation in 1910.—The total population of the continental United States in 1910 was 92,000,000. Of these, only 50,000,000 were native whites of native parentage; 13,000,000 were foreign-born, and 19,000,000 others were of foreign-born or mixed parentage. The Negroes and Indians together numbered about 10,000,000. Everybody in the United States except the American Indian was an immigrant from some other country or a descendant of an immigrant. The main race groups were: (1) the descendants of the colonists, who were mainly Anglo-Saxons, with some Germans and Scotch-Irish and small elements of other races; (2) descendants of the Europeans who came over in great numbers from 1820 to 1870; (3) the large number of later immigrants and their children.

In the opening years of the 20th century the country was not yet aroused to the problems arising from this mixture of unassimilated races. Few voices were raised against admitting not only western Europeans, whose languages and customs were much like those of the United States, but men and women from east and southeast Europe and from western Asia. The only bar to immigration based on race was the prohibition, after 1888, of Chinese immigration and the practical exclusion of Japanese labourers by a "gentlemen's agreement" with the Japanese government (1907). The undigested load was becoming heavy.

Defects in Government.—The units of U.S. society were held together by a strong, if complicated, democratic government, well fitted to rule a diverse population. The political forms were familiar to every schoolboy: (1) a group (in 1910) of 46 states, each with its own government rigidly confined by the traditional principle of "checks and balances" into three departments, legislative, executive, judicial; (2) a widely distributed franchise almost equivalent to universal suffrage for adult males; (3) a belief that the courts were the highest authority, not only as to questiohs of personal rights and duties, but as to the validity of the laws and acts of the other two departments; (4) local government of city and town, township and county. This combination of governments was expensive and not highly skilled, but was supported by the conviction of a large part of the population that it was the "best government on earth."

In the organization and conditions of business there could be traced some startling contradictions between the word liberty and the fact. Nominally all kinds of business not prohibited by law were open to all comers in free and honourable competition. In reality, by 1908, a considerable number of both employers and employees were engaged in a combat outside the laws, constant and conscienceless. It was hard for individuals and firms to compete with corporations, and hard for small corporations to compete with large ones. The railways were among the most conspicuous of the large corporations, and they, too, tended to combine into larger and more powerful units. The states could not deal adequately with these powerful bodies because most of the railways and many of the other corporations operated from state to state, and could not be controlled at either end by anything short of federal power.

Political organizations were on nearly the same basis as business companies: they also grew bigger and more powerful and gathered into fewer groups. Nominally, parties are simply associations of voters for common ends. Actually, they are armies acting under commanding leaders who in many cases hold no offices. The evils of this "invisible government," as Elihu Root called it, were apparent. The political philosophy of Americans was based on the belief that mankind was steadily growing better. Hence a tendency to rely upon laws and political devices for correcting the ills of popular government. What was most needed was the leadership of bold and farseeing men.

Finances and the Tariff (1908–13).—Every growing unit in the country was harassed by questions of taxation and expenditure. The U.S. government also sought new resources, and found them in the income tax. This was made possible on July 13, 1909, by the 16th amendment to the constitution, which came into effect on Feb. 25, 1913. Another new resource of the federal government was a tax upon corporations levied on net income (Aug. 5, 1909). The important question of reorganizing the national banking system, so as to furnish a strong national institution, was debated from 1908 to 1912, and was the subject of an elaborate report by a national monetary commission; but no action was taken at that time. The net federal debt was $1,000,000,000, or only about $11 per head of the population.

A financial resource over which congress had sole authority was the tariff. Under strong pressure from members of the party to carry out the promises of the Republican convention of 1908, President Taft, a few days after his inauguration, summoned congress to meet in special session, for the purpose of revising the tariff.

As usual there was a long controversy, which resulted (Aug. 5, 1909) in the Payne-Aldrich tariff. The act created a permanent court of customs appeals, with power to determine finally all questions as to the value of imports, together with a tariff board, expected to make investigations and recommend specific measures which congress might adopt. As to rates, the act was not very different from its predecessor, except for a decided increase of duties on cotton and silk manufactures.

There was a loud outcry that the revision intended by the party platform was a revision downward and not upward. Nevertheless President Taft signed the bill, and in a speech delivered at Winona, Minn., on Sept. 17, 1909, surprised the country by declaring that it was the "best tariff bill that the Republican party has ever passed."

Political Reform (1908–13).—When Roosevelt left the presidency in 1909 the position of president was at a high point. Most presidents had found their principal legislative influence in the veto; Roosevelt had followed the McKinley method of emphasizing his wishes in personal discussion with members of congress. He did more: he revived the Jacksonian method of announcing a legislative plan, and if congressmen hung back, of appealing over their heads to the country at large. A similar policy was adopted by President Taft, who had many of the qualities of leadership. He had served as first civil governor of the Philippines and as sec-

retary of war in the cabinet of Roosevelt, who practically designated him as his successor. Nevertheless, as an avowed inheritor of Roosevelt's policies, he drew upon himself the opposition of Roosevelt's enemies while it soon became apparent that he was not relying upon Roosevelt's friends.

At this time the "primary" method of selecting candidates was spreading rapidly through the union. Candidates for each party were selected by the ballots of the people, thus undermining the convention system. From nominations for local officers the new method had spread, by 1911, to state officers in numerous states; and after 1910 it began to be applied to the choice of delegates to the national party conventions. An unforeseen effect was that the official ballots were made upon the basis of party nominations, with an opportunity for independent voting. The primary thus became a part of the system of public elections, and therefore the party system was engrafted on public law, as a part of the government.

The distrust of conventions and controlled elections extended to the numerous and powerful bosses in city and state legislatures. Three new devices were set at work to curb them and to interest the electors in public measures. The first of these, the referendum (*q.v.*), was by 1909 spreading rapidly through the western states, as a means of checking legislative action contrary to public sentiment. The referendum system furnished a mechanism, usually imbedded in state constitutions, by which on the demand of a sufficient number of voters, a statute could be held back from effect until submitted to a vote of the electors. What was to be done if the legislature refused to enact a statute demanded by the people? The initiative was invoked, by which a designated number of voters could unite on a measure, which must then be submitted to the electors for their suffrages.

A third branch of this system of appeal to the people was the recall (*q.v.*), under which a public officer already chosen by popular vote (and in a few cases those who were appointed in some other way) could be subjected to an election; and, should the majority decide against him, be thereby removed from office. In 1911–12 the question came up in connection with the proposed constitution of the new state of Arizona, which included a provision for the recall of judges. Because of this provision President Taft vetoed the act of admission. The state withdrew the clause, was duly admitted in 1912, and thereupon proceeded to reinsert the recall.

A still wider application of the principle of the responsibility of functionaries to the voters was the recall of judicial decisions, which was advocated by Roosevelt in 1912, but proved to be more than the country desired.

United States senators, till then chosen by state legislatures, were next made subject to popular choice. Urged by public sentiment, congress submitted (June 12, 1912) the 17th amendment, which was duly ratified and added to the constitution (May 31, 1913). Under this, all elections to the senate were to be made by direct popular vote. Another evidence of a rising feeling of responsibility in congress was a statute (Aug. 7, 1911) requiring candidates for the house and senate to submit statements of the money raised and expended in their behalf and limiting the amount which they themselves might spend. One purpose of both these measures was to make it difficult for men to purchase their way into the senate. On July 13, 1912, Sen. W. Lorimer of Illinois was practically expelled from the U.S. senate for buying votes in the legislature.

Another slow reform was in the ballot system. Most cities, towns and states were loaded down with long lists of the officers to be chosen. The result was an agitation for the reform commonly known as the short ballot, by reducing the number of elective officers and increasing the officers to be appointed by the few elective officials. Working difficulties were found in many of these reforms. It was hard to keep the public keyed up to the necessary pitch of thought and attention at every election; but it was evident that the American people intended to free themselves from the shackles of "invisible government."

Social Questions (1908–12).—The spirit of discontent extended to many questions outside of politics. Throughout the Taft administration there was an increasing pressure for equal suffrage —that is, woman suffrage—which, introduced in the territory of Wyoming in 1869, had gradually spread among the far-western states, and then begun working its way eastward. Again, both state and national governments were compelled to deal with the question of alcoholic beverages. From the earliest times there had been restriction on liquor selling and liquor sellers. By 1909 in almost all states there was some form of general legal restriction —prohibition, local option, high licence or a state dispensary system. The question became national, because the liquor trade transported its wares from one state to another; and that brought it within the interstate commerce clause of the constitution and the Interstate Commerce act. Eventually by the original Package act of 1890, congress adopted the policy of prohibiting shipments of liquor into prohibition states. Pure food laws in force before 1909 were supplemented by the Drug Label act of 1912, which greatly aided in preventing the adulteration of drugs.

Many questions arose out of immigration. The laws in 1909 forbade the entry of labourers under a contract to work in the United States, of convicts, diseased persons and the insane; but the execution of the laws was slack. The first statute looking toward decided control of immigration was that of Feb. 1907, which increased the grounds of exclusion, and at the same time provided a plan to help the immigrants in finding work. It also created an immigration commission, which in 1910 made a report in 41 volumes, strongly recommending the sifting of immigrants by testing their ability to read and write some language. Meanwhile, in the decade 1901–10 the number of immigrants rose to an average of 1,000,000 a year. Later, however, the record showed that from 300,000 to 500,000 annually returned to their old homes, the actual rate of increase of population by immigration was no more than about ½% annually.

Labour Questions.—No legal obstacle stood in the way of the right to organize, first, by local trade unions, then by nation-wide unions for single trades, and finally by national unions combining many trades. To this was slowly added by the unions the principle of the "right to labour," which meant both that it was the duty of the community to see that the worker had a job and that at least the skilled workers had a kind of title in their employment, so that it became contrary to good morals for a "scab" to take the place of a striker.

The legal position of labour unions in these controversies was brought out by suits of national importance against unions. In the test case of *Gompers* v. *Buck's Stove and Range Co.*, the charge was that the federation, by posting the company in its publications as "unfair to labour," was boycotting, and thus infringing legal rights. Samuel Gompers, president of the American Federation of Labor, was convicted for contempt of court on the ground that he had refused to obey a court order to abandon the boycott. In 1908 a suit was decided with a verdict of $74,000 damages against a union of the hatters of Danbury, Conn., who had attempted to boycott the products of a local hat manufacturer.

Another phase of the labour situation was the spread of employers' liability laws through various states, and the passing of an act of congress (April 22, 1908) for the protection of the employees of interstate railways. In June 1912 congress added to its previous enactment of an eight-hour maximum regular day for public employees, by providing that all contract work for the federal government must also be on the eight-hour basis. As most labourers were voters they brought powerful influences to bear on state legislatures and on congress in favour of labour. On the other hand, the courts, particularly those of the states, were slow to recognize the changes in industrial conditions.

In addition, the courts began to use a system of labour injunctions: workmen, labour unions and their members were ordered to abstain from committing acts which if committed would presumably violate a law and would thus lead to a prosecution, in which the question of guilt could be settled by a jury. Instead, the courts by injunction would decide on the responsibility and affix a penalty not specifically laid down in any statute.

Trusts and Transportation 1887–1912.—During the 20 years ending with 1910 it became clear that the most difficult question

before the United States government was the regulation of the vast aggregates of capital, commonly called trusts, which, combined into corporations, aimed at the control of particular lines of business, and also of the railways. The efforts of congress to adjust the question were registered in two lines of restrictive statutes, headed by the Interstate Commerce act of 1887 and the Sherman Anti-Trust act of 1890. Upon these was built a structure of decisions by the United States supreme court. To carry out and partly to avoid these decisions, the Mann-Elkins act of June 18, 1910, widely extended the Interstate Commerce acts by including telephones, telegraphs, express and sleeping-car companies, and by setting up a commerce court which was to render decisions on transportation questions. Federal control of railways on the whole worked well. The commission was a striking example of disregard of the principle of separation of powers, inasmuch as it was a rule-making body, an executive body and a court which interpreted its own rules, subject as to some questions of appeal to the federal courts.

The great problem of the trusts was much farther from a solution than that of the railways because the large corporations were linked together through the holding and manipulation of stocks by capitalists and banks, and through the so-called "interlocking of interests." The only effective way of dealing with large corporations whose activities extended from state to state was to bring suit against them for monopolizing or conspiring to monopolize in their lines of trade. It was considered a triumph when (May 9, 1911) the United States supreme court rendered decisions against two of the most powerful trusts—the Standard Oil company and the American Tobacco company. The court held that the antitrust legislation must be interpreted by the "standard of reason"—namely, that a combination was not unlawful or against the public interest unless it actually caused a restraint of trade and commerce among the federal states or with foreign nations. Having thus set up a "rule of reason" which congress had refused to enact, and having created an example of judicial legislation, the court proceeded in both the pending cases to hold that the companies were guilty of attempts to monopolize their lines of trade. As to penalties, the court contented itself with ordering the offenders to disintegrate. The general danger of vast aggregations of capital was ignored.

Foreign Affairs.—The fields of the diplomacy of the United States for many years had been American and Pacific, and in a much smaller degree European. In the second Hague conference of 1907 the United States delegates urged international arbitration; and in accordance with the general principles put forth at that conference, Elihu Root as secretary of state secured 25 arbitration treaties with as many countries (1908). The United States and Great Britain arranged (Jan. 27, 1909) to refer to The Hague tribunal their long-standing dispute on the Newfoundland fisheries. The result was a decision acceptable to both sides (Sept. 7, 1910). In 1911 the Republican majority under President Taft's leadership initiated a policy of commercial reciprocity with Canada. An agreement was made with the Canadian government by which each side should by legislation reduce or abolish duties on certain raw products and manufactures. With great difficulty the necessary bill was pushed through congress (July 1911); but two months later the Canadian electors refused to support the reciprocity agreement, and the plan broke down.

Latin America.—Notwithstanding the position of the United States as the responsible holder of the Philippine Islands, and hence an Asiatic power, the tradition of isolation continued to be a strong force in the public mind. Nevertheless no formidable public protest was made to a policy of special U.S. intervention in Mexico, the Caribbean and the isthmus region. The arrangements of 1902 made Cuba practically a dependency, subject in the last resort to decisions from the White House. President Taft continued the occupation of the Dominican Republic, consent of the senate under a treaty to that effect having been obtained by Roosevelt in 1907. In 1911 Taft secured a convention by which Nicaragua gave exclusive canal privileges to the United States.

The Panama canal was now approaching completion and the little republic of Panamá, which it bisected, though nominally an independent state, was in fact under U.S. control. An act of congress (Aug. 24, 1912) laid tolls on shipping, from which U.S. ships engaged in coastwise trade were to be relieved. The British government lodged a protest on the ground that by its treaty with the United States the canal was to be opened on equal terms to the ships of "all nations"; President Taft, however, stood by the act, and the question was passed on to the next administration.

Still more serious were the relations with Mexico, where, in 1910, a revolution headed by Francisco Madero assailed the government of Porfirio Díaz and drove him after a few months out of the country. Mexico was thrown into confusion, and President Taft found it necessary to place troops on the border. In 1912 he proclaimed an embargo on the export of arms or military supplies to Mexico. Meanwhile the concessions and property of Americans in Mexico were threatened or destroyed. The Americans who had interests in Mexico began a steady pressure for intervention by the United States.

Pacific Relations 1908–12.—Across the Pacific, clouds rose on the diplomatic horizon. The commercial treaties with Japan allowed a reciprocal freedom of residence and trade to the nationals of the two countries. The immigration of Japanese was very distasteful to the people of California, who undertook to restrict Japanese children to separate schools. Behind this difficulty were the rising power of the Japanese and their national spirit, greatly enhanced by their victory over the Russians in 1905. In 1908 Roosevelt sent round the world a powerful naval fleet, which visited Japan and was received with elaborate courtesy by a welcoming Japanese squadron exactly equal in number, ship for ship. In the Root-Takahira reciprocal note of Dec. 1, 1908 (which was never submitted to the senate), the United States practically admitted Japan's special interest in Asiatic affairs. The question of Japanese immigration was settled for the time being by a renewal of the commercial treaty (July 24, 1911). It continued the previous "gentlemen's agreement," according to which, though claiming a right of immigration into the United States, the Japanese government pledged itself not to issue passports to labourers.

Politics 1909–12.—In the action of congress on many of the important issues above discussed no party lines were drawn, though such measures as the tariff and new taxes were distinctly Republican. On the tariff, some members from middle western states, particularly Minnesota, voted against the Payne-Aldrich measure of 1909. Another disturbance was caused by resentment against the speaker of the house, Joseph Cannon of Illinois, who through the union of various powers virtually had a veto on any measure or proceeding which he did not like. Cannon kept too tight a hand; hence (March 19, 1910) a group of Republican "insurgents" joined hands with the Democrats to reduce his prerogatives till Cannon became simply a partisan moderator.

A new issue upon which both parties were divided was covered by the general term "conservation." Although most of the arable land had passed out of its possession, the federal government was still the possessor of great tracts of forest, of mineral lands and of water power. Congress in 1902 provided for a system of irrigation, the cost to be advanced by the government and repaid in instalments by the users of the water. President Roosevelt became interested in stopping the waste of timber and minerals, in preserving part of the gifts of nature for future generations and in retaining public ownership of the utilities of the country, particularly the forests and streams. In 1910 new statutes provided for a fresh classification of land and for the reservation of coal by the government.

Roosevelt and Wilson.—By 1910 it became clear that the Republican party was weakening and that President Taft's popularity and influence were lessening. The state and congressional elections of 1910 were unfavourable to the Republicans. The insurgents, who soon came to be called Progressives, gained most of the Republican districts in the west, and the Democrats gained about 50 seats in congress. This result transferred to the Democrats the control of the house, while in the senate they secured 41 of the 92 members.

A group of dissatisfied Republicans gathered about Sen. Robert

La Follette of Wisconsin as a leader and presumptive candidate for president. Meanwhile state legislatures were passing primary laws which included the election of delegates to national nominating conventions. This made it easier to break through the old-line organizations, as La Follette had done in his own state. Taft's friends and supporters naturally expected that the president would be renominated.

All these calculations were disturbed by the greatest personality in the country, Theodore Roosevelt. A few weeks after leaving the White House (1909) he started on an expedition to Central Africa, and was, on his way back, received in Europe as the former president of the most important of republics and as a commanding personage. He returned to the United States (June 18, 1910) to find political conditions little to his liking. Most of his friends had disappeared from the administration; his policies seemed to him to have been slighted. Taft did not satisfy the former president, and the two drifted apart. On Aug. 31, 1910, at Osawatomie, Kan., Roosevelt set forth a program which he called "the New Nationalism," favouring publicity of the accounts and proceedings of trusts, a tariff commission, a graduated income tax, an adequate army and navy, conservation, protection of labour and the direct primary with the recall of elective officers. For the time being Roosevelt made no direct movement toward standing for the presidency. Meanwhile several of the western states, particularly California under the guidance of Gov. Hiram Johnson, accepted a radical program of political and social reform. A formal breach with Taft and the open candidature of Roosevelt seemed inevitable. The crisis came when (Feb. 12, 1912) President Taft in a speech alluded to the Progressives (evidently having Roosevelt in mind) as "Extremists—not Progressives; they are political emotionaries, or neurotics." This was taken as a challenge, and a few days later Roosevelt openly declared himself a candidate.

The Election of 1912.—As the convention held in Chicago approached, the lines of battle were developed. Behind Taft were William Barnes of New York, Boies Penrose of Pennsylvania, Winthrop Murray Crane of Massachusetts and other "standpat" leaders. Among those in favour of Roosevelt were James R. Garfield of Ohio, Gifford Pinchot of Pennsylvania and a strong body of Republican governors. Roosevelt himself went to Chicago, and threw his immense energy and enthusiasm into the campaign. The convention was a scene of unusual excitement.

The critical decision was made in the preliminary meetings of the national committee, which was strongly "standpat"; for that committee had to decide upon the right of claimants to be inscribed in the preliminary roll of delegates. Every contest except one was settled in favour of the Taft claimants. The shifting of 30 delegates from one side to the other would have brought about a stampede to Roosevelt, but they were not to be had. Roosevelt advised his delegates to take no further part in the proceedings. At the final roll call, June 22, there were 561 votes for Taft, 58 scattering and 107 for Roosevelt, besides 344 Roosevelt men not voting. In the last issue, therefore, Taft had a majority of 50 votes out of 1,070. In the minds of Roosevelt and most of his followers the nomination was a violation of the principles of popular government. Roosevelt openly advised a bolt. This was duly accomplished by a formal Progressive convention. It met in Chicago in August and nominated Roosevelt for president and Hiram Johnson for vice-president.

Meanwhile the Democratic convention met at Baltimore with William J. Bryan in a position to dictate the choice. The apparently sure candidate was Champ Clark of Missouri, speaker of the house of representatives. But under the rules of the Democratic convention requiring a two-thirds majority, he was finally defeated by Woodrow Wilson, governor of New Jersey. The platforms of the two old parties were of the usual type. The Republicans declared for protective duties. The Democrats stood by their platform of a tariff for revenue only, additional regulation of the railways and presidential preference primaries. The Progressive platform was a general program of political reform and "an enlarged measure of social and industrial justice."

Woodrow Wilson's Victory.—Not platforms, however, but men, appealed to the voters. All three candidates took the field. From the first it was clear that the real fight was between Roosevelt and Wilson. The Progressives were well organized, and their convention and campaign included many women. The final question was whether Roosevelt could draw to himself a sufficient number of Democrats to reduce the Democratic vote below the winning point. The result in November showed that the Democrats in the main stood by their party candidates. The total popular Democratic vote, 6,293,454, was only about 115,000 less than in 1908. The total Taft and Roosevelt vote combined was almost exactly the same as that of the Republicans in 1900. Roosevelt polled 4,119,538 popular votes to 3,484,980 for Taft; but he carried only 6 states, with 88 electoral votes, against 2 states with 8 votes for Taft and 40 states with 435 votes for Wilson.

Woodrow Wilson.—On March 4, 1913, Wilson was inaugurated as president. Born in Staunton, Va., in 1856, of Scotch Presbyterian ancestry, he graduated from Princeton in 1879, essayed the practice of law, then was a professor in several colleges. From 1902 to 1910 he was president of Princeton university. He was an easy and attractive speaker and had a remarkable literary style. (*See* WILSON, THOMAS WOODROW.) As governor of New Jersey during 1911 and 1912 he had opportunity to show his skill as a party leader and his interest in reform. In 1912 he was taken up by Bryan, who saw in him an exponent of the political principles for which Bryan had stood and a president who could meet the Progressives on their own ground.

In making up his cabinet it was only reasonable that Bryan should enter it. He was made secretary of state, an office for which he had little adaptation. To a new cabinet office recently created by congress, the secretaryship of the department of labour, Wilson appointed W. B. Wilson, a strict labour organization man. Lindley M. Garrison, secretary of war, and Franklin K. Lane, secretary of the interior, were strong men. Albert S. Burleson, postmaster general, and Josephus Daniels, secretary of the navy, had insufficient training for their duties. David F. Houston of Missouri was made secretary of agriculture, William G. McAdoo, secretary of the treasury, and James C. McReynolds, attorney general. Most of the members of the cabinet were men who could be trusted to follow the president's lead. One remarkable statesman not included in this list was Col. E. M. House of Texas, who for six years was the president's most trusted counsellor and political friend without holding any political office. In the minor civil service Wilson carried out his principles by enlarging the classified list of posts which could be entered only by competitive examinations.

A genial man, who could be a delightful companion, full of experience and of Scotch Presbyterian humour, President Wilson had a powerful mind, an amazing skill of expression and an intense belief in the power of ideals to arouse and inspire a people. He thought he had no need of conferences, of feeling the public pulse, of mixing with members of congress and party leaders, of personally greeting the average voter.

Finance and Tariff, 1913.—The election of 1912 carried with it a safe Democratic majority in the senate and a two-to-one majority in the house. On April 8, 1913, the president created a surprise by appearing in person to address the two houses of congress jointly at the opening of a special session, instead of sending a written message. This practice he followed throughout his administration, with great effect. He felt himself not only chief magistrate of the nation, but head of the Democratic party, and practically the premier of the government from which ought to proceed plans for important legislation.

A special session was called particularly to frame a tariff act. Rep. Oscar Underwood (Ala.), chairman of the committee of ways and means, gave to the new measure his name and experience. The purpose of the statute was to enlarge the free list of raw materials, foodstuffs and some manufacturers, to make a moderate reduction of the protective duties and to correct some of the things which made the Payne-Aldrich act unpopular. Included in the statute was an income tax, at last made possible by the adoption of the 16th amendment (Feb. 25, 1913), which was expected to supply any revenue which might be lost by the reduc-

tion of duties. A tariff commission was created to make researches into the workings of the act and to find out what was the actual difference between the cost of labour in the United States and in other countries (Oct. 3, 1913).

The powerful influence of the president was again exerted to secure a systematic banking system, with the result that (Dec. 23, 1913) the Owen-Glass Federal Reserve Bank act was added to the statutes. The principle was to create a national institution, which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organization in Washington, D.C. In these 12 subdivisions clustered such banks, whether national or state-chartered, as chose to accept. The new institution was also to issue a new form of paper money. The system from the start was recognized as a large national asset. At the same time a Rural Credits act was passed (July 17, 1916), which created a special group of banks to lend money to farmers on the security of their farms.

Transportation, 1914–16.—Under a statute of March 1, 1913, the Interstate Commerce commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit. The Panama canal was now approaching completion. This was the first great agency of transportation owned and managed by the United States government. President Wilson used to the utmost his personal influence for a bill to repeal discrimination in favour of U.S.-owned vessels, of which the British government had complained; it became an act, June 15, 1914. On Aug. 15 the first steamer passed through the canal from sea to sea and in a few months the canal was paying its own way. A new question of transportation was arising through the rapid development of motor vehicles. At first a plaything, then a luxury, by 1908 they were spreading throughout the land. The attention of the whole country was called to the absolute necessity of good roads. In 1916 congress passed an act appropriating approximately $85,000,000 to be paid in about five years to such states as would contribute equal sums for good roads. From this beginning the movement spread rapidly throughout the whole country.

The Trusts, 1914.—A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men." In June 1914, in a suit involving the International Harvester company, the United States supreme court upheld state antitrust laws.

Yet the trusts still flourished; and huge corporations, such as the U.S. Steel corporation, paid dividends on thousands of millions in stocks and bonds. President Wilson urged successfully a radical amendment of the Sherman act (Oct. 15, 1914) against discriminating freight agreements, interlocking directorates and holding corporations.

Another branch of the same attack on the money power was the Federal Trade commission, created Sept. 26, 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers.

In the same direction went the blue-sky laws passed in this period by many states, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere.

Labour, 1913–17.—The example of capital, in rolling itself into masses too great to be controlled by ordinary means, was followed by labour. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations. It did not undertake to call strikes, though it was likely to support them, and it had great effect in bringing about combined and simultaneous demands for the various items in the labour program. The leaders fixed upon an eight-hour day as the basic working time. The next item was the minimum wage, which made its way slowly and was not altogether acceptable to labour. Another demand was that U.S. citizens should have preference over aliens in employment. Labour in general was unfriendly to child labour and was, therefore, interested in a federal statute of Sept. 1, 1916, to prevent the transport of products made by child labour under specified conditions.

As the labour unions gained in numbers and strength they used their energies in favour of the closed shop, a system under which union men refused to work in any establishment where men not members of the union were also employed. From this idea rapidly developed the system of sympathetic strikes, in which members of one union back up another union by refusing to handle, use or transport products of nonunion labour. Hence boycotts, and perhaps ruin for employers who had no difficulty or quarrel with their own workmen. Never in the prior history of the U.S. had there been so many and so violent strikes as from 1913 to 1917. The I.W.W. organized long and tumultuous strikes among the silk weavers of Paterson, N.J., and the textile workers of Lawrence, Mass. In the trying years of 1916–17 violent strikes were directed not only against nonstriking workmen, but against the public peace. In July 1917, at Bisbee, Ariz., the tables were turned. A kind of vigilance committee seized and carried out of town, with orders not to return, about 1,200 striking miners and their friends. No jury would convict those responsible for this illegal action. The most serious of all these labour struggles was the threatened strike in 1916 of the large and very powerful unions of railway employees. President Wilson intervened and practically compelled congress to pass (Sept. 3, 1916) the Adamson act by which a basic eight-hour day was secured with pro rata for overtime. The supreme court upheld this statute, which went to the farthest verge thus far of the federal government's authority over labour matters.

Social Movements, 1913–17.—These struggles between the railways and the courts, between the trusts and congress, between labour and state governments, between strikers and the president of the United States, are part of U.S. history because they were vital to the welfare of the country. The farmers everywhere were aroused, for they looked on railways as hostile to their interests, by overcharging for carrying their products; and they resented the trusts, which they believed raised prices. The antiliquor forces steadily developed strength. They urged out-and-out prohibition and secured it in more than half the states. At the end of 1917 war prohibition was enacted by the federal government and also prohibition in the District of Columbia. On Dec. 19, 1917, a two-thirds majority was secured in congress for a prohibition constitutional amendment—the 18th amendment—which was at once submitted to the states. Woman suffrage also advanced steadily. Congress submitted a woman suffrage amendment in 1919. Thus changes that had been 50 years on the way finally were brought about by the force of public opinion. A change was also visible in the attitude of the country toward immigration which congress was determined to reduce by an intelligence qualification. A new bill (Feb. 5, 1917) was passed over Wilson's veto. Besides a literacy test it raised the head tax to $8 and excluded oriental labourers coming from certain geographical areas, which did not include Japan but did apply to Hindus and Malays.

Educational Progress.—The several years following 1909 were marked by a new sense of the possibility of general education, and the need for a more direct, searching and practical type of education. The country was accustomed to a system of graded public schools, offering the "common school education," and leading up to a few endowed and private schools, and to thousands of public high schools, which were expected to prepare the small proportion of young men and women who went on to institutions of higher education. Secondary education was subdivided into literary, commercial and industrial schools. The institutions of higher learning set up new professional departments, including the intensive study of education and separate schools of science, engineering, agriculture and other specialties. Private enterprise created a great number of so-called business colleges, and a few very efficient trade schools.

Nevertheless there was general complaint that the schools did not relate themselves to the life of the community. A National Society for the Promotion of Industrial Education became the focus of a movement to organize what now became generally known throughout the country as vocational education. A na-

tional commission was appointed by President Wilson, in 1914, to consider the whole subject. The resulting Smith-Hughes act (Feb. 22, 1917) created a federal board for vocational education which framed an elaborate plan for instruction in the four vocational fields of agriculture, commerce, industry and homemaking.

The act promised to appropriate federal funds to be paid to such states as would match these funds dollar for dollar.

Private enterprise accompanied this movement by building up advanced engineering and trade schools of a high type, such as the Carnegie institute at Pittsburgh; by improving the private commercial schools and by establishing advanced schools of business training in colleges. Some of the great manufacturers, especially of automobiles, set up schools within their own works.

When the United States plunged into World War I in 1917, the government established a variety of vocational schools to train men for the numerous specialties of military service. It made use of the shops and other vocational facilities of the existing schools and colleges. Great sums were raised by special drives among the alumni and friends of the endowed institutions, and the state universities were allotted hitherto unheard-of grants. The strictly vocational schools were admitted into fellowship with the other institutions.

Wilson's Foreign Policy.—Woodrow Wilson was naturally a man of peace, and so emphatically was Secretary Bryan. They set themselves to aid the cause of general peace by arbitration treaties. Secretary Bryan prepared a definite project for treaties by which the nations concerned should, in case of difficulties, pledge themselves to submit their grievances and claims to a special examining commission and to abstain from war or preparations for war until the commission should have had time to report. The presumption was that a sensible nation would submit to the judgment of an impartial tribunal. There was little difficulty in concluding more than 30 treaties upon this basis in the course of a year, but none was put into effect. The truth was that the American people, as a whole little accustomed to international questions, had no definite foreign policy.

Philippines and Caribbean.—The government of the Philippine Islands was altered by setting up the first Filipino assembly in 1907. In response to the pleading of President Taft, congress in 1909 grudgingly included them within the customs boundary of the United States. Under President Wilson, Gov. Gen. Cameron Forbes was withdrawn and Burton Harrison was appointed his successor, to carry out a policy of liberalization and preparation for independence. The Filipinos were allowed to hold a majority of the seats in the commission, which became a kind of administrative upper house. Filipinos were substituted for Americans in many of the civil offices. The people were thus given a definite opportunity to govern themselves. The Jones bill, enacted Aug. 29, 1916, greatly enlarged the power of the popular part of the government, and the commission ceased to exist. The act promised that the Filipinos should be given their independence when their ability to govern themselves should be demonstrated.

At the other end of the American sphere of influence, Cuba, while nominally independent, remained a protectorate of the United States. On March 2, 1917, the Puerto Ricans were for the first time made American citizens and received a popular government of two elected houses. President Wilson continued the administration of the Dominican republic which dated back to Roosevelt. He also took military control of Haiti in 1914, and followed it by a controlling treaty which was ratified by the senate (Feb. 28, 1916). He carried even further Taft's policy in Nicaragua by a treaty (ratified Feb. 18, 1916) which converted that country into a virtual protectorate. Another area came under control of the United States by a treaty for the annexation of the Danish West Indies proclaimed in 1917. These islands were duly organized under the title Virgin Islands of the United States. Little opposition was made to this creation of a virtual empire, including dependent provinces.

Latin America and the Orient, 1913–17.—The peaceful policy of the United States toward its neighbours was severely tested by disturbances in Mexico. In 1913 Francisco Madero, president of that republic, was murdered, presumably by order of V. Huerta, an insurgent officer, who thereupon declared himself the head of the state. The almost invariable policy of the United States had been to recognize any *de facto* head of a Latin-American government without inquiring into the source of his title. But on this occasion President Wilson adopted what he called a policy of "watchful waiting." He steadily refused to recognize Huerta against rival revolutionists. In April 1914 a trifling dispute arose at Tampico as to a salute of the U.S. flag and Wilson, apparently yielding to strong public sentiment, ordered the navy to attack and capture Veracruz, of which the United States remained in possession for several months. The real object was to discredit Huerta, who was compelled to flee the country. When in 1916 the brigand Francisco Villa raided Columbus, N. M., the president ordered a military expedition under Gen. John J. Pershing to advance into the interior of Mexico. It remained about eight months without capturing Villa or accomplishing any other definite result. The three friendly nations of South America—Argentina, Brazil and Chile, commonly known as the "ABC powers"—offered a kind of mediation. At their suggestion V. Carranza was recognized as president by the United States. Disorder continued, and in May 1920 Carranza was overthrown and killed by the troops of A. Obregon. For a time thereafter Mexico emerged from the state of revolution.

This long controversy was highly disturbing to the desired close relations with Latin America in general. In spite of four Pan-American congresses and several scientific congresses, in spite of visits of Roosevelt and of Root and Philander Chase Knox as secretaries of state to South America, there could be no harmony if the United States were to continue "administering" small and defenseless Latin-American nations and waging undeclared wars with Mexico. Nevertheless, President Wilson in a speech at Mobile, Ala. (Oct. 27, 1913), declared that the United States had no designs on the territory or independence of its Latin-American neighbours. Colombia, too, had a grievance arising out of the loss of the isthmus when the Panama canal zone was annexed in 1904. A treaty negotiated by Bryan to pay to Colombia $25,000,000 as a kind of reparation was ratified by the Republican administration in 1921.

In regard to the far east, Wilson had little opportunity to develop a policy. He began by disavowing the plans made under the advice of President Taft for a loan by U.S. bankers to China. He argued with the people of California because they insisted on passing a statute restricting alien ownership of land by Japanese residents. World War I soon united the United States and Japan in a common cause, and on Nov. 2, 1917, the Lansing-Ishii note, on the same plan as the Root-Takahira note of 1908, set forth that the United States recognized Japan's "special interests in China."

Neutrality.—The United States in 1914 expected to remain indefinitely at peace, as was shown by lack of anything that could be considered national military preparation in terms of modern warfare. When, on Aug. 4, 1914, President Wilson issued a proclamation of neutrality as between the two groups of European nations just engaging in a gigantic struggle, the authorized military establishment was about 107,000 men, of whom about 87,000 were enrolled. The United States had not one military aeroplane of approved type; had only four modern heavy field guns and no transport for them; had not a trench bomb or a mine thrower; nor considerable supplies of any weapons or equipment except 800,000 excellent rifles; nor any officers experienced in the kind of warfare used in modern wars; nor any instruction camps for officers or men. The navy included a fleet of battleships recently built, but it was weak in small and swift vessels and particularly in submarines. The militia proved to be of little service, though Secretary Bryan publicly declared that the nation needed no preparation, for it "could raise a million men between sunrise and sunset."

Neither the foreign policy nor the diplomatic organization of the United States was fitted for such a crisis. The traditional Monroe Doctrine was expected to keep the nation out of dan-

gerous controversies with the other American states. The counterpart principle of isolation forbade the United States to take any part in European crises or wars. As a neutral it stood by the principle of "freedom of the seas," by which was meant in particular the right to carry on commerce with all belligerents in case of war, subject to the limitations of the then acknowledged international law as to contraband and blockade. Soon after the beginning of World War I relief was organized on a large scale for the Belgian people, most of whose country was overrun and held by the Germans. This system soon included French refugees, the unhappy peoples of Serbia and Asia Minor and other combatant or noncombatant sufferers, besides the sick and wounded of the contending armies.

Difficulties with the Belligerents, 1914–17.—The United States was compelled at once to take into account the relation between the war and U.S. industries, commerce and finance. Heavy loans were placed in the United States by Great Britain, France and Russia. As fast as the money was borrowed it was spent in the United States for the purchase of food, clothing, animals and especially munitions. President Wilson issued a proclamation (Aug. 18, 1914) advising that the people remain neutral "not only in act but in word and in thought." Such neutrality was impossible. In the first weeks of the war, German commerce was driven from the seas. The command of the sea by the Allies very nearly cut off trade of any kind between the United States and Germany and Austria, while commerce continued in ever-increasing volume with England and France. This disparity led to protests on the part of the German government, and also to lawless acts perpetrated or directed by agents dispatched by the German government for the purpose of paralyzing the munition factories. Violent antipathies were caused by the German methods of carrying on war, and particularly the treatment of the occupied areas of Belgium and France. The American population included hundreds of thousands of citizens of the belligerent countries, many of whom attempted to return to their homes in order to serve in the army. The road for such recruits was blocked for the Germans and their allies, but open to the Allies. For the first time in half a century the United States found within its own borders a sharp division on questions of foreign policy.

On the other hand, the war trade brought immense profits. The favourable balance of trade rose from $690,000,000 in 1913 to $1,770,000,000 in 1915 and $3,000,000,000 in 1916. This prodigious debit was balanced by about $3,000,000,000 sent to the United States in securities and gold, besides $2,000,000,000 in foreign war bonds. Under these circumstances genuine neutrality was out of the question. A decided preponderance of sympathy developed toward the western Allies, who were profitable customers, were in close and almost undisturbed intercourse with the United States and were considered to be fighting against a ruthless, arrogant and dangerous autocracy.

International Controversies, 1914–17.—The internal tension of the United States was tightened by the insistence of Germany on the right to use new weapons, tactics and practices of war, without the traditional limitations of international law, without mercy to noncombatants, on the basis of "a law of necessity." No able-bodied German man or woman was really a noncombatant; the Germans insisted that they must regard all civilian enemies as combatants. There was no way to stop them without using similar new methods of warfare.

Great Britain, which in the London Maritime conference of 1908–09 had shown some disposition to enlarge the privileges of neutral commerce, now seized U.S. ships and shipments, and arbitrarily extended the list of contraband, until (Dec. 26, 1914) a dispatch signed by Secretary Bryan, but expressing the conclusions of President Wilson, made a protest. In the course of 1915 the British government began to apply the U.S. principle of "continuous voyage" as applied by the United States during the Civil War to cover shipments to neutral ports in cases where those shipments were likely ultimately to reach Germany; and also where they might replace products of the neutral countries that could thus be spared for Germany; or if the neutral countries declined to make a hard and fast agreement not to reship.

In 1916 the British were practically blockading neutral European ports and capturing vessels, U.S. and other, wherever they liked. The Central Powers set up a new war practice of using submarines as commerce destroyers. The U.S. government protested. A crisis came through the sinking by a submarine of the British passenger liner "Lusitania" (May 7, 1915), with the loss of 139 American lives. That sinking seemed a deliberate act of the Germans to test the temper of the United States. Apparently they were greatly surprised when the people of the United States rose in resentment. President Wilson, who had earlier insisted on "strict accountability," insisted on a sharp protest. Bryan thought milder measures sufficient, and on that issue resigned the secretaryship of state (June 8, 1915), being succeeded by Robert M. Lansing. The correspondence went on until October when Germany at last informed the U.S. government that merchant ships would not be sunk without warning and an opportunity to save noncombatant lives. Meanwhile, throughout 1915 and 1916, systematic violations of the neutrality laws of the United States by Germans and Austrians caused the dismissal of the Austrian ambassador to the United States and of the two most obnoxious members of the German ambassador's staff.

"Preparedness."—By the end of 1915 it became clear that with or without their own desire, the people of the United States might find themselves involved in the war. President Wilson desired peace. A day or two after the sinking of the "Lusitania" he spoke of there being such a thing as "a nation that was too proud to fight." In his message of Dec. 1915 he urged national defense and the protection of American shipping. Long before this time World War I had brought about a violent change in the economic conditions of the country. The great demand for foodstuffs raised the price of grain and other farm products. The high cost of living became a political issue. The munition factories offered unheard-of wages and drew hundreds of thousands into improvised towns. The war caused a great change in immigration. Hundreds of thousands of men left the United States for Europe, while the net immigration fell from 1,200,000 in 1914 to 300,000 in 1916.

The Election of 1916.—In the midst of this turmoil and confusion of business came the preliminaries of the presidential election of 1916. President Wilson carefully abstained from taking sides between the Allies and the Central Powers; but the aggressive submarine policy of Germany provoked a much sharper tone than did the aggressions by the English. He felt the need of caution, particularly because a growing group of men, among them Roosevelt, were coming to the conclusion that eventually the United States would have to join in the war.

The Republican nominating convention met in Chicago, June 7. A strong effort was made by friends of Roosevelt to capture the Republican convention, but the standpat Republicans had control of the party machinery. The Progressives—who in Nov. 1914 had cast 1,800,000 votes for congressional and state candidates—also met in convention in Chicago. Their purpose was to compel the Republicans to nominate Roosevelt as the only means of healing the breach. That effort failed: the Republicans nominated Justice Charles E. Hughes of the supreme court, who had been a reform governor of New York state. The days of the Progressive party seemed numbered.

In the Democratic convention (June 14) there was practically no opposition to Wilson and his running mate T. R. Marshall. The platform in many respects was similar to that of the Republicans. Both favoured woman suffrage, the conservation of national resources and national enforcement of child-labour laws; both reaffirmed the Monroe Doctrine. But the Democrats upheld tariff for revenue only; they endorsed the promise of ultimate independence to the Filipinos; they commended the establishment of a federal trade commission; and they approved a merchant marine owned and operated by the federal government. In the campaign Roosevelt publicly supported Hughes, though it was well-known that he felt no enthusiasm for him. The only slogan that caught the public ear was favourable to Wilson: "He kept us out of war." Wilson received about 9,000,000 popular

votes against 8,500,000 for Hughes, and was chosen by a close vote in the electoral college.

ENTRY INTO WORLD WAR I

President Wilson stood in a strong position in the United States and in the world. He had been re-elected. His policy was approved. He felt that he had the nation politically united behind him. He hoped that the one great neutral nation might bring about peace. On Dec. 18, 1916, he sent a communication to the warring powers suggesting that they come to an understanding of each other's demands. On Jan. 22, 1917, in an address to the senate on foreign affairs, the president described the replies he had received to the identic note of Dec. 18.

The Central Powers united in a reply which stated merely that they were ready to meet their antagonists in conference to discuss terms of peace. The Entente Powers have replied much more definitely, and have stated, in general terms indeed, but with sufficient definiteness to imply details, the arrangements, guarantees and acts of reparation which they deem to be indispensable conditions of a satisfactory settlement.

He went on to speak of an "organized common peace," and of a "peace without victory"; he outlined the principle of self-determination, declaring that "Governments derive all their just powers from the consent of the governed," and that "no right anywhere exists to hand people about from potentate to potentate as if they were property." The German answer was a brief note communicated by Ambassador Count von Bernstorff to Secretary Lansing (Jan. 31, 1917), withdrawing the pledge given in Oct. 1915 and renewed in May 1916 that merchant ships would not be sunk without preliminary warning and announcing that the Germans would shortly resume unrestricted submarine warfare. High military authority in Germany believed that Americans would never sacrifice the large profits of export trade and incur the huge expenses of war merely for the sake of a question of neutral maritime rights.

Immediate steps were taken to make the U.S. navy ready for war. For a time the president dallied with a plan of arming merchant ships. One result of the controversy was the adoption by the senate (March 8) of a mild and cumbrous method of cutting short debate by closure. During Feb. and March 1917 a few U.S. vessels were torpedoed by German submarines. On March 1 the government published an intercepted German dispatch to the Mexican government asking it to join in the war, promising it the "former Mexican provinces," long incorporated in the United States. The participation of the United States in the war was now inevitable. A formal declaration of a state of war was signed by the president (April 6) after a house vote of 373 to 50 and a senate vote of 82 to 6, which stated that war had already been begun by Germany. Relations with Austria and Turkey were at once broken off, but the declaration of war with Austria was delayed until Dec. 7 and no declaration was ever made against Turkey or Bulgaria.

The breach with Germany was a spontaneous national action representing a national belief that the United States could no longer live in peace with such a nation as Germany had become. As President Wilson put it the war was to make the world "safe for democracy." Moreover, there was widespread sympathy with the three western powers, France, Belgium and Great Britain, which were closest to the United States in their political principles and system of government. Wrath was aroused by the German treatment of the people of Belgium and other conquered countries. In some minds there existed a genuine and well-grounded fear of a future attack upon the United States by Germany if the resistance of the Allies should be destroyed. Amid all the motives for the war, the one thing was that the American people recognized Germany as an enemy, and the enemies of Germany as natural friends and partners in the great enterprise of subduing "the Hun."

War Measures.—Passionate national spirit, patriotism and urgent reasons for war were all useless unless the United States could enrol, train, equip, convey and continuously supply an immense army. The U.S. navy, though the vessels were good and the crews skilled and well commanded, was in no position to give direct aid in the process of destroying the German army. What was most needed was to raise and convey to the fighting front a large force of U.S. troops.

Soon after the declaration of war by the United States, missions from the various Allied countries were sent to America. The British mission, headed by Arthur (later Lord) Balfour, British foreign secretary, reached Halifax April 20 and proceeded to Washington. The French mission, headed by René Viviani, the former premier, and including Marshal Joseph Joffre, landed April 24. Other missions came from Italy, Belgium, Russia, Rumania and Japan. The United States was able at once to help the western Allies in their pressing financial difficulties. Taxes were low and little felt; money abounded. Under acts of congress beginning Oct. 17, 1917, the Allies received essential credits, which amounted eventually to $9,500,000,000.

These enormous payments were made possible by the Liberty Loans. In June 1917, 4,000,000 people joined in offering $3,000,000,000 to the government; and at the end of World War I the interest-bearing debt had increased from $972,469,290 on Dec. 31, 1916, to $25,234,496,274, on June 30, 1919. These loans were supplemented by the War Revenue act (Oct. 17, 1917) and later statutes, which laid a variety of new taxes, increased the income tax heavily and combined with it an excess-profits tax to bring into the treasury unreasonable profits likely to be made in the war industries.

All traditional limitations on raising an army were discarded. On May 18 the Selective Service act was passed which provided for the enlistment of 1,000,000 men by "selective draft." When called up, the men had to be clothed, housed, fed and drilled. Thousands of officers were necessary, and training camps, both for men and officers, were established on a vast scale. In May 1917 a few U.S. destroyers reached England. On June 9 General Pershing, who had been selected as commander in chief, arrived in England. On June 26 a small detachment of United States troops reached Europe. New branches of military service were established, among them the chemical warfare service which provided materials for lethal gases and for gas masks and other means of resisting the enemy attacks. Congress, on July 24, appropriated $640,000,000 for aviation. By August about 700,000 men were enrolled in the army and 230,000 in the navy.

Control of Industry and Transportation.—The establishment of huge war industries put a great strain on the industry and transportation of the United States. On Aug. 10, 1917, a Food Control act gave the president powers never before conferred with regard to food and fuel. Herbert C. Hoover of California, who had distinguished himself in the management of the Red Cross in Europe, was made food administrator with large powers. Before World War I ended he had established "meatless" and "wheatless" days; the price of grain was fixed; eventually the farmers were assured $2.20 a bushel for their wheat crops. H. A. Garfield, fuel administrator, carried through drastic measures for stimulating the production of fuel, regulating shipments and distributing supplies. On March 21, 1918, the Federal Control act placed the management of all the railways in the country in the hands of the government during World War I, and for a period after its close. W. G. McAdoo, secretary of the treasury, was made director-general of the railways; later Walker D. Hines, an experienced railway man, succeeded him. One of the most serious needs of the times was a merchant fleet adequate to carry across the Atlantic the army and its supplies. The government undertook the great task of improvising such a fleet, and vast construction was authorized in both steel and wood.

War Activities at Home.—At once after the declaration of war the American people through official and unofficial channels gave support by civilian service and money contribution. Among the multifarious public agencies was a committee on public information, of which George Creel, journalist, was chairman, which kept up a lively system of publicity aided by the National Board for Historical Service. A censorship board censored all communications—mail, cable, radio—passing between the United States and foreign countries. As early as Aug. 29, 1916, the Council of National Defense was created by act of congress. Under it were

created numerous special organizations. The Council of National Defense appointed a women's committee to co-ordinate the patriotic work of the women throughout the country. The advisory commission of the Council of National Defense created a committee on transportation and communication. A railroad war board undertook to secure unity of operation among all the railways, to subordinate private interests and to eliminate competition. Important coastwise steamship lines were added to this system. In 1918 the government assumed control of telegraph, telephone, marine cable systems and radios. Many scientists were engaged in research throughout the country under the National Research council. Commerce also was regulated.

By the Espionage act of June 15, 1917, the president was empowered to control exports, and he created a bureau of export licences and a trade board. A list was prepared of firms throughout the world with whom Americans should not trade. The government formally took charge of all foreign trade Feb. 15, 1918, and seized all German ships interned in United States ports.

Samuel Gompers, president of the American Federation of Labor, co-operated in organizing a committee on labour, and a mediation commission was appointed. The National War Labor board (April 9, 1918) acted throughout the country as a kind of "supreme court" to settle labour disputes. For the recruiting of essential labour and directing it into necessary industries a U.S. employment service was created.

Several private war agencies were established. Chief among these were the American National Red Cross, which was to be found wherever there was fighting, sickness, suffering or starvation; the Y.M.C.A.; Y.W.C.A.; Knights of Columbus (Catholic); Salvation Army; Jewish Welfare board; American Library association; and War Camp Community Service.

Enemies in the United States.—While the people of the United States were practically a unit in favour of a vigorous prosecution of World War I, a few, chiefly foreign-born or sons of foreign-born, were opposed to the war or more often to the nations in concert with which the United States was fighting. Ever since 1914 the country had been irritated and aroused by a series of illegal, violent and often murderous acts which were traced to German and Austrian agents. Such were determined efforts to blow up the international bridge at Vanceboro, Me., and the locks of the Welland canal, Ont. Bopp, German consul general at San Francisco, Calif., was convicted and imprisoned for aiding German vessels in the Pacific in defiance of neutrality laws. Franz von Rintelen (after the war specially rewarded by the German government) was sent to the federal prison at Atlanta, Ga., for aiding in placing bombs on outgoing vessels with intent to destroy them.

The Navy.—Beginning with patrol work on the American coast as soon as war was declared, the activities of the United States navy extended to co-operation with the British and French in the hunting down of submarines and the protection of convoys and in the laying of the North sea mine barrage, extending from the Orkneys to Norway. The U.S. navy had some part in blockading the Austrian coast of the Adriatic, and it participated in maintaining that Allied command of the sea which in the end was fatal to Germany. By a remarkable convoy system more than 2,000,000 troops were carried safely 3,000 mi. overseas to France. In this work the utmost secrecy was necessary. In June 1917 a few cruisers and transports were provided and the first troops sent across. At intervals vessels assembled and sailed on definite routes under the protection of destroyers. According to the report of the secretary of the navy (1920), 911,047, or nearly half of the U.S. troops, were carried on United States navy transports; the rest chiefly by the British. Not one eastbound U.S. transport was torpedoed by the German submarines; and only three ships were sunk on their return voyage. Three small fighting ships were destroyed by the enemy.

During the campaign of 1918 efforts were made to extend the possible field of enlistment by the passage of the Man Power act of Aug. 27. All men between 18 and 45 were required to register with a view to service if needed, and 11,000,000 were registered. By a statute of Oct. 6, 1917, provision was made for a system of military and naval insurance available for all men in the service.

(A. B. H.; X.)

The American Expeditionary Force.—When Gen. John J. Pershing, commander in chief of the American expeditionary force, departed for Europe on May 28, 1917, America's military defensive forces comprised a regular army of approximately 80,000 and a national guard of less than 150,000. While the regular army was well officered and trained as regimental units, the national guard was not adequately organized nor sufficiently trained. Industry was not prepared for its part and no authority for raising national armies had been enacted. Consequently, the nation found itself faced with the problems involved in providing manpower and organizing, financing, equipping and transporting overseas an enormous army and organizing a theatre of operations—all before Germany could strike decisively on the western front. With her small unprepared forces as a nucleus, the United States called into army service 4,000,000 men, sent overseas 2,086,000 in 19 months, averaging in the summer of 1918 about 10,000 men per day. The first contingent comprised the regular army 1st division and some special troops which landed in France at the end of June 1917. The peak of the troop shipment was reached in the summer of 1918, when more than 300,000 men landed in one month. More than 50% of the U.S. forces were carried in Allied ships. In addition about 7,500,000 tons of supplies were shipped from America to France, practically all in U.S. ships. The tasks involved in these problems were both intricate and gigantic.

Upon America's entry into World War I, German hopes of final victory cannot be said to have been extravagant. The Allies were embarrassed financially and through lack of supplies. Losses had been tremendous and resources in manpower were so low that there was little prospect of materially increasing their armed strength even in the face of the probable concentration on the western front of practically the whole German military strength in the spring of 1918. A review of the conditions then existing made so apparent the early necessity for a supreme effort that General Pershing cabled Washington on July 6, 1917: "Plans should contemplate sending over at least 1,000,000 men by next May." Upon completion of his study on July 11, 1917, he reported: "Plans for the future should be based . . . on at least 3,000,000 men." By the middle of Oct. 1917, General Pershing had completed his basic plans for the operation of the U.S. army in Europe. These included the training of the combat army, the organization of supply in Europe, a priority for shipment from the U.S. of troops and supplies, and a project for the army's strategical and tactical employment.

The U.S. mission was offensive. The plans were based on striking where a definite military decision could be gained. While the Allied armies had endeavoured to maintain the offensive, the British, in order to guard the channel ports, were committed to operations in Flanders and the French to the front protecting Paris. Both lacked troops to operate elsewhere on a large scale. A deep advance east of Metz, or the capture of the Briey region, by threatening the invasion of rich German territory in the Moselle valley and the Saar basin, and curtailing her supply of coal or iron, would have a decisive effect in forcing a withdrawal of German troops from northern France. The military and economic situation of the enemy and the Allies indicated Lorraine as the field promising most fruitful results and in Sept. 1917 it was selected by General Pershing as the area for the decisive operations of the U.S. army. These plans contemplated a reduction of the St. Mihiel salient followed by a decisive blow based either on Verdun or on Nancy. The organization of the immense U.S. supply service accorded with this strategical conception. The complexity of trench life had enormously increased the tonnage of supplies required by troops. Not only was it a question of providing food but enormous quantities of munitions and material. Upon the railroads of France fell the burden of meeting the heavy demands of the 3,500,000 Allied combatants. If the U.S. army was to have an independent and flexible system it could not use the lines behind the British-Belgium front nor those in the rear of the French front covering Paris, for these were needed for the

British and French forces respectively. The problem confronting the American expeditionary forces was then to superimpose its rail communications on those of France where there would be the least possible disturbance to the existing arteries of supply. These controlling factors led to the organization of base ports along the southwest coast of France and the utilization of French railways passing mainly south of Paris.

For all practical purposes the American expeditionary forces were based on the American continent. Three thousand miles of ocean to cross with a growing submarine menace, an uncertain quantity of ship tonnage available and a land line of communications in France 400 mi. long presented almost insurmountable difficulties. The system developed in France included U.S. construction of 83 new ship berths, about 1,500 mi. of new railway with shops and roundhouses, 4,000 km. of telegraph and telephone lines with the operation of a 215,500-km. system; 1,500 locomotives and 20,000 freight cars were brought over and U.S. engineers repaired 2,000 French locomotives and 58,000 French freight cars. Daily tonnage at ports increased from 17,000 in July to 45,000 in Nov. 1918. Commanded by Maj. Gen. James G. Harbord, this great supply system engaged more than 650,000 persons by Nov. 11, 1918.

The problems indicated were complicated by those necessarily involved in the association of the U.S. commander with Allied governments and commanders. The outstanding problems related to the persistent Allied proposals for the amalgamation of the Americans in the British and French ranks. This General Pershing consistently and successfully opposed; he favoured unity of U.S. command; adherence to the American doctrine of open warfare training and the primary value of the rifle and bayonet.

In meeting the crises caused by the German offensives in the spring and summer of 1918, U.S. troops (combat and service) were frequently employed with decisive results under Allied command. The 1st division's successful Cantigny operation near Montdidier, in May, demonstrated American fighting qualities. The 2nd and 3rd divisions in June blocked the German advance on Paris by holding the line about Château Thierry. The 3rd and 42nd divisions held a vital part of the line against the German attack of July 15. The successful Allied counteroffensive of July 18 was based on the decisive blow delivered south of Soissons by the 1st and 2nd U.S. divisions with the 1st French Moroccan division between them. Thus the U.S. arms were in time to assist in crushing the last offensive of the enemy and to commit him entirely to the defensive.

After these divisions cut the main German communications in the Marne salient, the 3rd, 4th, 26th, 28th, 32nd, 42nd and 77th U.S. divisions joined the French in driving the enemy out of the salient and across the Vesle river. At the same time some divisions were holding sectors in the Vosges and others were training as reserves behind the British and even participating in British operations. About 20,000 aviation specialists were working in England and more than 11,000 motor mechanics were helping the French in addition to several thousand engineers, medical, hospital and other specialists.

The successful counteroffensive of July 18 against the Marne salient showed that the emergency which justified the dispersion of U.S. divisions had passed. By July 24 Marshal Ferdinand Foch accepted General Pershing's proposal for the organization and operation of an independent U.S. combat army and the execution of the U.S. plan of the previous September. Accordingly, early in the morning of Sept. 12 the U.S. 1st army, 550,000 strong, supported by 110,000 French troops, attacked the St. Mihiel salient and within a few hours had attained its objectives. Following out a prearranged plan, the Americans were immediately transferred to the Meuse-Argonne zone where they began operations on Sept. 26. In the fighting which followed the Americans (24 U.S. and 7 French divisions) drove the Germans from their strongly fortified positions and captured the heights commanding Sedan; only the Armistice saved the 5th German army from complete destruction. The Germans had employed one-fourth of their divisional strength (62 divisions) to meet the attack. (For full particulars of these two battles *see* ST. MIHIEL; MEUSE-ARGONNE OPERATION.)

During these purely American battles, other U.S. troops and services continued to operate under Allied command, such as the troops of two divisions who assisted the British to break the Hindenburg line at Le Cateau in Sept. 30–Oct. 1; the two divisions with the 4th French army capturing Mont Blanc and advancing toward the Aisne in early October; two divisions with the 6th French army in Flanders in late October and early November driving the enemy across the Escaut and the Scheldt rivers. In addition, a regiment of infantry with auxiliaries assisted the Italians on the Piave in the fall of 1918 and another regiment and auxiliaries joined the Allies in the Russian Archangel expedition of 1918–19.

Thirteen major operations in which Americans participated:

Operations	Approximate number of Americans engaged
West front—campaign of 1917:	
Cambrai, Nov. 20–Dec. 4	Detachments
West front—campaign of 1918:	
German offensives, Mar. 21–July 18:	
Somme, Mar. 21–Apr. 6	2,200
Lys, Apr. 9–27	500
Aisne, May 27–June 5	27,500
Noyon-Montdidier, June 9–15	27,000
Champagne-Marne, July 15–18	85,000
Allied offensives, July 18–Nov. 11:	
Aisne-Marne, July 18–Aug. 6	270,000
Somme, Aug. 8–Nov. 11	54,000
Oise-Aisne, Aug. 18–Nov. 11	85,000
Ypres-Lys, Aug. 19–Nov. 11	108,000
St. Mihiel, Sept. 12–16	550,000
Meuse-Argonne—Sept. 20–Nov. 11	1,200,000
Italian front—campaign of 1918:	
Vittorio-Veneto, Oct. 24–Nov. 4	1,200

The Armistice.—The campaign of 1918 was the final effort of the Germans. No one can say that the U.S. army in the field was the chief element that ensured victory, but there is not a doubt that the triumphant success in raising and transporting incessantly troops, provisions and supplies was to the German mind convincing and disheartening evidence that the government and the people of the United States, with all their power and potentiality, would stand by the Allies indefinitely. On Nov. 11, 1918, by the Armistice in which the U.S. armies shared, the Germans admitted their defeat and at once began to evacuate the occupied regions and also portions of their own national territory.

In accordance with the terms of the Armistice, the Allies were to occupy all German territory west of the Rhine. The zone assigned the U.S. command was the bridgehead of Coblenz and the district of Trèves. This territory was occupied by the U.S. army with its reserves held between the Moselle-Meuse rivers and the Luxembourg frontier. The advance toward German territory began on Nov. 17, 1918, and, passing through Luxembourg, crossed the German line on Dec. 1.

Shortly after the signing of the Armistice, the U.S. commander formulated plans for the early return of the U.S. forces to America. Rearrangement of base port and rail facilities, securing additional ships and the demands of the Allies for considerable U.S. forces to remain in France, necessarily presented important considerations. Beginning, however, in December, a continuous flow of returning troops was maintained and by May 19, 1919, all combat divisions, except five still in the army of occupation, were scheduled to sail by July. The remaining troops, less a permanent force of one regiment of infantry and certain auxiliaries, were released in Aug. 1919. (J. J. P.)

AFTER WORLD WAR I—TO 1926

Rehabilitation, 1919.—The task of *post bellum* economic adjustment was long and costly. At the end of the war the federal government by means of war statutes was attempting to control the distribution of food, was in fact limiting and rationing manufactured goods and was continuing to direct mining of

coal and its shipment. The government was directing the operation of railways, and the telegraph and telephone services. It had taken over the property of aliens through an alien property custodian. For foreign commerce there was still the Shipping board, the Emergency Fleet corporation, the War Trade board and the War Finance board. Two million U.S. soldiers were overseas and wanted to come home as soon as possible. The United States had spent on the war about $35,500,000,000, including $9,500,000,000 lent to the Allies. Expenditures after peace came continued on a scale far beyond any previous experience of the country.

In the course of six months after the Armistice, about two-thirds of the troops were brought back, leaving behind them enormous stores, large parts of which were sold at heavy discounts to European governments. On June 1, 1920, the only U.S. troops left in Europe were an army of occupation in western Germany.

The Election of 1918.—The Armistice had come a few days after the state and congressional elections of the autumn of 1918. Despite the deep political and sectional divisions in both the Republican and Democratic parties that had preceded the declaration of war in 1917, the nation had been a unit in waging war. Partisan politics did not enter into the organization of the armed forces. Little attention was paid to politics in the civilian administration of the war. Yet the administration of the president was subject to constant attack by prominent Republicans and by Republican members of congress, and in Jan. 1918 the Republican national committee began a campaign to capture control of congress in the autumn elections.

A few days before the elections, President Wilson issued a circular letter urging the voters to return a Democratic majority to the senate and the house. The result of the election, however, made the new house decidedly Republican and the senate Republican by two votes. It was apparent, therefore, that the administration in making the necessary adjustments after the war had to take into account the preponderant opposition in both houses of congress.

Throughout 1918 the influence of Theodore Roosevelt in the Republican organization was manifestly growing. It became clear that he would wield great influence in the Republican convention of 1920 and might be chosen as candidate of the party, despite his defection in 1912. But he died suddenly on Jan. 6, 1919.

The Peace Conference.—In Dec. 1918 President Wilson decided that he would attend the forthcoming peace conference in person, and designated as peace commissioners Secretary of State Lansing, Col. Edward M. House of Texas (his most intimate friend and political adviser), Gen. Tasker Bliss of the army and Harry White, formerly minister to France. Wilson was one of the representatives of the four great powers—Great Britain, France, Italy and the United States—who prepared the articles of the treaty of peace.

A part of the treaty was the covenant of the League of Nations, a crystallization of long-debated suggestions for a world confederation of states. President Wilson was deeply interested in the foundation of such a league as was envisioned in the covenant, and was willing to agree to a suggestion of the French for a treaty of mutual protection in order to gain the support of the French for the proposed covenant.

U.S. Action on the Treaty, 1919.—It had been apparent during the course of the negotiation of the treaty that in the U.S. congress and electorate there would be vigorous debate on the covenant of the League and, indeed, upon the question of U.S. membership in such a league. President Wilson returned home for a short stay (Feb. 24–March 4), defending the general terms of the treaty and the covenant. On June 28, 1919, he and his four commissioners signed for the United States the formal treaty of Versailles, including the covenant of the League, which was so interwoven into the text of the treaty that it was impossible to ratify one without the other. The treaty had many powerful supporters among all parties, particularly former President Taft, the League of Free Nations association and the League to Enforce Peace. The senate was divided into strongly opposed groups. Most of the Democrats, under the lead of Sen. Gilbert Hitchcock (Neb.), followed the president in favouring the treaty with the covenant as it stood. A group of Republicans, headed by Sen. Henry Cabot Lodge of Massachusetts, favoured "amendments" to the treaty and "reservations" to the League. Another group desired reservations that would practically destroy both. A small group, including Sen. William Borah of Idaho and Sen. Hiram Johnson of California, were against both the treaty and the covenant in any form or with any reservations.

The contest ostensibly centred about article x of the covenant, under which the members of the League undertook "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." The implacable group expressed fear lest the United States be drawn into foreign wars and insisted that "no American soldiers or sailors must be sent to fight in other lands at the bidding of the League of Nations." The president, on the other hand, regarded article x as the heart of the whole treaty. He declined at the critical moment to accept either amendments or reservations, except certain minor alterations. After strenuous debate and by a test vote, Nov. 19, 1919, the senate refused to ratify the peace treaty with reservations—the vote being 53 to 38 in favour, but not the necessary two-thirds. In the regular session upon resubmission, the vote was 49 to 35, again not the necessary two-thirds. Thus after five months' discussion the treaty was rejected, and the United States was left in the situation of remaining technically at war with Germany and Austria though all hostilities had ceased a year before.

President Wilson, believing that he could arouse public sentiment to force senate ratification, had undertaken a tour of the country in September. He was greeted by great audiences, but the response of the country was not convincing. Not only did senate opponents speak before great audiences in rebuttal, but it was apparent in public discussion that many elements in the population were pledged to U.S. "isolation" from Europe.

The president's tour was abruptly ended when he collapsed, in Colorado, and a paralytic stroke in October removed him for months from active participation in work of the government.

On March 4, 1921, Wilson accompanied President-elect Warren G. Harding to the capitol as the last act of his official life. Wilson had been president for eight years, during six of which he was the undisputed leader of his party. He was responsible for important revenue, banking and labour laws. He had a great hold on millions of citizens. For a time in Paris he was the foremost man in the world, and he succeeded in inducing foreign statesmen to accept the League of Nations. At the height of his career he lost the prestige gained as war president of the whole country, was no longer fully accepted by his party and ceased to be the one man who could appeal from congress to the people. He lived in Washington in retirement, physically unable to take part in public affairs, and died Feb. 3, 1924.

Presidential Election of 1920.—The peace revealed underlying elements of dissatisfaction. The soldiers received in many states a money bonus and an organized lobby demanded a bonus from congress. The general public complained bitterly against the rising cost of living. A multitude saw their incomes and expectations reduced by the fall in the purchasing power of the dollar. As the presidential election opened, the Democratic party was paralyzed by internal dissensions over the peace treaty and by lack of leadership of the president; it had no accepted policy in foreign relations or reconstruction and no commanding figure to put forward for the presidency.

The Republicans were rent by personal rivalries. Gen. Leonard Wood, Gov. Frank Lowden of Illinois and Sen. Hiram Johnson of California were outstanding candidates. The convention at Chicago (June 9, 1920) passed them all by, and gave the nomination to Sen. Warren G. Harding of Ohio. He was backed by a strong group of standpatters. Calvin Coolidge, governor of Massachusetts, was put on the ticket as vice-president. The Democratic convention held at San Francisco was confronted with similar difficulties. The nomination went to Gov. James Cox of Ohio, a man little known in national affairs, with Franklin D. Roosevelt

of New York, who had served as assistant secretary of the navy, as candidate for the vice-presidency. In the campaign for the first time women were eligible to vote in every state. The election was a complete triumph for the Republicans, who elected Harding by a popular majority of about 7,000,000, and an electoral majority of 404 against 127 for Cox, besides securing solid majorities in both houses of congress.

The presidency was thus transferred to a man little experienced in national politics, whose task it was to take over the discordant elements and build out of them a coherent policy. President Harding began his administration under favourable auspices, although several members of his cabinet had been chosen in the face of strong opposition from various quarters. The new president displayed keen interest in all attempts to restore business to a sound basis and urged prompt action in the assistance of the railways. By nature conservative, he laboured to bring the country back to a state of "normalcy."

Harding's foreign policy was to remain outside the League of Nations. Special treaties of peace negotiated with Germany, Austria and Hungary were ratified by the U.S. senate Oct. 18, 1921. Of world-wide importance was his call for a conference at Washington of the different powers bordering on and interested in the Pacific ocean, to discuss both questions of the Pacific and the limitation of armaments. The conference assembled Nov. 12, 1921, and closed Feb. 6, 1922. The nine participants were the United States, Great Britain, France, Italy, The Netherlands, Belgium, Portugal, China and Japan. Important agreements were signed: to limit construction of capital warships; against improper use of submarines; against gas warfare; for maintenance of the status of Pacific insular possessions; and other questions involving relations with Japan and China (*see* WASHINGTON CONFERENCE).

Before Harding came to the presidency, two constitutional amendments had crystallized some of the results of the war. The various prohibition measures passed by the congress led finally to passage and ratification of the 18th amendment. The service of women in the war, together with the votes they already enjoyed, caused congress (June 7, 1919) to submit the 19th constitutional amendment annulling all restrictions of sex on suffrage. It received the ratification of the 36th state on Aug. 24, 1920, and went into force Aug. 26.

Political and Social Conditions, 1921–26.—A study of the political, social and economic history of the United States must take account of the extraordinary national elation following World War I. It produced a profound effect upon the national mind and was the beginning of an enlargement of national life in every direction. The nation felt free to expand its influence in the Caribbean and the Pacific. Hence the maintenance and enlargement of a policy of paramount interest in the three normally independent countries—Cuba, Haiti and the Dominican Republic, and a strengthening of the control over Panamá, Honduras and Nicaragua.

To carry out great national policies, the United States could call upon a population expanding from year to year. The total continental population rose from 92,000,000 in 1910 to 106,000,000 in 1920. Net immigration of 818,000 in 1910 sank to 19,000 in 1918, but rose in 1924 to 663,000. The wealth of the country, estimated at $187,000,000,000 in 1912 was counted at $321,000,000,000 in 1922, and was still swelling in volume. Against these figures, such burdens as a national debt of $25,000,000,000, bearing $1,000,000,000 of annual interest, besides $6,000,000,000 of state and municipal debts were insignificant. Manufacturing, transportation, mining, distribution and financial business were all prosperous.

Political rancour and party spirit diminished during these years. President Harding drew several strong men into his cabinet in March 1921. Secretary of State Hughes had been a justice of the U.S. supreme court and candidate for the presidency in 1916. Secretary of the Treasury Andrew Mellon was a successful banker and financier who had never before appeared in public life. Herbert Hoover, secretary of commerce, contributed his extraordinary gift of business organization. Henry C. Wallace, secretary of agriculture, was the editor of a great agricultural newspaper. President Harding's career was cut short by a very brief illness, however, and he died in San Francisco, Aug. 2, 1923.

President Coolidge, now elevated from the vice-presidency, set up a new regime in the White House. He proved to be a man of strong character, who consulted those whom he trusted and then made up his own mind and stood by his decisions. Coolidge for the time being continued Harding's cabinet, but later changes were made, so that at the end of five years Secretary of the Treasury Mellon, Secretary of Commerce Hoover and Secretary of Labour James Davis were the only men left of Harding's first cabinet.

The growth in wealth and enterprise reacted upon the government where even the president's cabinet was disturbed and dismembered by a painful series of accusations and investigations. For several years the government had conserved certain oil-bearing areas of public land as a supply of oil fuel for the navy. On April 7, 1922, jurisdiction over this matter was transferred from the navy department to the interior department by an order of President Harding. Under this authority Secretary of the Interior Albert B. Fall leased to the Sinclair interest a large tract in the Teapot Dome district in Wyoming, and also leased one of the California reserves to the oil magnate, Edward L. Doheny. There was an investigation by a senate committee under the chairmanship of Sen. Thomas J. Walsh of Montana. Secretary of the Navy E. Denby resigned and was replaced by Judge Curtis D. Wilbur of California. Meanwhile Att. Gen. Harry M. Daugherty came under attack. A special committee of the senate under Sen. B. K. Wheeler of Montana unearthed questionable procedures and Daugherty refused to allow the files of his office to be examined by the senate committee. President Coolidge demanded his resignation March 28, 1924. Criminal proceedings were instituted against Fall, Doheny and Daugherty, but legal technicalities were invoked by the defense and President Coolidge took a neutral attitude in these proceedings, which he considered to be outside the scope of the executive power. Daugherty was succeeded as attorney general by Harlan F. Stone of New York; then Stone was placed on the supreme court bench and John G. Sargent of Vermont became attorney general.

In the congressional elections of 1922 the Republicans had retained small working majorities in both house and senate. There was, however, a return of earlier conditions in the appearance of a small group of independent Republicans, with Robert La Follette of Wisconsin as leader, who were able sometimes to hold the balance of power between the regular Republicans and Democrats. President Coolidge's conduct during his eight months in office seemed to justify the confidence of his party; and when the Republican convention met in Cleveland there was little opposition to his nomination. The vice-presidency offered difficulties. In the end the choice fell upon Charles G. Dawes, known through his association with the commission of 1923 which had devised a scheme for the payment of reparations by Germany. The Democratic convention, held in New York city, was the longest and fiercest in 60 years. The vote was divided between William G. McAdoo, former secretary of the treasury, and Alfred E. Smith, who had won a national reputation as governor of New York.

The convention balloted 103 times; but neither candidate could secure the necessary two-thirds. The convention finally nominated John W. Davis of West Virginia, former ambassador to Great Britain, with Charles Bryan (brother of William J. Bryan) as vice-presidential candidate. The campaign was quiet; in the election (Nov. 1924) Coolidge received 15,725,016 votes, as against 8,386,503 for Davis and 4,822,856 for La Follette, who gathered up many discontented Republicans and the considerable vote usually cast for Socialist and other minor candidates. La Follette, however, had only the 13 electoral votes of his own state as against 136 for Davis and 382 for Coolidge. It was a substantial Republican victory, accompanied by a Republican majority over-all of 59 in the house and 16 in the senate. Vice-President Dawes on taking his seat in the senate for the first time (March 4, 1925) seized the occasion to suggest that the procedure of that body needed reform; and that its first duty was to pass

an efficient rule of closure.

Finance.—Throughout both his terms of presidential service Coolidge addressed himself to a policy of economy. He stood by the budget bill which President Harding had secured from an unwilling congress and continued the appointment of Gen. Herbert M. Lord as chief budget officer. This reform meant simply that congress would not begin to act on the main appropriation bills until a budget based upon the ascertained needs of all the various departments had been drawn up, totalled and submitted by the budget officials.

In 1913 the United States had adopted an income tax, made possible by the 16th amendment to the constitution. During World War I the tax was used to transfer some of the immense war profits to the public treasury. Thenceforward the income tax was the largest factor in the national revenue and was vigorously collected from individuals and corporations. The policy of the government was to break down the high scale of war expenditure, to dispense with superfluous employees and so to come back to the public needs in time of peace. Several acts of congress, begun in 1921, reduced the rate of income tax. The result was that the amount paid in income taxes, which was $2,600,763,000 in 1919 and $3,956,936,000 in 1920, came down to $1,691,090,000 in 1923 but rose to $1,761,659,049 in 1925. By the act of Feb. 26, 1926, the rates were still further lowered but without any decrease in the total collected; and the provision in the statute of 1924, under which the amounts paid by individuals or corporations were open to the public, was repealed.

The Underwood tariff of 1913, passed by the Democrats and somewhat altered in 1916 and 1921, was repealed by a Republican majority after the inauguration of President Harding; and an emergency act was passed (May 27, 1921). Soon afterward the Republicans framed a new bill, the Fordney-McCumber tariff, signed by President Harding Sept. 21, 1922. It included a provision, never before a part of a United States statute, under which the President (informed by a tariff commission) was to have power to alter rates of duty if necessary to "equalize the differences in cost of production in the United States over similar articles produced elsewhere." The receipts from duties on imports, which were $334,000,000 in 1910 and $324,000,000 in 1920, rose to $549,000,000 in 1925. The public debt, which for many years previous to 1917 stood at about $1,000,000,000, was $26,594,268,000 after the close of World War I (Aug. 31, 1919); but on June 30, 1926, had been reduced to $19,643,183,000, partly by selling surplus war material and chiefly by payments made out of surplus.

Industry and Commerce.—However much the wealth of the nation increased, large areas of the country were far from prosperous. The rural credits banks, established under President Wilson, furnished needed capital, and the farmers from 1917 to 1919 had a guaranteed government price of $2.20 per bushel for wheat. When that protection was taken off after the war, a group of members of congress in both house and senate, commonly called the agricultural bloc, demanded special consideration for the agriculturists. Prices had tumbled and agricultural land values, inflated during the war, fell back to or below ante bellum prices. The cost of living had nearly doubled. Discontent was reflected in the large popular vote for La Follette in 1924. Various propositions were made by farmers' associations and sympathetic members of congress that the federal government permanently guarantee a price for the principal staples. The south was also affected by this movement because the inroads of the boll weevil for a time greatly reduced the output. In some degree the conditions of 1885–95 were reproduced; only it was no longer east against west so much as it was the farmers of all sections against the group of manufacturers and distributors wherever established.

In spite of federal suits and supreme court decisions substantially upholding federal control under the Sherman act, the Mann-Elkins act and other measures against combinations, consolidations of capital went on steadily. The railways, which had been sustained during World War I by the government, were returned to their owners in 1920. For several years, notwithstanding a great increase in passenger and freight rates during the war, they were unable to make a fair profit. Under the Esch-Cummins act of 1920 they were allowed to retain a profit of 5½% earnings, plus one-half of 1% to make provision for improvements chargeable to capital accounts, all excess over 6% to be evenly divided with the government. Meanwhile the administrative commissions lost prestige. The Tariff commission was disregarded. The Labor board was unable to enforce its decisions. The Interstate Commerce commission and the Federal Trade commission suffered in prestige and influence from internal strains and quarrels. The special Shipping commission, created during the war to build up a national merchant fleet, was left with a large number of vessels for which profitable business could not be found. The supreme court decisions, under which great corporations like the Standard Oil company and the American Tobacco company were regulated, left them more prosperous than ever. The hold of the great banks and the smaller banks and bankers on the finances of the country was unshaken. Deposits in national and state-chartered banking institutions in 1925 aggregated more than $40,000,000,000.

Social Questions.—During World War I the United States offered extraordinary wages in order to activate the pursuits necessary to supply the armed forces. This led to a general rise in wages of skilled workers, some increase for the unskilled and considerable increase in the earnings of domestic and agricultural workers. The labour unions made it their business to see that no systematic reduction of wages should succeed. In 1923 and again in 1925 came serious strikes of the miners' unions. The last one endured 170 days, and was settled only with great difficulty.

The most serious social question and most difficult governmental problem was national prohibition (*see* PROHIBITION). In 1918, while 30 states had laws on their statute books for the restriction of the liquor traffic, 28 states prohibited it outright. A prohibition (18th) amendment to the federal constitution was passed by the congress, was ratified by a vote of 46 state legislatures and became a part of the constitution Jan. 16, 1919. On Oct. 28, 1919, the Volstead act for enforcing the amendment was passed by congress over the veto of President Wilson. It forbade the sale or transportation of "intoxicating liquor" which was defined as any liquor which contained one-half of 1% of alcohol. To administer this act required a large force of officials distributed over the country. The amendment contained a clause under which the states were to have "concurrent jurisdiction," which appeared to mean that state laws might continue in force and be carried out by state courts. From the very beginning there was an organized system of evasion of the laws. A regular system of "bootlegging," illegal sale and transportation sprang up. It was countered by "highjackers"—that is, bandits who seized bootleggers' supplies and carried them off by force, knowing that they were not likely to be followed by officers of the law. An organized marine bootlegging trade placed a line of foreign sailing craft and steamers just outside the three-mile limit of the United States, whence they supplied the markets of the adjoining coasts.

The United States entered into treaties with Great Britain and other nations in which it was agreed that vessels carrying their flags might be captured within that distance from the United States coast which could be traversed in one hour by the vessel suspected of endeavouring to commit an offense. Within the United States large numbers of otherwise law-abiding persons bought and sold or gave away bootleg liquor, and the difficulties of executing the law were shown by the figures of national enforcement. In one fiscal year (1924–25) 20,000,000 gal. of distilled and fermented liquors were seized; 77,000 persons were arrested; 50,000 criminal cases were entered against bootleggers; 35,000 pleas of guilty were entered; and 38,000 convictions were obtained. A national law regulating the traffic in habit-forming drugs was enacted May 26, 1922.

National Defense.—The armies were returned and disbanded after World War I as quickly as possible; but a demand was made at once for some immediate acknowledgment of their services. The government had attempted to head off this movement by an elaborate system of life insurance. It also instituted a large rehabilitation system for training disabled veterans in pursuits in which they could earn their own living. The government provided

hospitals and care for sick and disabled soldiers. Provision was made for special privileges to former soldiers. On Sept. 20, 1922, a national bonus bill was defeated by President Harding's veto. On March 18, 1924, a bonus bill was passed by a large majority vote in congress; it was vetoed by President Coolidge but passed over his veto, May 17–19.

Notwithstanding the experience of the United States in 1917, when it declared a war without any mobile army, strong pressure was put on congress to reduce the regular army. By an act of Feb. 12, 1925, the force of the regular army was set at 125,000 enlisted men and 7,953 enlisted men of the Philippine scouts. Many veterans joined the American Legion, the most widely distributed society of servicemen; and that body had considerable influence in the legislation for former soldiers.

International Relations.—President Coolidge, accepting the resignation of Charles E. Hughes from the department of state, appointed as his successor (Feb. 1925) Frank B. Kellogg, previously a senator and ambassador to Great Britain. To the powerful chairmanship of the committee on foreign relations, after the death of Henry Cabot Lodge of Massachusetts, succeeded William E. Borah of Idaho (Dec. 1924). A great improvement in the conduct of foreign relations was introduced by the Rogers act, which took effect July 1, 1924, and under which the consular and diplomatic services were merged and the policy of training young men with the prospect of lifelong service was adopted.

The general policy of the United States toward other nations was much affected first of all by changes in international trade caused by the disruption of World War I; then by the refusal of the senate in 1919 to approve the Versailles treaty and further by a strong popular opposition to any formal relation with the League of Nations. A treaty with Germany (July 2, 1921) formally restored peace, provided for commerce and arranged for an adjustment of claims. Similar treaties were made shortly afterward with Austria and Hungary. The Lausanne treaty with Turkey, signed on July 24, 1923, was defeated in the senate on Jan. 18, 1927.

An important question of the early 1920s, partly social and partly international, was that of immigration, which went through a new phase because of the rush of people from other parts of the world as soon as the war was ended. Complaint was made that in the previous two decades the greater number of immigrants came from southern and eastern Europe, and were not by tradition and inheritance of the same type as most of the previous immigrants. Several changes were made in 1918 to reduce the number of "undesirables," yet the year 1920–21 brought 800,000 immigrants. By an emergency act of 1921 a quota was provided, assigning to each nation 3% of the nationals in the United States according to the census of 1910. By the act of 1924, a permanent quota system was enacted, based on 2% of the number of nationals of that country shown to be in the United States by the census of 1890. After July 1, 1927, the limit was placed at 150,000 annually.

Among the incidents of foreign relations after World War I was the recognition of various new countries created by the treaty of Versailles: Poland, Latvia, Lithuania, Estonia, Finland, Czechoslovakia, Yugoslavia, Hungary and the enlarged Rumania. In 1924 the United States received a minister from the Irish Free State. The British government consented to the appointment of a Canadian representative at Washington.

The last U.S. troops were withdrawn from Germany in 1923. Meanwhile a joint commission on German claims was far advanced in its task. A troublesome difficulty was that a treaty with Prussia, entered into in 1828 and assumed in 1871 by the German empire, entitled German citizens in case of war to nine months to dispose of their property in the United States and leave the country. Instead, all discernible property of Germans, and particularly of German corporations, was seized at the beginning of the war and placed in the hands of a custodian of enemy property. Valuable German patents were turned over, for a very small payment, to U.S. manufacturing chemists. It was not until March 10, 1928, that President Coolidge signed a bill appropriating $50,000,000 to cover the value of the property seized.

Reparations and Allied Debts.—The United States was no party to the provisions of the Versailles treaty providing for German reparations, particularly to France, and the payment of an indemnity by Germany. However, the costs of the U.S. force of occupation were to be paid by Germany. In 1921, when Germany did not pay the stipulated sums to the Allies, the French occupied the Ruhr valley. The United States suggested a commission which, headed by Charles G. Dawes, succeeded in working out a plan (1924) that was acceptable to France, Great Britain and Belgium, for a method of payment secured by a lien on German railways and factories. Financially the importance of the Dawes plan to the United States was that it cleared the way for considerable investments of private capital in German municipal and corporate securities.

A serious and difficult issue was that of the sums lent by the United States to other governments during World War I, aggregating $9,500,000,000. Without those large advances the Allies would have broken down economically before a U.S. army could have been placed in Europe. Nearly all the allied European countries shared in these advances. At the end of 1922 the total principal was about $10,000,000,000 and the accumulated interest $1,500,000,000 more. This sum was funded in United States government bonds placed at about 4% interest, mostly in U.S. hands, upon the same footing as other obligations of the government. The interest was paid by the United States treasury. In 1923 the first important adjustment of the debt was made by an agreement with England (Feb. 28, 1923). The whole amount of the principal and interest then due was funded at $4,000,000,000 to be paid in annual instalments beginning with $23,000,000 a year and increasing, until in the 62nd year the debt and accruing interest would be extinguished.

In April 1926, following an unsuccessful visit of a French debt commission to the United States in Sept. 1925, the Bérenger-Mellon settlement was finally arrived at with France.

The total amount of the French indebtedness to be refunded, after a cash payment to adjust the sum to round figures, was declared to be $4,025,000,000, and the repayment of this amount with interest was to be spread over 62 years as in the other war debt settlements. The total sum to be received by the United States under this agreement amounted to $6,847,674,104, an increase of approximately $627,000,000 over the previous French offer made by M. Caillaux in 1925.

Comparing the French settlement with those of Great Britain and Italy, the figures worked out as follows: Great Britain's debt after discounting represented slightly more than 80% of its total obligation, France's approximately 50% and that of Italy 26%. The house of representatives voted approval June 2, but ratification by the senate was deferred pending the action of the French legislature. The various agreements made to the end of April 1926 left only $295,000,000 of unfunded World War I debts to the United States, including $193,000,000 owed by Russia. In nearly all cases the period of payment was so long and the interest so low that the settlements involved payment at the value of from one-quarter to more than three-quarters of the original advances by the United States.

Latin America.—With Latin America the United States in the main enjoyed peaceful relations during this period. The long-standing question of the Isle of Pines was adjusted by a treaty (March 13, 1925), under which the title of Cuba was acknowledged. At the request of Chile and Peru, President Harding agreed in 1922 to arbitrate the dispute over the ownership of the Tacna-Arica region. After Harding's death President Coolidge took up the task and rendered his decision (March 4, 1925) to the effect that the delayed plebiscite of the inhabitants should now be taken; and General Pershing was made the head of a commission to preside over this process. Chile objected, and nothing was done.

With Mexico relations became strained by a dispute over the application of the new Mexican constitution of 1917 under which aliens were forbidden to hold lands or concessions. Mexicans claimed that this was in accord with the practice of several states in the United States. In 1925 Secretary of State Kellogg pro-

*Composition at opening of first session.

tested against the attitude of Mexico as unfriendly and declared that the government of Mexico was on trial before the world. In March 1926 a financial understanding was reached.

The League of Nations.—After the refusal of the United States to ratify the treaty of Versailles or to take part in the League of Nations, no official relations with the League were established. However, large numbers of U.S. citizens were interested in the work of the League and some of them were appointed to advisory committees in which, however, they did not represent the U.S. government. Eventually the United States consented to appoint official delegates or "observers" to the League commission on opium traffic. The United States became a party to treaties, with regard to the white-slave trade, drawn up by the League but to take effect for only such countries as might ratify them. Gradually even the warm friends of the League accepted the view that it was useless for the time being to urge participation by the United States in the League.

The World Court.—Down to 1914 the International Court of The Hague, founded in 1899 and strengthened in 1907, was functioning and rendered occasional decisions. It was, however, entirely ignored by the contending parties in the six wars that broke out from 1900 to 1914 and after World War I it remained ineffective. Elihu Root, who had a share in framing the court, came forward in 1920 as the leader of an unofficial group of experts in international affairs, to propose a new world court with wide powers and jurisdiction. An advisory committee of jurists sat at The Hague and drew up a plan for the Permanent Court of International Justice. The League of Nations accepted the project and established the court (Dec. 1920) and chose the judges (Sept. 1921). (*See* PERMANENT COURT OF INTERNATIONAL JUSTICE.) The United States had no official relation with the court; but the force of U.S. public sentiment for a world league concentrated on a proposition for qualified entrance of the United States into the World Court.

This was warmly urged by President Harding and later by Presidents Coolidge, Hoover and F. D. Roosevelt. Strong opposition was made in the United States on the plea that the court was an entering wedge to the League of Nations. The whole discussion was presently merged in consideration of proposals for the outlawry of war. (A. B. H.; E. E. R.)

FROM 1926 TO WORLD WAR II

President Coolidge and Congress.—In the mid-term congressional elections of 1926 the Democrats captured 7 of the contested seats in the senate, wiping out the Republican majority in the 69th congress, and gained 13 seats in the house, making the complexion of the 70th congress (1927–29) 237 Republicans, 195 Democrats, 3 Independents in the house, and 48 Republicans, 47 Democrats, 1 Farmer-Labourite in the senate. The election foreshadowed embarrassment for the administration. Elimination of the Republican margin in the senate made it necessary for that body to conciliate the insurgent members who had supported La Follette in 1924 and had been punished therefor by being dropped from important committee assignments in the 69th congress. The Republican progressives, like Robert La Follette (the younger), John Blaine, Lynn Frazier and Gerald P. Nye, were now restored to regular standing, and exacted from the floor leader, Charles Curtis, as the price of their support of the party the promise that "certain legislation of paramount interest to the people" (farm relief, investigation of U.S. policy in Latin America, a bill to regulate the issuance of injunctions) should be brought to a vote during the first session of the 70th congress. On these questions, as on several others of major importance, such as the details of tax reduction, the disposition of Muscle Shoals, the naval program, Mississippi flood control, the method of prohibition enforcement, President Coolidge found himself at odds with congress. He did not, however, attempt to drive congress, as Theodore Roosevelt and Wilson had done. With characteristic patience he held to his policies, vetoing 16 bills and resolutions in the first session of the 70th congress (Dec. 5, 1927–May 29, 1929), and insisting in his messages and speeches on obedience to law and on rigid economy.

National Finances.—The era of prosperity which set in at about the time of Coolidge's accession to the presidency continued unabated during his entire administration. Except in a few "spots," such as the bituminous coal and textile industries, production mounted steadily, consumption kept pace and labour was well employed and content. The national wealth, which had stood at about $7,000,000,000 in 1850, $25,000,000,000 in 1870, $65,000,000,000 in 1890 and $350,000,000,000 in 1920, was approaching the $450,000,000,000 mark by 1929. The annual income had reached $90,000,000,000 and annual savings were more than $17,000,000,000. The United States was investing about $2,000,000,000 of surplus wealth abroad and diminishing the national debt by nearly $1,000,000,000 each year. The abundant receipts of the treasury (more than half from income taxes), combined with the careful co-operation of the committees of the administrative departments under President Coolidge and Director of the Budget Herbert M. Lord, resulted in substantial surpluses at the end of every fiscal year. On Feb. 26, 1926, the president signed a bill for a tax reduction of $388,000,000.

In spite of the cut in taxes the surplus continued to mount, and on May 29, 1928, the president signed the third tax reduction bill of his administration (relieving corporations and certain industries but leaving the personal schedules unchanged), involving a cut of about $220,000,000. The refunding of the Second and Third Liberty Loans in 1928 effected a saving to the government of $75,000,000 a year in interest charges. As President Coolidge's term drew toward a close, however, the prospect for further tax reduction vanished, and there was even some apprehension that the treasury might be confronted for the first time in the administration with a deficit instead of a surplus. This was caused by certain extraordinary demands on the government, such as the appropriation of $75,000,000 for the refund of taxes illegally collected, of $50,000,000 for the settlement of claims arising out of taking over alien property during World War I, of nearly $50,000,000 for a public buildings program and of about $20,000,000 for initiating work on the vast $315,000,000 program for federal engineering work on the lower Mississippi river.

National Defense.—Since it was still the view that the geographic position of the United States brought immunity from fear of attacks by strong and hostile neighbours, the country followed the traditional policy of a small and well-equipped army supplemented by state militia. The regular army of about 132,000 men meant only 1.1 soldiers to every 1,000 of population and every $3,250,000 of national wealth. Reduction of land armaments was not a problem in which the United States was directly interested. But the government worked diligently for the reduction of naval armaments. After the failure of a proposed conference on disarmament, President Coolidge came out more positively for a "policy of adequate defense." A five-year building program had been approved by Secretary of the Navy Curtis D. Wilbur in the summer of 1926, calling for 71 new vessels (cruisers, submarines, destroyers and carriers) to cost nearly $800,000,000. Cutting this program to 15 cruisers and 1 aircraft carrier, the house, on March 17, 1928, passed a bill for the construction of the 16 vessels in three years at a cost of $274,000,000. The cruiser bill was put over to the short session of the senate, where it met sharp opposition, especially as it was pending at the same time as the ratification of the Kellogg pact for the renunciation of war as an instrument of national policy. However, the bill was passed on Feb. 5, 1929, by a vote of 68 to 12, and was signed by the president. On Feb. 28, 1929, congress agreed to a $12,370,000 addition to the naval appropriation for the new vessels, $200,000 to be available at once for starting the 1929 group of five and $200,000 to be available on July 1, 1929, for the beginning 1930 group. The progress of aviation began to play a great part in the field of national defense.

Railroads and Shipping.—During World War I the major agencies of transportation had been taken over by the government. The railroads were restored to their owners on March 1, 1920, by the Esch-Cummins Transportation act. The physical valuation of the railroads by the Interstate Commerce commission, as a basis for rate fixing, which had been authorized in 1913

and interrupted by World War I, was to serve as the basis of the "recapture" clause of the act of 1920, by which one-half of the earnings in excess of 6% should go to the government. This provision promised endless litigation. The validity of the commission's method of valuation was presented to the supreme court of the United States in the case of the St. Louis and O'Fallon railroad, called "the greatest lawsuit in history" because of the immense sums involved in the right of the government to recapture excess earnings. This railroad's earnings in excess of 6% of the commission's valuation had been ordered paid to the government. The court, with Justices Oliver W. Holmes, Louis Brandeis and Harlan Stone dissenting, rejected the commission's valuation on the ground that no weight had been given to "reproduction" cost. (49 Sup. Cl. Rep. 384.) But, since no criteria were laid down as to how much weight was to be given to this factor, the decision could not be said to be decisive.

At the close of World War I the United States Shipping board had on its hands a large number of merchant ships seized from Germany or constructed by the Emergency Fleet corporation. Many of the smaller cargo ships the board sold as junk, but it maintained the larger vessels in the passenger and freight service. In 1923 five ships of the "President" class were purchased by the Dollar line. By the Jones-White act of May 1928, congress reluctantly appropriated $250,000,000 for the maintenance of the fleet and loans for the construction of new vessels. On Jan. 16, 1929, the Shipping board received a bid from the P. W. Chapman company of New York, which was to pay $16,082,000 for the "Leviathan," the "George Washington," the "America," the "Republic," the "President Harding," the "President Roosevelt" and the five ships of the American Merchant line, and promised to build, with the aid of a government loan, two new vessels "superior in type and size to the 'Leviathan.'"

Efforts at Farm Relief.—In the midst of general prosperity the farmers complained that they were poorer. The value of their capital investment had shrunk from $79,000,000,000 to $59,000,000,000 in the five-year period 1922–27, and the return on this capital was less than 3%. While overproduction kept the prices of their products down, state and local taxes and the cost of farm implements and machinery were rising. The farmers asked the government to come to their relief (as it helped the manufacturers by the tariff, and labour by the restriction of immigration) by purchasing their surplus product of wheat, corn, cotton, hogs and tobacco and selling it abroad for what it would bring in the world market, assessing the loss and the cost of the operation on the industries benefited (the "equalization fee"). The McNary-Haugen bills embodying these demands were kept before congress during the last three years of the Coolidge administration. The first bill failed of passage in the late spring of 1926, but in Feb. 1927 a McNary-Haugen bill went through both houses. President Coolidge vetoed it because it put the government into the farming business, though he was willing to help the farmers help themselves by generous contributions to co-operative marketing projects and by aid from the department of agriculture. The veto was accompanied by an opinion from Att. Gen. John Sargent condemning certain features of the bill as unconstitutional. Nothing daunted, the advocates of farm relief came forward with a third McNary-Haugen bill, which passed congress by increased majorities in the spring of 1928, only to meet with a second veto from the president (May 23). The senate failed by the margin of 50 votes to 31 to pass the bill over the veto. On the first day of the short session of the 70th congress (Dec. 4, 1928) the fourth McNary-Haugen bill was introduced, this time without the equalization fee. No action was taken on it during the session, but President Hoover called an extra session of the 71st congress to meet on April 15, 1929, to deal with farm relief and the revision of the tariff. President Coolidge's vetoes of the farm relief bills roused opposition in the west and led to predictions that the farming sections of the country would not support an administration candidate for the presidency in the campaign of 1928. But Hoover carried every one of the agricultural states (*see* below).

Latin-American Relations.—The controversy with Mexico over her legislation to put into effect the provisions of article 27 of the constitution of 1917, regulating alien exploitation of mineral and agricultural lands, was further embittered by the appeal made to the Catholics of that country against Pres. Plutarco Calles' measures against the foreign clergy of the Roman Catholic Church in Mexico, and by the report that the Mexican bolshevists were encouraging the rebels in Nicaragua in their resistance to the U.S. marines. So serious was the situation at the beginning of 1927 that the United States senate by a unanimous vote asked President Coolidge to submit the controversy with Mexico to arbitration. The president ignored the request, but in the autumn he sent Dwight W. Morrow, of the firm of J. P. Morgan & Co., as ambassador to Mexico. Morrow's friendly and tactful diplomacy resulted in an early agreement with President Calles, and the amicable relations of the two countries were greatly strengthened when Col. Charles A. Lindbergh, after a nonstop flight from Washington, arrived at Mexico City (Dec. 14, 1927) as a U.S. "ambassador of good will."

President Coolidge, in spite of criticism in congress and in the liberal press of the country, held to his policy of maintaining about 5,000 marines in Nicaragua to quell the revolt against Adolfo Díaz and to protect U.S. lives and property. The forces of Díaz and Juan Sacasa agreed to lay down their arms when Coolidge sent Henry L. Stimson to Nicaragua with an ultimatum in April 1927, but the rebel leader Augusto Sandino continued a guerrilla warfare in which 20 U.S. marines were killed and 50 wounded. When Sandino was overcome, both parties agreed to an election, which was held under the supervision of U.S. troops (Dec. 4, 1928) and resulted in the victory of the Liberal candidate, José Moncada.

The sixth Pan-American congress was opened by President Coolidge in person, at Havana, Cuba, on Jan. 16, 1928. Charles E. Hughes headed the U.S. delegation, and steered the conference away from the embarrassing political questions raised by the United States intervention in Nicaragua. A supplementary Pan-American Conference on Arbitration and Conciliation met at Washington, D.C., on Dec. 10, 1928, which not only negotiated a score of arbitration treaties between the Latin-American nations, but was influential in keeping Bolivia and Paraguay from going to war over disputed territory.

The Briand-Kellogg Peace Pact.—On the tenth anniversary of the entrance of the United States into World War I (April 6, 1927), the French foreign minister, Aristide Briand, proposed that the United States and France should agree to a treaty renouncing war as an instrument of national policy, and agreeing to settle disputes of whatever origin or nature by pacific means. Secretary of State Kellogg replied, suggesting that the treaty be extended to other nations. On Aug. 27, 1928, the representatives of 15 nations met at Paris and signed the Briand-Kellogg pact. Secretary Kellogg represented the United States at Paris. On Jan. 15, 1929, the senate ratified the pact.

The Election of 1928.—President Coolidge having announced that he would not run for the presidency in 1928, the field was left open for Secretary of Commerce Herbert C. Hoover, who was easily nominated, receiving 837 out of the 1,084 votes cast in the first ballot, at the nominating convention at Kansas City, June 12–15, 1928. The delegates to the Democratic nominating convention at Houston, Tex., on June 26–29, cast 849¾ votes out of 1,100 for Alfred E. Smith, then serving his fourth term as governor of New York. Sen. Charles Curtis of Kansas and Sen. Joseph T. Robinson of Arkansas were named as the respective vice-presidential candidates. Each of the four nominations was made on the first ballot cast. The platform of the Republican party promised farm relief and a careful revision of the tariff, defended the Coolidge policy in Nicaragua and adopted a prohibition plank written by Senator Borah, pledging the administration to a "vigorous enforcement" of the 18th amendment. The Democratic platform contained a scathing denunciation of the "sordid corruption and unabashed rascality" of Republican rule, which had left "agriculture prostrate, industry depressed, and workmen without employment," and pledged action instead of broken promises for the relief of the farmer. Governor Smith telegraphed to Chairman Joseph Robinson of the convention endorsing the platform in general, but adding that it was his duty as the chosen

leader of the party to say that he advocated "fundamental changes in the present provisions for national prohibition." Hoover made only a few campaign speeches. Governor Smith, on the other hand, toured the country and discussed definite policies which he proposed to adopt if he were elected. On election day, Nov. 6, 1928, Hoover carried 40 of the 48 states, including four (Virginia, North Carolina, Florida and Texas) which had been Democratic since the days of reconstruction. The electoral vote was 444 for Hoover to 87 for Smith. But the popular vote of 21,391,381 to 15,016,443 indicated no such crushing defeat for the Democratic candidate. The Socialist candidate, Norman Thomas of New York, polled 267,835 votes; the Communist party candidate, William Z. Foster, 21,181; the Socialist-Labour candidate, V. L. Reynolds, 21,603; and the Prohibitionist candidate, William Varney, 20,106. Hoover's invasion of the "solid south" was attributed by the Democrats to the prejudice in that section against Governor Smith as a "wet" and a Roman Catholic, while the Republicans saw in it the swing of the south toward tariff-protected industry and the recognition of Hoover's wide experience as an executive. Soon after the election Hoover sailed from San Diego, Calif., on the battleship "Maryland," for a good-will tour to the countries of Central and South America. He visited Honduras, Nicaragua, Costa Rica, Ecuador, Peru, Chile, Argentina, Uruguay and Brazil.

Hoover retained Secretary of the Treasury Mellon and Secretary of Labour Davis of the Coolidge cabinet in office, the former remaining until Feb. 1932 when he was appointed ambassador to Great Britain, and was succeeded in the treasury department by Undersecretary Ogden L. Mills; and the latter resigning the secretaryship of labour in 1930 to run for U.S. senator from Pennsylvania, being replaced in the cabinet by William N. Doak of Virginia. The eight new appointees (none from the states of the south which Hoover had carried) were Col. H. L. Stimson, governor general of the Philippines, for secretary of state; James W. Good of Iowa, secretary of war (succeeded in December by P. J. Hurley of Oklahoma); William De Witt Mitchell of Minnesota (a conservative Democrat), attorney general; Charles Francis Adams of Massachusetts, secretary of the navy; Walter F. Brown of Ohio, postmaster general; Ray L. Wilbur of California, secretary of the interior; Arthur M. Hyde of Missouri, secretary of agriculture; and Robert P. Lamont of Illinois, secretary of commerce, succeeded in 1932 by Roy D. Chapin of Michigan.

The Agricultural Marketing Bill.—In accord with the campaign pledge President Hoover called the 71st congress (senate 55 R., 39 D., 1 F. L.; house 269 R., 165 D., 1 F. L.) in special session on April 16, to consider the problems of farm relief and the revision of the tariff. After the senate had tried in vain to insert a debenture clause into it, an agricultural marketing bill was passed by large majorities and signed by the president on June 15. The bill aimed at the encouragement of producer-owned and producer-controlled co-operative associations, which should eliminate wasteful methods of distribution and prevent the accumulation of surpluses which caused "undue and excessive fluctuations or depressions" in the prices of agricultural products. It created a federal farm board of nine members (including the secretary of agriculture), and provided a revolving fund of $500,000,000 from which loans were to be made to the farmers' co-operatives at a rate of interest not to exceed 4%. For a few months the Farm board promised to be a great success. New co-operatives were formed for the marketing of grain, fruit, cotton, vegetables and livestock, and the board approved loans to 132 co-operatives, totalling $165,000,000. But as farm prices continued to sag in the disturbed condition of world markets, it became evident that the farmers could not borrow themselves out of debt. The board then departed from its announced plan of not buying or selling farm products itself. The government entered the market and backed the grain and cotton Stabilization corporations by purchasing 330,000,000 bu. of wheat and more than 1,000,000 bales of cotton, in the endeavour to peg the prices of these commodities by holding the surpluses off the market. The endeavour failed; and at the close of 1931 the books of the board showed a loss of about 50% on the $378,000,000 advanced for the purchases. It was evident that the agricultural problem was no nearer solution in 1932 than it had been in 1922. The farmer, because of high taxes, tariff walls and world depression, could not sell his staple crops for what it cost to raise them.

The Hawley-Smoot Tariff.—A "limited revision" of the tariff had been advocated in the Republican party platform and recommended by President Hoover. But the bill passed (264 to 147) by the house on May 28, 1929, bearing the name of W. C. Hawley of Oregon, chairman of the ways and means committee, increased the duties on more than 1,000 articles, raising the average rates far above those of the Fordney-McCumber act of 1922. In the senate the insurgents (Borah, George Norris, La Follette, Brookhart, Frazier and Nye) fought against the high rates. The final vote on the bill (June 13–14, 1930) was 44 to 42 in the senate and 222 to 153 in the house. President Hoover signed the bill, justifying his action on the ground that the "flexible" provision permitting him to alter the rates within a compass of 50% on advice of the Tariff commission would enable him to remedy any injustices in the bill. The evil effects of continuing to maintain a Chinese wall around the country, when the health of world commerce depended on international co-operation, were soon evident. Before the close of 1931, about 25 foreign countries had raised their tariff walls, chiefly against U.S. goods, by way of reprisal. Debtor nations, whose only means of payment was the shipment of merchandise to the U.S., found their goods shut out by the customs barrier. In the 17 months preceding June 1930, U.S. exports had been $6,828,000,000 and U.S. imports $5,766,000,000. In the next 17 months these figures had dropped to $4,007,000,000 and $3,262,000,000 respectively—a total shrinkage of $5,326,000,000 in U.S. foreign trade. Widespread depression in Europe, revolutions in Latin America and riots and civil war in India and China were playing havoc with world trade.

The Wickersham Commission.—President Hoover was concerned with the widespread disregard for law, as evidenced by the operations of bootleggers, highjackers, kidnapers and racketeers and the failure of the courts to convict and punish criminals. The United States led the world in the sinister statistics of homicide, burglary, holdups, graft and defalcations. Gangsters armed with machine guns and provided with high-powered motorcars terrorized the cities and defied, bribed or cowed the sworn guardians of the law. The court records showed that the chances that the criminal would be convicted and brought to condign punishment were only about 3 in 100.

On May 20, 1929, President Hoover appointed a commission of 11 citizens, headed by former Att. Gen. George W. Wickersham, and including Newton D. Baker, Dean Roscoe Pound of the Harvard law school, and 3 federal judges, to investigate and report on the "dominant national problem" of the observance and enforcement of the law. After 18 months of investigation the commission submitted the first instalment of its report (Jan. 19, 1931). This report, described by one newspaper as "the most astonishing document ever submitted to our government by a responsible committee," instead of clearing up the confusion of opinion on prohibition only made it worse. Ten of the 11 members signed the body of the report, which opposed the repeal of the 18th amendment or the modification of the Volstead act; but in individual opinions appended to the report only four members favoured the continuance of the law as it stood, while five recommended modification and two absolute repeal. The commission subsequently submitted a dozen reports dealing with the causes of crime, the machinery of the courts, penal institutions, police methods, probation and parole and the deportation of aliens.

The Stock Market Crash.—Long before the Wickersham reports were submitted, public interest was absorbed in the sudden eclipse of the prosperity which had seemed to all but a few to be established on a firm and enduring basis. For the first six months of the administration the road to wealth for all seemed to stretch broad and smooth before the American people. The prices of stocks soared to fantastic heights. Billions of dollars were drawn from the banks into Wall street for brokers' loans to carry margin accounts. In the midsummer of 1929 about 300,000,000 shares of stock were being carried on margin.

In Oct. 1929 the market broke, and the wild rush to buy stocks gave way to an equally wild rush to sell. On Oct. 29 16,410,030 shares were thrown on the market for what they would bring. Prime securities tumbled like the issues of bogus gold mines. General Electric fell from 396½ on Sept. 3 to 210 on Oct. 29. American Telephone and Telegraph dropped 100 points. du-Pont fell from a summer high of 217½ to 86; United States Steel from 261½ to 166½; Delaware and Hudson from 224¾ to 141; Radio common from 505 to 26. Savings of a lifetime were wiped out. Political and financial leaders at first affected to treat the matter as a mere spasm in the market. President Hoover and Secretary Mellon made optimistic predictions that business was "fundamentally sound" and that a great revival of prosperity was "just around the corner." In Jan. 1930 the president declared that the trend of business was "upward," in March, that the crisis would be over in 60 days, in May, that we had "passed the worst" and "would rapidly recover." Secretary Mellon saw "nothing in the present situation that warrants pessimism." But as the months passed it became evident that the nation was entering a period of severe depression. Foreign trade fell sharply, factories were closed, the number of unemployed grew alarmingly, mortgages were foreclosed, banks failed, dividends were passed, the prices of wheat, cotton, copper, oil and other commodities kept on sinking, the federal surpluses were turned into deficits and the buying power of the nation was paralyzed.

Efforts for Relief.—In Oct. 1930 President Hoover appointed a cabinet committee to formulate measures for the relief of unemployment. In December he laid before congress a vast program for road construction, public buildings, flood control and airways development, and signed 22 bills appropriating more than $300,000,000 for loans by the Federal Farm board, for emergency construction and for drought relief. In Oct. 1931 he got the bankers to form a $500,000,000 pool to help rescue the weaker banks from failure, and on Jan. 22, 1932, he signed the bill creating a $2,000,000,000 Reconstruction Finance corporation, empowered to make loans to banks, insurance companies, agricultural associations, railroads and other industries. The management of the board was vested in seven directors under the chairmanship of Charles G. Dawes, who had just resigned the post of ambassador at London. Democrats and Republicans joined in passing the bill.

The Plight of the Treasury.—It would have been comparatively easy for the treasury to provide the relief clamoured for if it had continued to enjoy the abundant revenues and the surpluses of the Coolidge administration. But the depression which had stopped the wheels of industry had also dried up the sources of revenue. Federal taxes from all sources were supplying only 50% of the expenses of the government at the beginning of 1932. Appropriations for national defense, the veterans' service and interest on the public debt absorbed every dollar of the national income. The treasury deficit, which stood at $900,000,000 at the close of the fiscal year 1931, threatened to exceed $2,000,000,000 before June 30, 1932. Yet the demands on the treasury increased. In Feb. 1931 both houses of congress had overridden by huge majorities (328 to 79 and 76 to 17) President Hoover's veto of a bonus bill, extending cash loans to the war veterans up to 50% of the face value of their adjusted certificates, at an estimated cost of $1,000,000,000. Agitation was immediately started for the full cash payment of the certificates, amounting to another $2,000,000,000, although the American Legion in its convention at Detroit in Sept. 1931 disapproved this "raid on the treasury" by a vote of 507 to 902. The treasury was still further crippled by the loss of about $238,000,000 which should normally have been collected from the debtor nations in Europe, when President Hoover, in order to save Germany from imminent financial collapse, proposed a year's moratorium on all intergovernmental debts (June 20, 1931), both principal and interest.

Efforts to Balance the Budget.—The midterm elections, coming in the midst of the depression, naturally turned against the administration. The 72nd congress, which met on Dec. 7, 1931, saw the Democrats in control of the house (220 to 214) while the senate was almost equally balanced (48 R., 47 D.). However, a dozen senators from the agricultural states of the west who bore the Republican label could be counted on to join the Democrats in opposition to any administration policies that smacked of favours to the "special interests." Considering the distress under which the country was labouring, congress declared it would "postpone politics," much as it had done in the emergency of World War I, and Speaker John Nance Garner of the house rallied the Democrats to support the president's recommendations for the enlargement of the credit facilities of the banks (the Glass-Steagall act) and the creation of the $2,000,000,000 Reconstruction Finance corporation (Jan. 22, 1932). The leaders of both parties agreed that the budget must be balanced; but when it came to framing the necessary tax bill harmony ceased. Everybody knew that taxes must be increased if the deficit was to be wiped out, but nobody wanted them to be increased at his own expense. The advocates of "soaking the rich" demanded high taxes on incomes, inheritances and stock transfers. Those who favoured spreading the burden over the consumers supported the sales tax recommended by the ways and means committee of the house. The bill which was passed by the house (April 1, 1932) and (after some inconsequential changes by the senate) signed by the president on June 6, was declared by Secretary of the Treasury Ogden Mills to be "inadequate" to check the growing deficit. About $1,118,000,000 was expected from its provisions, which raised the normal income tax to 8% on sums above $4,000, with supertaxes rising to 55% on incomes in excess of $1,000,000. Taxes were also levied on bank checks, telephone, telegraph and radio messages, and the sales of various luxury articles such as automobiles, radios and phonographs. But congress resisted the president's efforts to cut down government expenses. In the first four months of the new fiscal year (July–Oct., 1932) the treasury deficit mounted by almost $700,000,000.

Gestures Toward International Co-operation.—President Hoover was sincerely desirous of redeeming his inaugural pledge to co-operate with Europe in efforts for recovery from the political, financial and industrial chaos which World War I had produced throughout the whole world. In 1929 an international committee of which Owen D. Young was chairman revised the Dawes plan (*see* REPARATIONS) of dealing with the reparations payments demanded from Germany. The Young plan, besides revising the amounts of the payments, tried to take the whole matter out of the realm of politics and national revenge and make it a scientific procedure of international finance, controlled by and operating through a bank of international settlements established at Basle, Switz. In October of the same year, the British prime minister, J. Ramsay MacDonald, visited the United States and held informal conversations with Secretary of State Stimson and President Hoover. The outcome was an invitation to the five naval powers of the Washington conference of 1921–22 to meet at London in Jan. 1930 for the purpose of controlling competition in those types of war vessels (cruisers, submarines, destroyers) which had not been included in the Washington agreement. The London conference lasted from Jan. 21 to April 22, 1930. France and Italy withdrew from the conference when they thought that their "security" in the Mediterranean was threatened; but the United States, England and Japan signed the London treaty, which extended the ban on battleship construction until 1936, fixed ratios for the building of auxiliary craft and established a definite naval "parity" between the United States and Great Britain. The treaty was disappointing to the advocates of naval limitation, however, because it permitted the nations to build up to a certain limit rather than scaling down naval construction and, by the "escalator clause," allowed them to increase the ratios if their security seemed to be threatened by other nations (France and Italy). Though Europe's armies were of less concern to the United States than the navies, the United States sent a full delegation to the Limitation of Armaments conference at Geneva on Feb. 2, 1932—and accomplished nothing.

The League of Nations and the World Court.—While not departing from the official position of nonmembership in the League, the United States gave some endorsement to Hoover's pledge in his acceptance speech of Aug. 11, 1928, that the country would be "glad to co-operate with the League in its en-

deavours to further scientific, economic and social welfare and to secure the limitation of armaments." By the autumn of 1931 the government had signed more than a dozen international agreements made under the League's auspices. In October of that year Prentiss B. Gilbert, U.S. consul general at Geneva, sat at the table of the League council when it discussed the Japanese aggression in Manchuria, and a U.S. general (Frank R. McCoy) served on the Lytton commission appointed by the League to visit Manchuria and report on the situation. The deadlock over the adherence to the World Court continued during the Hoover administration. The venerable Elihu Root (who had helped frame the original statute of the court) went to Geneva late in 1928 and secured the assent of the statesmen there to the "Root Formula," which so guarded U.S. interests in the matter of advisory opinions that Secretary of State Stimson instructed our acting minister at Geneva to sign the protocol of adherence (Dec. 9, 1929). Just a year later President Hoover presented the protocol to the senate for ratification. Senator Borah and the other determined opponents of the court in the committee on foreign relations prevented the protocol from being reported out to the senate until May 1932. By that time the presidential campaign was beginning to absorb the attention of the country, and there was little probability that the senate would take any action on the protocol until the election was over. Then the emergency measures of the New Deal under Pres. Franklin D. Roosevelt so absorbed congress and the public that action on the World Court was not taken until Jan. 29, 1935. On that date 52 senators voted in favour of joining the court and 36 against—thus failing by seven votes to register the two-thirds necessary for ratification.

Campaign of 1932.—The Republican national convention met at Chicago on June 14, 1932, and renominated Hoover and Curtis on the first ballot. The platform stood pat on the merits of the Hoover administration, warned against the danger to business interests and national finances if the Democrats should come into power, and rejected a plan for a repeal of the prohibition amendment. The Democrats met on June 27, in the same building that the Republicans had vacated a few days before. Though the primaries had given Gov. Franklin D. Roosevelt of New York a substantial majority of the delegates, he was still far short of the two-thirds (770) necessary for nomination. An anti-Roosevelt group headed by Alfred E. Smith, John J. Raskob and Jouett Shouse developed considerable strength in New England and New York. Nine candidates were put in nomination, including, besides Roosevelt and Smith, four state governors and the speaker of the house, John N. Garner of Texas. Roosevelt had 666¼ votes on the first ballot, to 201¾ for Smith, 90¼ for Garner and 195¾ divided among the other candidates. On the fourth ballot Garner released his delegates to Roosevelt and William G. McAdoo, who had been supporting Garner, threw the entire California delegation to the New York governor, who was nominated with 945 of the 1,154 votes. Roosevelt immediately flew from Albany to Chicago to deliver his acceptance speech to the assembled delegates. Garner was named for vice-president. In the campaign which followed, Roosevelt had little difficulty in persuading the people that a change of administration, a "New Deal," was the only hope of recovery from the depression. Banks were failing by the hundreds. Mills and factories were shut down. The unemployed numbered more than 10,000,000. Mortgages on farms and homes were being foreclosed. National, state and local taxes were taking one dollar out of every three of the national income, and the public debt was increasing at the rate of $2,000,000,000 a year. A "bonus army" of 10,000 to 20,000 men marched on Washington in the midsummer, determined to remain until congress voted them full cash payment of their adjusted certificates. A thousand farmers in Iowa picketed the roads to prevent the delivery of their grain, milk and livestock at prices which did not pay them for production. Roosevelt toured the country attacking the Republican administration and promising economy, a balanced budget, relief for the farmers and rehabilitation of business. Prominent Republicans, including Senators Johnson and Norris, supported him openly. Toward the end of the campaign President Hoover attempted to stem the tide that was running more strongly against him every week. But it was of little avail. The verdict at the polls on Nov. 8 was a Democratic landslide. Roosevelt carried every state in the union except six (Maine, New Hampshire, Vermont, Connecticut, Delaware and Pennsylvania) with 472 electoral votes to 59 for Hoover, and a popular majority of approximately 7,000,000. The Democrats secured a majority of 191 in the house and 22 in the senate.

Two New Amendments.—The final short session of congress, which met in Dec. 1932, was the last of the "lame duck" sessions. For in Jan. 1933 the 20th amendment to the constitution was ratified, which provided that thereafter the congress elected in November should begin its session on the third day of the following January, and that the president should be inaugurated on Jan. 20. The last "lame duck" congress also passed a 21st amendment in Feb. 1933 (ratified in December) repealing the 18th (prohibition) amendment.

The New Administration.—The cabinet, announced on the eve of the inauguration, consisted of Cordell Hull of Tennessee (state); William B. Woodin of New York, who resigned in December and was succeeded by Henry Morgenthau, Jr. (treasury); Homer S. Cummings of Connecticut (attorney general); Gov. George H. Dern of Utah (war); Sen. Claude A. Swanson of Virginia (navy); James A. Farley of New York, chairman of the Democratic state and national committees (postmaster general); Harold L. Ickes of Illinois (interior); Henry A. Wallace of Iowa (agriculture); Frances Perkins of New York, the first woman to have a cabinet seat (labour); and Daniel C. Roper of Washington, D.C. (commerce). Besides these official heads of departments, President Roosevelt took intimate counsel from a number of advisers who were called the "brains trust" because many of them were college professors. Notable among them were Raymond Moley (for a time assistant secretary of state), Rexford G. Tugwell (later undersecretary of agriculture) and A. A. Berle of Columbia university, Felix Frankfurter (later supreme court justice) and O. M. W. Sprague of Harvard; and George F. Warren of Cornell. In his brief inaugural address the president scored the prevailing practices in industry and finance which he said had brought the country to distress in the midst of plenty, promised to drive the "money-changers" out of the temple, declared that the only thing the country had to fear was fear itself, and in words recalling Woodrow Wilson's inaugural of 20 years before asked the people to join him in a "national consecration" to the work of restoring prosperity through united effort.

Meeting the Crisis.—Shortly after the election President Hoover had invited President-elect Roosevelt to Washington to confer with him on measures that might ease the situation during the four months "interregnum" before the latter's inauguration. But Governor Roosevelt was not willing to commit himself to policies before the power and responsibility were actually in his own hands. The winter of distress wore on, and when inauguration day arrived the country was confronted with a crisis of the first magnitude. Beginning with Michigan in mid-February, state after state had closed its banks to prevent runs by panic-stricken hoarders. In the eight days preceding March 4, more than $1,500,000,000 had been drawn from the banks which were still open. The New York banks closed that morning by order of Gov. Herbert Lehman, and by noon every bank in the country had shut its doors. After a White House conference lasting well into the night of Sunday, March 5, President Roosevelt issued a proclamation closing all the banks for four days; and at the same time summoned congress to meet in extra session on March 9. On that day the house, without the formality of a roll call, and the senate, with only seven dissenting votes, passed the administration's Emergency Banking bill, giving the secretary of the treasury power to appoint "conservators" (quasi-receivers) for all the national banks in the country and to reopen them according to his discretion. Confidence was restored and deposits began to flow into the banks again. But, unfortunately, too many of the weaker banks were reopened. The president's Economy bill, designed to save $500,000,000 by reducing federal salaries and veterans' pensions (signed March 20), was hailed with enthusiasm by the

country; but its effect was neutralized a year later (March 28, 1934) when congress passed over the presidential veto the Independent Offices bill, restoring most of the cuts. On March 22, 1933, a bill was signed legalizing the sale of 3.2% beer, from which a revenue of from $100,000,000 to $150,000,000 was expected for the treasury.

The AAA.—The extra session sat from March 9 to June 16, 1933. In those 99 days an amazing amount of legislation was adopted. The Agricultural Adjustment act of May 12 was designed to raise the prices of farm products and relieve the farmers, who were burdened by a mortgage indebtedness of $8,500,000,000. The plan was to take about 40,000,000 ac. out of cultivation, and to reimburse the farmers for the value of the crops and the hogs they would lose by a processing tax levied on flour millers, meat packers, etc. Of course this would raise the price of bread, bacon and clothing, because the processor would pass along the tax to the consumer. Since there was a large group in congress who favoured inflation of the currency as the means of raising prices, it was necessary, in order to get the bill through, to adopt an amendment of Sen. Elbert Thomas of Colorado, empowering the government to issue $3,000,000,000 of paper money and to reduce the gold content of the dollar by not more than 50%. No greenbacks were issued, but on April 19 the government abandoned the gold standard by forbidding the export of gold, and the next January the president by proclamation reduced the gold content of the dollar to 59.06 cents. This action, which made public and private bonds payable at 60 cents on the dollar, was subject to violent attack, but the supreme court, in Feb. 1935, upheld the devaluation by a vote of five to four. The processing tax of the AAA brought in more than enough to pay the benefits to the farmers in the first year of its operation; but in 1935 was falling far behind, as cases involving its constitutionality came before the courts. In Jan. 1936 the supreme court, by a vote of six to three (Stone, Brandeis, Benjamin Cardozo) declared the AAA unconstitutional.

The NRA.—Perhaps the most startling measure of the New Deal was the National Industrial Recovery act of June 16, 1933, by which the government assumed control over the major industries of the country Representatives of the industries were invited to come to Washington to work out with the NRA administrator, Gen. Hugh S Johnson, codes of fair dealing to be followed. These codes fixed maximum hours and minimum wages, abolished sweatshop and child labour in many industries, gave labour the right to bargain with employers through representatives of their own choosing (as against the open shop or the company unions), and required businessmen to open their books to government inspectors. Violators of the codes would have the Blue Eagle (the symbol of co-operation) taken away from them, and industries refusing to formulate a code were brought under a blanket code imposed by the president. More than 700 codes were drawn up by representatives of business. From the first the NRA met violent opposition on both constitutional and economic grounds. The act was to expire in June 1935, and the administration was bent on asking for its extension when the supreme court, in the Schechter Poultry Corporation case, on May 27, handed down a unanimous decision that the codes by their wages and hours provisions exceeded the powers of congress under the interstate commerce clause, and that hence the NRA was unconstitutional. At the same time the Frazier-Lemke Mortgage Relief act was unanimously declared unconstitutional.

Emergency Relief.—Two objects, not always easily separable, were envisaged in the program of the New Deal: immediate (emergency) relief for the millions of unemployed who could no longer be taken care of by private charity or state and local funds; and long-time plans for the recovery of business and agriculture. On May 12, 1933, a Federal Emergency Relief act appropriated $500,000,000 for direct aid, one-half the sum going as a gift to supplement the amounts raised by the states and the other half to match state appropriations in the ratio of one to three. This was followed by various acts to create jobs for the unemployed at federal expense, such as the Civilian Conservation corps and the Civil Works administration. By June 1934, the total "emergency" expenditures of the government under such public works schemes, the RFC and the AAA amounted to more than $5,000,000,000. Dismayed at the burden of public debt being piled up for a future generation to pay in taxation, critics of the New Deal called for an end to extravagant spending, tinkering with the dollar, price and wage fixing and, in the words of the Republican *New York Herald Tribune*, "the whole succession of unrelated and hastily devised remedies . . . that had produced an economic chaos with no end in sight." President Roosevelt still had the confidence of the people, however. In the mid-term elections of 1934 the administration won a complete victory. The Democrats secured 322 of the 435 seats in the house and 69 of the 96 senators for the 74th congress.

President Roosevelt asked and obtained from the new congress in Jan. 1935 the sum of $4,880,000,000, to be spent virtually at his own discretion. Scores of alphabetical agencies were at work dispensing huge sums for relief and for constructive work. The projects of the Tennessee Valley authority and the Grand Coulee and Bonneville irrigation plants were being pushed. The public debt in the autumn of 1935 passed the $30,000,000,000 mark—exceeding by nearly $4,000,000,000 the World War I debt at its peak. With the adjournment of congress in Aug. 1935, after the passage of the National Security act providing for old-age and unemployment pensions, the attention of the country turned to the approaching presidential race.

The Recovery of Business.—Shortly after the adjournment of congress President Roosevelt wrote (Sept. 6, 1935) to Roy Howard, in reply to a letter asking for "the grant of a breathing spell to business and a recess from further experimentation," that the basic program of the administration "has now reached substantial completion and the breathing spell of which you speak is here—very decidedly so." Since the autumn of 1934 the upturn in business had been steady, if not rapid. Railroads, banks and insurance companies were paying back their loans from the RFC. Firms which had been deep in the red were cutting their deficits and going on to make profits. Dividends were resumed. Wages and salaries were stepped up. The farm income rose from $5,300,000,000 in 1932 to $8,000,000,000 in 1935. Foreign trade, which had reached its nadir of $2,933,000,000 in 1932, increased to $4,329,000,000 in 1935. Opponents of the New Deal insisted that the tide of prosperity would be rising far more rapidly were it not for the uncertainty in business circles as to what further measures of government interference the president might recommend. Nevertheless the indisputable fact of business improvement, a fact which the president emphasized more and more strongly in his speeches and press conferences, was a powerful factor in holding for him the continued confidence of the nation.

The Growing National Debt.—In spite of the fact that business was improving, the treasury was showing staggering deficits from year to year. The numbers of the unemployed still remained, after three years of enormous expenditures for relief, somewhere between 10,000,000 and 12,000,000. In his budget message of Jan. 1936 the president asked congress for $1,425,000,000 for relief work, in addition to the $4,880,000,000 which he had obtained the previous year. By June 1936 it was estimated that close to $9,000,000,000 had been appropriated for relief, direct and indirect, and two further features added to the immense burden of debt which the relief work was imposing upon the government. First, the disallowance of the AAA by the supreme court on Jan. 6, 1936, cut off the revenue of nearly $1,000,000,000 accruing from the processing tax, which was relied on to compensate the farmers for curtailing their production of wheat, cotton, tobacco and hogs. Then, three days later, congress, by an overwhelming vote, passed over the president's veto the bonus bill, which provided for the immediate payment to World War I veterans of their adjusted compensation certificates, due in 1945. Eight months earlier (May 22, 1935) the president had appeared before congress to read in person his veto of a similar bill, and had been able to prevent the senate (by a vote of 54 to 40) from overriding his veto. But this time both houses repassed the bill immediately, and the treasury found itself obligated to the payment of more than $2,000,000,000. The veterans were paid on June 15, 1936, in

Summary of Presidential Elections in the United States, 1860–1956

(Successful candidate in boldfaced type; unsuccessful, in lightface type. Candidates receiving no electoral vote are not mentioned)

Year	Candidate	Party	Popular Vote	Electoral Vote
1860	**Lincoln**	Republican	1,866,452	180

*Greeley died before electoral vote was cast. †One electoral vote was cast for a noncandidate.

ten-year 3% bonds of $50 each which they might turn into cash at will at any one of the 300 main post offices of the country.

The result of these outlays, both anticipated and unforeseen, was to raise the national debt at the end of the fiscal year 1935–36 to more than $34,500,000,000, or double the amount of the debt at the beginning of the Hoover administration. Republicans asserted that such pyramiding of the debt would endanger the credit of the government, and deplored the burden of taxation that its servicing would entail upon future generations. But administration leaders replied that the government was able to borrow all the money that it needed at the lowest interest rates in U.S. history.

The National Conventions of 1936.—On June 9, 1936, the Republicans met at Cleveland, O., to write their platform and select their candidates for the presidential campaign. The platform condemned the Roosevelt administration for its regimentation of business, its contempt for the constitution, its waste of the taxpayers' money, its flouting of the civil service regulations, its encouragement of class hatred and its march toward a dictatorship in concentrating unprecedented power in the hands of the executive. It recommended turning the administration of relief over to the states, with subsidies from the national government, pledged efficient aid to the farmer and the labourer, advocated the restoration of a stable currency and promised to balance the national budget without either neglecting the worthy poor or increasing taxes. For several weeks the tide of popular favour had been setting strongly toward Gov. Alfred M. Landon of Kansas as the Republican nominee. On the first ballot he received all the votes of the convention except those of 18 delegates from Wisconsin and 1 from West Virginia who voted for Sen. William Edgar Borah of Idaho. Col. Frank Knox, owner of the *Chicago Daily News* and, like Landon, a follower of Theodore Roosevelt in 1912, was unanimously named for the vice-presidency. On June 23 (two days after the end of the 74th congress) the Democrats held their convention at Philadelphia, Pa., and renominated Roosevelt and Garner by acclamation. The president, in his acceptance speech, stood pat on his program of relief, recovery and reform, scored the "economic royalists," and pledged himself to the necessary readaptation of social and economic life within the bounds of the constitution. The Socialists nominated Norman Thomas again; the Communists put up Earl Browder; and a new party appeared under the title of the Union for Social Justice, sponsored by Father Charles E. Coughlin of Detroit, F. E. Townsend, and the political heirs of Sen. Huey P. Long, nominating as its candidate Rep. William Lemke of North Dakota.

The Campaign of 1936.—The main issue, of course, was the approval or disapproval of the New Deal. The Republicans were hampered by the fact that their representatives and senators in congress had voted for many of the administration measures and by the anomalous position of Governor Landon, who condemned the New Deal and at the same time promised to continue the program of relief and recovery. A split in the Democratic ranks had been threatened when prominent members of the party, calling themselves "Jeffersonian Democrats," led the formation of the Liberty league. Alfred E. Smith and former Secretary of State Bainbridge Colby accused President Roosevelt of having repudiated the party platform of 1932. It was believed that the opposition of these dissidents, added to that of the Coughlin-Lemke party, the long existing campaign of the utility companies against the TVA and the hostility of conservatives to deficit financing and to extensive control of business would so far reduce President Roosevelt's strength as to make his victory in any case a narrow one. Indeed a *Literary Digest* poll gave Landon a popular lead of 1,293,669 to 972,897 and predicted a Landon victory of 370 to 161 in the electoral college. But the vote on Nov. 3 registered an overwhelming victory for Roosevelt. He carried 46 of the 48 states (all except Maine and Vermont), with 523 electoral votes to 8 for Landon. His popular plurality over the Republicans in a vote of 45,647,117 exceeded 11,000,000. The various minor parties polled 1,490,861 votes combined, of which Lemke (Union party) had 882,479. The Republicans elected governors in only three states (Vermont, New Hampshire and South Dakota) in which gubernatorial contests were held. The Democrats gained a dozen seats in the house and five in the senate.

Foreign Affairs.—Absorbed in his program of relief and recovery at home, President Roosevelt had paid comparatively little attention to foreign matters. The questions of the Allies' debt to the United States and of limitation of armament were not pushed. The tariff and international trade got little attention. In Nov. 1933, the government recognized the U.S.S.R., sending William C. Bullitt as the first ambassador to that country since the overthrow of the tsar's regime. The government participated in the seventh Pan-American congress at Montevideo, Urug., in the same autumn, with Sec. Cordell Hull again leading the delegation. By the McDuffie-Tydings act of 1934 the United States gave independence (to be final in ten years) to the Philippine Islands and in 1935 Manuel Quezon was elected first president of the

Commonwealth of the Philippines; and the United States at last freed Cuba from what the islanders considered an embarrassing dependence, by abrogation of the Platt amendment (May 1934). On June 12, 1934, the president signed a Reciprocal Tariff act, under which Secretary of State Hull negotiated 24 reciprocity agreements with foreign nations, which at once resulted in an increase in U.S. foreign trade. What was thought to be a guarantee of the preservation of U.S. neutrality in the event of another European war was provided by the Neutrality act of April 1935, forbidding Americans to furnish munitions or money to foreign belligerents and refusing protection to Americans sailing on belligerent ships.

But the launching of an attack on Ethiopia by Italy in the autumn of 1935, the steady encroachment of Japan on the territorial integrity of China and the outbreak, in July 1936 of civil war in Spain brought the problem of U.S. neutrality into sharp relief. While temporary neutrality legislation was passed in 1935 and 1936, the arguments continued in congress and the country between the advocates of a mandatory law, leaving no discretion to the president in case of the outbreak of war, and a flexible law, permitting the president to handle each case as it should arise.

The outcome was the War Policy act of May 1, 1937, which embodied a compromise. The mandatory provisions of an embargo on arms and ammunition, the prohibition of loans to belligerents and the refusal to allow Americans to travel on ships of the belligerents were retained; but the president was granted the all-important power of determining whether the law was to be put into effect by proclamation that a war actually existed, and was allowed wide discretion in other respects.

The President and Congress.—President Roosevelt was inaugurated for his second term on Jan. 20, 1937, in accordance with the 20th amendment to the constitution. The first session of the 75th congress, which assembled on Jan. 3, contained enormous Democratic majorities (334 to 105 in the house and 76 to 20 in the senate) which had been returned in the party's victory in the election of 1936. Interpreting the victory as an endorsement of the New Deal, the president announced in his inaugural address that he had "just begun to fight" for his program, and in his message to congress he asked that "action now" be taken on proposed measures for the regulation of hours and wages, the relief of farm tenants, the extension of social security, the control of speculation, federal health insurance and a housing program for the elimination of slums. The president also wanted legislation for a more effective crop control, for the creation of six great regional projects like the TVA and for authorization to reorganize the agencies of public works, relief and loans according to his discretion. But the congress proved to be unwieldy and unmanageable. Factions developed, and adjournment came on Aug. 21, 1937, without the enactment of any of the major measures.

The "Recession" of 1937.—A sharp decline in prosperity set in during the latter half of the year. In midsummer the production index stood higher than it had in a decade. The first quarter's output of steel had exceeded by 600,000 tons the previous high record of 1929. The national income had risen from less than $40,000,000,000 in 1932 to nearly $70,000,000,000. Then there began a decline which sent the business index down from 111.2 in August to 88.9 in November. Steel production fell from 80% to 31% of capacity. The average price of 50 stocks fell from 135.5 to 82; relief rolls swelled and the number of unemployed rose to about 10,000,000. The president called an extra session of congress on Nov. 15 to try again to get through some of the measures which he had proposed at the beginning of the year. But the session adjourned six weeks later without accomplishing any more than its predecessor had done.

The Supreme Court Issue.—Still further friction between the president and congress developed when Roosevelt proposed the addition of six new justices to the supreme court (with the purpose of inducing the six actual members more than 70 years of age to resign), and advocated a similar "infusion of new blood" into the lower federal courts. The latter proposition did not arouse much interest, but the so-called attempt to "pack" the supreme court with men who would uphold the legislation of the New Deal met with immediate opposition. The court had nullified nine of the measures of the New Deal, including such important ones as the NRA and the AAA; and on the occasion of the NRA unanimous decision in May 1935 the president had commented impatiently on the judges who were still living in the "horse and buggy days." During the entire four years of his first term President Roosevelt had had no opportunity to make an appointment to the supreme court, whereas, President Taft, for example, had six vacancies to fill in his single term. The controversy over the court reform occupied much of the attention of congress during the spring and early summer, until the president gave up the struggle when the senate, by a vote of 70 to 22, defeated the reorganization plan on July 22. Meanwhile the court had receded somewhat from its hostility to "progressive" measures. On March 29 it upheld the Washington Minimum Wage law for women. On April 12 it sanctioned the Wagner Labor Relations act. On May 27 it held the Social Security act of 1935 constitutional. The decision in practically all these cases was by a five to four vote. Justices James McReynolds, George Sutherland, Pierce Butler and Willis Van Devanter taking the negative and Chief Justice Hughes and Stone, Brandeis, Owen J. Roberts and Cardozo the affirmative.

Rapid changes in the personnel of the court from the summer of 1937 on gave the president the opportunity to create a "liberal" tribunal without resorting to innovating proposals. On June 2 Justice Van Devanter, taking advantage of the law permitting retirement at the age of 70, left the court, and was replaced by Sen. Hugo Black of Alabama, a staunch advocate of the New Deal. In 1938 Justice Sutherland of Utah, another conservative, resigned, to be succeeded by Roosevelt's solicitor general, Stanley Reed of Kentucky. Justice Cardozo died the same year, and Felix Frankfurter of the Harvard law school was appointed in his stead. In 1939 the aged Justice Brandeis, an appointee of Woodrow Wilson in 1916, left the bench and the president appointed William O. Douglas of Connecticut to succeed him. Justice Butler of Minnesota, a consistent conservative, died in 1939, and was replaced by the former governor of Michigan and of the Philippines, Atty. Gen. Frank Murphy. In 1941 Justice McReynolds, the most conservative member of the court, resigned, to give place to Sen. James F. Byrnes of South Carolina. Finally, in 1941 Chief Justice Hughes resigned after 11 years of service. The president promoted the Coolidge appointee Harlan F. Stone to the chief justiceship, and named Robert H. Jackson of New York (who had taken Murphy's place as attorney general) to fill the vacancy. So by 1942 every member of the court except Chief Justice Stone and Justice Roberts was an appointee of President Roosevelt.

The Labour Struggle.—The year 1937 saw the fiercest conflict in the field of labour since the demoralizing period immediately following World War I. The battle started late in 1935 with the formation, by John L. Lewis, president of the United Mine Workers of America, of the Committee for Industrial Organization (later changed to the Congress of Industrial Organizations) to supplant the craft unions of the A.F. of L. by industrial or "vertical" unions comprising all the workers in a given industry, something on the pattern of the "one big union" advocated by the Industrial Workers of the World (I.W.W.) a generation earlier. The new weapon used by the C.I.O. in its bitter fights with automobile and steel industries was the "sit-down strike" in which the strikers intrenched themselves in the factories and refused to work or to let others in to work. Although this trespassing was an infringement on property rights, Gov. Frank Murphy of Michigan refused to evict the strikers by force, lest bloodshed should ensue. President Roosevelt declined to take part in the struggle, crying "a plague on both your houses." Secretary of Labor Perkins at first took a complacent view of the matter, saying that the legality of the sit-down strike had not been determined; but later she condemned the movement. It petered out after a few months, but the C.I.O. grew rapidly, until by midsummer of 1937 it claimed to have drawn away more than half the members of the older organization. General Motors came to terms with the C.I.O. in March, and the major steel companies

followed suit. Fully aware that the split in the ranks of labour was hurting the cause, the two presidents of the rival organizations tried in a series of conferences to come to some agreement. But neither William Green of the A.F. of L. nor John L. Lewis of the C.I.O. would yield a point, in spite of the pleas of some of their important lieutenants for harmony. It was hoped that the National Labor Relations board (NLRB), set up under the Wagner-Connery act of July 1935, would serve to iron out disputes in the industrial field, as the Railway Labor board in 1926 had averted serious strikes on the railroads, and, indeed, up to the close of the year 1938, the NLRB did handle more than 10,000 cases involving approximately 2,000,000 workers with fair success. It provided protection to workers in interstate commerce industries, in the formation of associations to elect their own representatives to conduct collective bargaining with the employers, and forbade the latter to interfere with labour organizations or to refuse to bargain collectively. The board might issue "cease and desist" orders, subject to judicial review, to prevent employers from violating the act. However, the board encountered opposition from the beginning. The A.F. of L. complained that it constantly favoured the C.I.O. in its rulings and demanded its revision. The employers protested against its unfairness in allowing appeals from the workers only. Although the NLRA was declared constitutional by the supreme court in April 1937, the effort to have it amended or repealed was continuous. Between Jan. and Aug. 1937 more than 3,200 strikes affecting 1,470,000 workers were reported by the bureau of labour statistics. To be sure, the number of strikes decreased in the next two years, averaging 231 a month in 1938 and 192 a month in the first seven months of 1939, as against 395 a month in the year 1937. But still the hostility of the two great labour organizations to each other and of both to the NLRB continued, in spite of the president's sporadic efforts to bring peace in the labour ranks. A concession was made to industry in July 1939, when employers were given the right to call for an election to determine the proper body for collective bargaining. Also the supreme court by a six to two decision reversed a decision of the board which had ordered the Fansteel Metallurgical company to rehire the men discharged in the sit-down strike of 1937.

The outbreak of World War II in Sept. 1939 invested the labour controversy in the United States with more than a domestic significance. Following labour-management conferences, a new policy was adopted early in 1942, proscribing strikes and lockouts for the duration of the war, and in place of the NDMB the president appointed a War Labor board of 12 men (4 labour leaders, 4 industrialists and 4 members of the public) with William H. Davis as chairman. Lewis (who had resigned the presidency of the C.I.O. after turning against Roosevelt and threatening to resign if the latter were re-elected) then proposed a united front in labour: both President Green of the A.F. of L. and Pres. Philip Murray of the C.I.O. should resign, and George Meany should become president of the merged organization, with Lewis as vice-president. But neither Green nor Murray (who was not consulted) favoured the suggestion; nor did President Roosevelt.

Political Rivalry.—When the president met the final session of the 75th congress on Jan. 3, 1938, he asked for legislation on farm relief and on wages and hours in industry. He disclaimed any hostility to business in general, but accused a minority of big businessmen of antisocial practices in tax evasion, unfair competition and the maintenance of high prices. As contrasted with the "do nothing" sessions of 1937, congress passed two acts of major importance. On Feb. 14 came the elaborate Crop Control act of 1938 which had for its purpose what Secretary Wallace called the "ever normal granary," that is, the maintenance of a fairly steady ratio between the production and consumption of the chief surplus crops of the United States: wheat, corn, cotton, tobacco and rice. The government was to store the surplus in fat years and release it in lean years, extending loans of the stored surpluses through the Commodity Credit corporation. A novel feature of the act was the provision for a referendum among the raisers of the crops in question to determine whether or not they agreed to the quotas of production which were fixed by the Agricultural administration.

In June 1938 congress passed a Fair Labor Standards act (or Wages and Hours act) for industries entering into interstate commerce. The act was designed to "put a floor under wages and a ceiling above prices." Wages were to increase from a minimum of 25 to 40 cents an hour, and hours to decrease by the same sliding scale from a maximum of 44 to 40 a week. But in spite of these major measures, opposition to the president's program went on. A combination of Republicans and anti-New Deal Democrats slashed hundreds of millions from appropriation bills, defeated the reorganization of the executive departments, refused to amend the Neutrality act, ignored the request for the establishment of six regional projects like the TVA and so amended the tax bill of 1938 in favour of the corporations that the president allowed it to become a law without his signature.

As the head of his party the president deemed it proper to intervene in the primaries of 1938 by letters, conferences and speeches, to eliminate certain discordant Democrats (notably Sen. Millard Tydings of Maryland, Ellison Smith of South Carolina, Walter George of Georgia and Guy Gillette of Iowa and Rep. John O'Connor of New York) from congress. This course, taken against the advice of Chairman James Farley, proved to be a boomerang. All the senators attacked were easily renominated and re-elected, while two prominent New Deal senators (James Pope of Idaho and William McAdoo of California) were defeated. Farley had predicted that the Republicans might gain 40 seats for the 76th congress, but they actually increased their numbers from 89 to 170 in the house, and gained 8 seats in the senate. They elected 11 governors, and outside the "solid south" polled 51.5% of the popular vote, as compared with 40.1% in the election of 1936.

WORLD WAR II

The Problem of Neutrality.—The outbreak of war in Europe with Adolf Hitler's invasion of Poland on Sept. 1, 1939, and the immediate declaration of war on Germany by Great Britain and France brought a decided change in the attitude of the American people toward the foreign policy of the administration.

Since his inauguration in 1933, Pres. Franklin D. Roosevelt had subordinated questions of foreign policy to his battle for the reforms of the New Deal. To meet the overwhelming desire of the American people to keep out of war in any part of the world, congress had in the years 1935–37 provided the most stringent neutrality legislation in the nation's history. Deprived of discretion to discriminate between "aggressor" and "nonaggressor" belligerents, the president had asked the 76th congress in its first session (Jan. 3–Aug. 5, 1939) to rescind the mandatory provisions of the Neutrality act of 1937. On July 11 the senate committee on foreign relations declined, by a vote of 12 to 11, to consider any changes in the law.

When the war came, Roosevelt, eager to keep the United States out of it but convinced that the only way to do so was to give all aid possible to France and Great Britain, called the congress in extra session on Sept. 21, 1939, for the purpose of amending the neutrality legislation. He wished to keep the "cash and carry" provision and the denial of war credits to belligerent nations. He approved barring U.S. merchant ships from combat areas. But he pleaded that the embargo on arms be lifted in order that aid might be given nonaggressors. After a spirited debate, the senate on Oct. 27 repealed the embargo by a vote of 63 to 30, and the house concurred a few days later.

National Defense.—After the outbreak of World War II in Europe, the Latin-American republics were inclined to foster closer relations with the United States. Latin-American nations at the conference of Panamá in Oct. 1939 took a long step toward hemispheric defense in agreeing to pool their navies to patrol the 6,000 mi. of the eastern coast of South America from the mouth of the Amazon to Cape Horn. At Havana, Cuba, the following July, they adopted the policy announced by the United States of not recognizing the transfer of any region of the western hemisphere from one non-American power to another, and agreed to consult for the protection of any of the republics which might be threatened by subversive activity.

On May 28, 1940, as France was succumbing to the drive of the German armies which had previously swept through Denmark, Belgium and the Netherlands, President Roosevelt set up an advisory Council of National Defense with six cabinet members and seven expert industrial advisers.

When Hitler took Paris in June 1940, a Gallup poll indicated that 64% of the American people favoured military training in contrast with 37% favouring it after the Munich agreement of Sept. 1938. The Selective Service and Training bill introduced into the congress provided for the registration of men between the ages of 21 and 35 inclusive, no more than 900,000 to be called into service at any one time during peace. The act was to expire on May 15, 1945. Opposition was strong, but the bill passed by majorities of about two to one and was signed by the president in Sept. 1940. The drawing of numbers began on Oct. 29. For the first time when the nation was not actually at war, the government resorted to compulsory military service.

The problems of national defense absorbed the attention of the administration increasingly during 1940 and 1941, affecting not only the policies of the army and the navy, but also the whole field of production, transportation, labour, finance and education. Late in 1940, as defense preparations were lagging, a "supercommission" of four was created as the Office of Production Management. After the United States formally entered the war, the president appointed Donald M. Nelson the head of a new War Production board.

The Election of 1940.—Despite the fact that the precedent of no more than two terms in the presidency seemed to be firmly established, the critical situation in 1940 led most of the Democratic leaders to insist that Roosevelt should run for a third term. The president, himself making no move to secure or refuse the nomination, was unanimously nominated on the first ballot at the convention in mid-July. Secretary of Agriculture Henry A. Wallace was named as his running mate. The chief Republican aspirants were Sen. Robert A. Taft of Ohio, Sen. Arthur Vandenberg of Michigan and Thomas E. Dewey of New York. The Republican national convention, however, responded to a widely supported movement for Wendell Willkie, president of the Commonwealth and Southern Utilities corporation, and nominated him on the sixth ballot with Sen. Charles L. McNary of Oregon as the candidate for the vice-presidency.

Willkie aroused great enthusiasm by a vigorous and forthright campaign, but his cause was weakened by the fact that he had had no experience in political life. He polled 22,305,198 votes to Roosevelt's 27,244,160 in the election in November, but carried only 10 states with 82 electoral votes to 449 for his opponent. The election made little change in the new congress, the Democrats gaining 7 seats in the house and the Republicans, 5 in the senate. The vote for minor parties (Socialist, Communist and Prohibition) was insignificant.

Aid to Great Britain.—In Sept. 1940 President Roosevelt had transferred 50 destroyers to Great Britain in exchange for leases for naval bases at eight points on the Atlantic coast from Newfoundland to British Guiana. He told the first session of the 77th congress in Jan. 1941 that the United States must become the "arsenal of democracy." A few days after it had assembled, the house received bill 1776 calling for supply to the enemies of Hitler to help them win the war. Despite opposition by the noninterventionists, the Lend-Lease bill was passed in March 1941. The ties between the British Commonwealth and the United States became stronger. Prime Minister Winston Churchill and President Roosevelt met on the Atlantic ocean off the coast of Newfoundland on Aug. 14, 1941, and drew up the "Atlantic charter."

The Japanese Attack on the U.S.—The relations of the United States with Japan had for a decade grown steadily less friendly. On Jan. 26, 1940, the U.S. had abrogated its commercial treaty of 1911 with Japan. Yet Americans continued to sell to Japan materials Japan was using in its war against China. When Japanese armies invaded French Indochina in Sept. 1940, with the apparent purpose of establishing bases for an attack on the East Indies, the U.S. placed an embargo on scrap iron and steel intended for shipment to Japan. Japan retaliated by signing a triple alliance agreement with Germany and Italy (Sept. 27). Japanese Foreign Minister Yosuke Matsuoka, though asserting that his country wished to preserve peace with the United States, acknowledged that if the axis powers should become involved in war with the United States, Japan would be in duty bound to join them.

Meanwhile, the transfer of the 50 destroyers to Great Britain, the repeal of neutrality legislation, the aid given in the Lend-Lease act, occupation of the Danish islands of Greenland and Iceland as lying in waters "necessary for the defense of the United States" and the patrol of North Atlantic waters by U.S. destroyers —all these were in effect warlike measures against Germany, and the Germans did not hesitate to retaliate. During 1941 they sank American merchant vessels and launched torpedoes at three U.S. destroyers. President Roosevelt did not ask the congress for a declaration of war, but on Sept. 11 he gave orders to naval vessels protecting lines of commerce to "shoot at sight" on any hostile craft.

Although the administration had anticipated a possible attack by Japan somewhere in the Pacific, both the American government and its military advisers were surprised when Japanese planes descended on Pearl Harbor, T.H., on Sunday morning, Dec. 7, 1941. In this attack, 3 American battleships were destroyed, 16 other war vessels were sunk or disabled, grounded planes were destroyed and about 3,000 casualties were inflicted. Simultaneous attacks were made by the Japanese on the Philippines (Manila falling at the beginning of Jan. 1942) and on Wake, Guam and Midway Islands in the Pacific. On Dec. 8 the congress of the United States declared war on Japan with a single dissenting vote. (For military events of the war, *see* WORLD WAR II, especially *After Pearl Harbor.*) (D. S. MU.; E. E. R.)

Following the Japanese attack on Pearl Harbor, the president asked congress for a formal declaration of war on Germany and Italy. As a result of conferences between the president and Prime Minister Churchill later that month, a union of nations (originally 26) was formed early in 1942 and plans were made for joint conduct of the war.

The Nation at War.—The first year of the war for the United States was one of disaster, of mounting defeat and of definite uncertainty as to the outcome. It was not until a year after American entrance into the war that the axis powers had been placed upon the road to defeat. This did not mean that the Allies had won, although by Nov. 1942 in Africa, Europe and Asia the tide had turned. The year 1943 was one of continuous advance against the enemies everywhere. In May the Allies achieved control of North Africa and were preparing for the attack upon Italy. In early July, Sicily was invaded and the advance upon the mainland of southern France began. Two months later Italy surrendered. Meanwhile, the battle of the Atlantic had been won. Likewise, the spring and summer of 1943 witnessed the advance of American forces in the islands of the Pacific. This was accompanied by such destruction of Japanese ships and planes as to ensure early exhaustion of Japanese naval and air power.

In 1943, the year of conferences, six major meetings took place. At Casablanca in January, when the decision was made to invade Italy, came the declaration for "unconditional surrender." In May in Washington, D.C., came the decision to increase the bombing of Germany. At Quebec in August came the decision to invade German-occupied France in a "second front" and to launch a far eastern military expedition under joint control. In October Secretary of State Cordell Hull journeyed to Moscow and there, with Foreign Secretary Anthony Eden of Great Britain and Foreign Commissar Vyacheslav Molotov of the U.S.S.R., made a preliminary agreement for the establishment of the United Nations organization, together with declarations favourable to setting up democratic regimes in Italy and Austria and a demand for trial and punishment of war criminals. At Cairo in November Roosevelt and Churchill, meeting with Pres. Chiang Kai-shek of the republic of China, affirmed a war against Japan until its unconditional surrender. Territories taken from China were to be restored, China was to have control of Manchuria and it was agreed by the three powers that in due course Korea was to be free and independent. Later in the month at Tehran, Roosevelt, Stalin and Churchill

agreed upon plans for the launching of the second front in Europe.

In June 1944 a cross-channel landing took place in the invasion of German-occupied Normandy. By the end of August most of France was occupied by Allied forces, and Belgium and Luxembourg as well. In August, at Dumbarton Oaks in Washington, D.C., representatives of the United States, Great Britain, the U.S.S.R. and China met and agreed upon a charter for a permanent international organization for the maintenance of world peace and security. In mid-September President Roosevelt again met with Prime Minister Churchill in Quebec, and they tentatively agreed upon plans for dealing with Germany after the war. Summer successes of 1944 in the Pacific were followed by re-entrance of American forces into the Philippines in October. When the year 1945 opened, it was clear that the invasion of the islands of Japan was soon to come.

Election of 1944.—Once before in national history a presidential election had been held while the issue of war was in the balance. As in 1864, so in 1944 there was no thought on the part of responsible leaders that the election would not be held. Indeed, there were men who felt a greater need of the elective process because of the fourth-term candidacy of President Roosevelt. Prior to his nomination, in his messages to congress, the president had made clear his program for peace as well as for war. He pointed out that the costs of war, thus far, had been six times the costs of World War I. He estimated that the actual war cost would exceed $200,000,000,000 by the middle of the year. At the same time looking to the future, he called for a "five-point plan" to deal with the days of peace to follow the war. He envisaged a vast government spending plan and a new eight-point economic "bill of rights." These were to include the right to a job—to earn money for adequate food, clothing and recreation. For farmers, there was to be a decent living; for businessmen, freedom from unfair competition. There was to be protection for all in old age and during sickness and unemployment.

In mid-February congress had passed a tax bill which, although approved by both administration and legislative party leaders, did not meet the plans of the president. His veto message caused a violent outburst in the press and among his own party supporters. The bill was passed over his veto by overwhelming majorities.

The year was marked by violent labour disputes and long-drawn-out controversy between the president and his representatives and the representatives of organized labour (in particular, musicians and coal miners) and of business. Each added some uncertainty to a wartime election.

In their national convention held in June, the Republicans nominated Gov. Thomas E. Dewey of New York, with Gov. John W. Bricker of Ohio as the vice-presidential candidate. As had been expected for several months, the Democratic convention meeting in July nominated Franklin D. Roosevelt for a fourth term. The vice-presidential candidate was not the incumbent, Henry A. Wallace, but Sen. Harry S. Truman of Missouri.

Labour took an unusually active part in the campaign. The Political Action committee (P.A.C.) and Congress of Industrial Organizations (C.I.O.) had been active in the preliminary campaign for Wallace as vice-presidential candidate, and in October Philip Murray of the C.I.O. and Sidney Hillman of the P.A.C. issued statements calling on labour to support the Democratic ticket.

There had been early discussion of the "soldier vote," estimated at nearly 10,000,000. Various devices were used to poll it, but it did not change the final result, which was decisive. Roosevelt polled 25,602,504 votes to 22,006,285 for Dewey. Only 367,474 votes, or less than 1%, were cast for other parties. It was notable that, although the electoral majority was overwhelming (432–99), the minority vote was not only great (45.9% of the total vote), but spread over two-thirds of the nation. Congress remained in the possession of the Democrats.

AFTERMATH OF WORLD WAR II

End of the War.—Most important in 1945 were events that brought the end of the war. Second in importance were problems of inter-Allied co-operation. President Roosevelt, in February following his fourth inauguration, met with Marshal Joseph Stalin and Prime Minister Churchill at Yalta in the Crimea. There, policies were agreed upon to enforce the unconditional surrender of Germany; to divide it into zones for occupation and policing by the respective Allied forces; to provide for reparations from Germany; and to establish a United Nations organization. A series of secret agreements made at the Yalta conference were later revealed. Chief among these was the agreement that the U.S.S.R. would enter the war against Japan after the German surrender, the condition being a restoration and increase of Russian influence in the far east. (*See* YALTA CONFERENCE.)

President Truman.—Upon the death of President Roosevelt on April 12, 1945, scarcely three months after the beginning of his fourth term, Harry S. Truman became president of the United States. The problems he faced were known to him only in a general way, for he had not had close association with the administration. The United Nations conference took place as planned, opening on April 25 in San Francisco. On May 7 all German forces were unconditionally surrendered. On July 2 President Truman presented the United Nations charter to the senate. Five days later he sailed for Europe, where he met at Potsdam with Stalin and Churchill (later succeeded by Clement R. Attlee) to discuss the surrender ultimatum addressed to Japan and to plan for the control of Germany and the adjustment of various European territorial problems.

The Problem of World Peace.—In the preliminary steps toward the establishment of a United Nations organization there had been disagreements as to forms and procedures, and in particular as to the location of headquarters, finally established at New York city. By the end of the year the question of the veto (by any one of the five permanent members of the Security council) had become the leading problem. The Russians insisted that the veto power of one member might be used to oppose even a motion to permit debate. The Russian position upon the matter of debate was finally relaxed, and a compromise was reached as well on the demands of the small powers for greater influence, especially in amending the charter of the UN. Preliminaries for the United Nations charter had been approved by the house on June 7. The charter was approved by the senate on July 28.

The Atomic Bomb.—Japan having failed to respond to the Potsdam surrender ultimatum, an American plane dropped a single atomic bomb on the city of Hiroshima. Two days later the Russians declared war on Japan, advancing upon Manchuria and Korea. A second atomic bomb dropped on Nagasaki on Aug. 9 brought the surrender of the Japanese, which was signed on the battleship "Missouri" in Tokyo harbour on Sept. 2. The American armed forces, except those assigned to occupation of Germany and Japan, were speedily returned home. Russian forces were strongly entrenched in eastern Europe and in the far east, positions the significance of which was later revealed by unfolding events.

The Congress.—The domestic problems that pressed at once upon President Truman were the demands of labour and the danger of inflation following removal of wartime controls in an immediate effort to return to a peace economy. The 79th congress, however, passed few of the president's major recommendations. A number of southern Democrats who were opposed to continuance of New Deal policies joined the Republican minority on occasion to form an opposition bloc. The congressional elections of 1946 were of unusual interest because Truman's leadership had never been tested, and because shifts in domestic policies following the end of the war had given new impetus to both political parties. There was more interest on the part of the voters than in 1942, as was evidenced by a vote greater by nearly 7,000,000. The Republicans carried 30 states and gained control of both houses of the congress.

Legislation reducing taxes passed by the 80th congress was vetoed by President Truman, as was the Taft-Hartley bill, although the latter was subsequently passed over his veto. This legislation banned the closed shop forbidding the hiring of nonunion men; permitted employers to sue unions for broken contracts or damages inflicted during strikes; required unions to observe a 60-day "cooling-off" period before striking; required unions to make public their financial statements; forbade union contributions to

political campaigns; ended the collection of union dues by employers; and required union leaders to take oath that they were not members of the Communist party.

Other action taken by congress in 1947 included the proposal, for ratification by states, of a constitutional amendment limiting the presidency to two terms (ratified in Feb. 1951 as the 22nd amendment); a law fixing the presidential succession, after the vice-president, in the speaker of the house and then the president pro tem of the senate; an act merging the armed forces into a single department of defense. The congress approved a $400,000,000 appropriation to implement what came to be called the Truman doctrine, a proposal to bolster by economic and military aid—in this case to Greece and Turkey—countries threatened by Communist domination. This was followed by a broader plan that came to be known as the Marshall plan, inasmuch as it was first proposed by Secretary of State George C. Marshall. The billions voted by congress beginning in April 1948 were administered under an Economic Cooperation administration, and within a few years the nations of western Europe which benefited were recovering their productivity.

A major episode in the continuing "cold war" with the Soviet Union occurred during 1948–49, when the Russians blockaded all land traffic between west Germany and the Allied sectors of Berlin. The U.S. and Great Britain were, nevertheless, able to maintain a gigantic air lift for the delivery of food and supplies. The blockade was officially ended in May 1949. On Sept. 21, U.S. military government in Germany was replaced by a high commission.

Election of 1948.—The election of 1948 was marked by unusual features. A considerable number of the Democratic party organization members were opposed to the nomination of Truman. Some disagreed with his policies, both domestic and foreign; others were convinced that his defeat was a certainty. Many of those differing with his policy in foreign affairs, particularly with the utterances of the administration in the political conflict with the U.S.S.R., united in supporting an independent movement, eventually presenting Henry A. Wallace as a candidate on the platform of a newly formed Progressive party.

The more extreme members of the Democratic party in a number of southern states left the Democratic convention after the adoption of a platform stressing civil rights and formed an independent party, the States' Rights Democrats (Dixiecrats), and nominated Gov. J. S. Thurmond of South Carolina for president. The national Democratic convention renominated Truman with Sen. Alben W. Barkley of Kentucky as vice-presidential candidate, and called for repeal of the Taft-Hartley act.

The Republican party entered the campaign confident of success, and after a sharp contest in convention, united in supporting Gov. Thomas E. Dewey of New York for president and Gov. Earl Warren of California for vice-president. The Republican campaign was listless, the candidates calling for retention of the Taft-Hartley act and for a limitation upon the activities of the federal government. President Truman campaigned actively and with unusual vigour. The result was unexpected, for all public opinion polls had indicated Truman's defeat. Despite his loss of four states because of States' Rights defection (1,169,021 votes) and the loss of 1,156,103 votes (presumably nearer Democratic than Republican) cast for Wallace, Truman won 24,105,695 votes (303 electoral votes) to 21,969,170 for Dewey (189 electoral votes).

Second Administration of Truman.—Both houses of the 81st congress were Democratic as they organized in Jan. 1949. The president called for a vigorous advancement of his Fair Deal program to aid underprivileged people by housing, full employment and higher minimum wages, higher price supports for farmers, conservation of water power and an extension of social security. With the exception of the Social Security act of 1950, which added almost 10,000,000 persons to the beneficiaries of old-age insurance, only a small part of the Fair Deal was achieved.

Additional funds were voted for the economic recovery program and for national defense, but proposals for higher taxes were defeated. In foreign affairs, bipartisan co-operation continued. Congress in July 1949 ratified the North Atlantic treaty which had been signed in Washington, D.C., by the foreign ministers of the United States, Great Britain, Canada, France, Belgium, the Netherlands, Luxembourg, Italy, Denmark, Norway, Iceland and Portugal, obligating the signatories to rearm under a system of integration in an organization known as NATO. (Greece and Turkey joined in 1952.)

The congressional campaign of 1950 was carried out largely on local, regional and personal issues. Democrats retained control of both houses, but by a sharply reduced margin in the house and by only two seats in the senate.

THE ATOMIC AGE

Aggressive American Policy.—The collapse of nationalist China in 1949 as Communist forces swept Chiang Kai-shek's army from the mainland, and the announcement in September that an atomic explosion had taken place in the U.S.S.R.—these gave added impetus to President Truman's Point Four program for aid to impoverished nations. This program was launched in 1950. In January of that year the president announced that he had asked the U.S. Atomic Energy commission to produce a hydrogen bomb, which would be vastly more powerful than an atomic bomb. (*See* ATOMIC ENERGY, especially sections beginning with *The Atomic Bomb Project.*)

The Korean War.—On June 25, 1950, forces of the Korean People's Republic, supported by Soviet Russia, advanced south of the 38th parallel separating the northern Communist state from the southern Republic of Korea established in 1948. The issue was presented by the United States to the United Nations, where strong measures were advocated to suppress "aggression" in Korea.

Led by the United States, the Security council (the Russian member not attending) voted for intervention by armed forces of the United Nations. Under the command of Gen. Douglas MacArthur, the campaign for liberation of South Korea commenced satisfactorily and the Communist North Korean forces were driven back north of the 38th parallel. As the year ended, however, the situation in North Korea was reversed, and the United Nations armies were forced into a costly and precarious retreat by overwhelming forces of the Chinese Communists, whose entrance into the struggle had been foreseen as a possibility but was not expected. (*See* KOREAN WAR.)

The national situation of the United States, as the leader in an attempt to suppress aggression by Communist forces in the far east, now became critical, and congress supported the president in a gigantic program for defense. On Dec. 16, 1950, President Truman declared a national emergency and outlined plans for placing the nation on a war basis. In the same month Gen. Dwight D. Eisenhower was appointed commander of the new supreme headquarters of the Allied powers in Europe (SHAPE), charged with creating effective military forces for the North Atlantic Treaty organization as a deterrent to Communist aggression in western Europe.

General MacArthur, whose view of the conduct of the war in Korea was in sharp contrast with the policy of the administration, was recalled from his commands by President Truman on April 11, 1951. MacArthur was succeeded in all commands by Lieut. Gen. Matthew B. Ridgway, commander of the U.S. 8th army in Korea, who was later promoted to general. Armistice talks to end the Korean war began on July 10, 1951, but not until July 27, 1953, was the armistice signed. Three years of war ended with more than 140,000 U.S. casualties. After further difficult negotiations over the status of prisoners, an exchange operation was completed by Sept. 6, 1953. Efforts to negotiate the unification of Korea later ended in failure at Geneva, Switz. (June 1954).

Cold Peace.—The United States had taken the lead in concluding a peace treaty with Japan, which was signed in San Francisco on Sept. 8, 1951, by 49 nations including Japan. Japan and the U.S. agreed upon a bilateral security treaty which provided that U.S. troops could be stationed in Japan for an indefinite period. The U.S. also signed defense pacts with Australia and New Zealand. On July 1, 1952, the senate ratified a peace agreement between western Germany and the western Allies. Eastern Germany remained under the control of the U.S.S.R. An "iron curtain" was drawn by the Soviet Union between eastern and western Europe.

Election of 1952.—On April 8, 1952, President Truman had ordered Secretary of Commerce Charles Sawyer to seize control of the nation's steel mills in order to avert a strike in the industry. But on June 2 the U.S. supreme court held, by a vote of 6–3, that the executive order was unconstitutional, and the steel mills were returned to private management.

While he was serving in western Europe, General Eisenhower's name was entered in Republican state presidential primaries, a number of which he won. After he retired from his military post, his supporters campaigned actively for his nomination. Sen. Robert A. Taft was the other leading candidate of the Republican party. The national Republican convention was about evenly divided, but Eisenhower was nominated on the first ballot. Sen. Richard M. Nixon of California was named the Republican vice-presidential candidate. The Democratic national convention nominated Gov. Adlai E. Stevenson of Illinois and Sen. John Sparkman of Alabama as presidential and vice-presidential candidates. Like Eisenhower, Stevenson had been a reluctant candidate in the early stages of the preconvention campaign.

Eisenhower vigorously attacked the Democratic administration, charging it with responsibility for events leading up to the Korean war and for scandals among top administrators in the internal revenue bureau, justice department and other government offices. Charges of Communist infiltration in government offices were also made, although candidate Eisenhower never took such an aggressive role as did many Republicans including Sen. Joseph McCarthy of Wisconsin. President Truman carried on a whistle-stop tour, defending his administration and supporting Stevenson, who conducted an impressive campaign.

In the November election, the popular vote of more than 61,000,000 was the largest in the nation's history. In a landslide in the electoral college, Eisenhower swept 39 states (442 electoral votes), while Stevenson carried only 9 states (89 electoral votes). Eisenhower shattered several political precedents and carried the southern states of Florida, Virginia, Tennessee and Texas. The Republicans, who also gained control of the house, won a 48 to 47 margin in the senate, not including one independent Republican. Gubernatorial contests in 30 states resulted in Republican victories in 20 states. The Republican presidential candidate had run far ahead of his party ticket. Analysis of the vote indicated that portions of the labour vote that had been consistently Democratic for 20 years had gone to Eisenhower. It was evident, as well, that a substantial Negro city vote and a widespread middle western farm vote had supported the Republicans.

President Eisenhower.—Prior to the inauguration of Jan. 20, 1953, President Truman followed the procedure attempted by President Hoover in 1933 by inviting the president-elect to confer on foreign and domestic policies.

President Eisenhower in his inaugural address gave the clue to the course he was to follow. His middle-of-the-road policy in domestic affairs—weakening the influence of labour elements in

the Democratic party—tended to strengthen the more influential liberal elements in the Republican party. In foreign affairs the new president's tone was more aggressive, but his success in this field was largely personal. In the interim before inauguration he had made an inspection trip to Korea.

Eisenhower was not supported by the united action of his party members in house and senate. Most marked were his differences with the extreme "right" elements and the isolationists. The president won important victories in legislation only because of frequent Democratic support. Outstanding among his appointments was that of Gov. Earl Warren of California as chief justice of the supreme court.

The Eisenhower administration was marked by the appearance in Washington of men successful in business who became members of what was termed the president's "team." As an assistant and close aid to Eisenhower, Vice-Pres. Richard Nixon, who had been under unusually heavy attack during the presidential campaign, took an active part in the administration. No vice-president had performed for any previous president so many duties, nor had had so much knowledge of the president's procedures and decisions.

The administration was plagued throughout the first two years by political demonstrations of the senate subcommittee charged with investigation under the loyalty-security program. This was an outgrowth of Truman's loyalty order of March 22, 1947, for investigation of employees in the executive branch of the federal service. President Eisenhower took the basic position that loyalty and security maintenance were the responsibility of the executive. Yet he did not interfere with the sensational activities of the subcommittee whose chairman, Senator McCarthy, later became the subject of a special senate committee investigation. The senate voted 67–22 to "condemn" McCarthy for abuse of senatorial privileges.

The most important decision of the supreme court in a half century was that unanimously delivered on May 17, 1954, to the effect that racial segregation in elementary and secondary public schools in the United States was unconstitutional. This "desegregation" decision resulted in a division of sentiment in both political parties, especially the Democratic party.

The years 1953–56 were characterized by general prosperity. General confidence on the part of investment capital contributed to the fostering of conditions favourable to business development. The federal reserve system was restored to independence of the treasury and used its authority to check speculative activity in the stock market. The federal reserve also checked expansion of bank credit, bringing about "tight money" intended in turn to check inflation. The national budget was brought into balance, despite the president's program for defense, because he did not hesitate to maintain the necessary tax level. A beginning was made to rid agriculture of a burdensome surplus. Employment and earnings were high.

Foreign Policy.—President Eisenhower's attempts to improve international relations were ably seconded by his energetic and professionally equipped secretary of state, John Foster Dulles. Yet the administration met a series of defeats for the objectives of the United States. With the termination of the prolonged Korean armistice discussions in the summer of 1953, a cold stalemate prevailed in the far east. Events quite beyond the control of the president stayed his hand from shaping history in the far east, and Communist strength there continued to grow.

On the other hand, Eisenhower's "atoms for peace" plan launched in 1953 was a first step in advancing the results of the development of nuclear science for the welfare of the world. His proposals for international control of atomic armaments and his suggestion for open-sky inspection of military installations conferred an important initiative on the democracies in the controversy with Soviet Russia over arms limitation. The Geneva conference of the heads of the Big Four Powers in the summer of 1955 was dominated by Eisenhower's spirit of fair play and his insistence upon good faith. But the results were not conclusive.

The president's personal role in government was greatly altered in the months following his heart attack on Sept. 24, 1955. Although he gradually resumed the general responsibilities of the presidency, the temporary disability raised once more two questions which had never been quite absent from the discussions of the previous 25 years. The first was the increasing burden placed upon a president of the United States; the second was the calibre of men nominated as candidates for the vice-presidency.

Election of 1956.—The gradual return to health of the president was interrupted by a severe attack of ileitis and a surgical operation on June 9, 1956. Recovering, the president resumed his routine duties. Although there was wide discussion of his possible refusal to become a candidate for re-election, well in advance of the Republican national convention in August he let it be known that he would accept the nomination. This was unanimous and enthusiastically given. The short-term effort of Mutual Security Administrator Harold Stassen to prevent the renomination of Vice-President Nixon was unsuccessful, and Nixon was renominated as well by unanimous vote of the convention.

In the Democratic convention, held prior to the Republican convention, the contest for the presidential nomination was enlivened by the last-minute withdrawal of Sen. Estes Kefauver of Tennessee, who had made an impressive showing in several state primaries, and the decision of former President Truman to throw his support to the candidacy of Gov. Averell Harriman of New York. The former governor of Illinois, Adlai Stevenson, was nominated by the Democrats on the first ballot. He asked the convention to vote on the vice-presidential nominee and Kefauver was nominated.

The campaign that followed was shorter than usual because of the late dates of both conventions. In its early stages the campaign had few unusual features. President Eisenhower, by use of radio and television, was able to reach more voters than had Roosevelt in 1944 or Hoover in 1932. And in October the president embarked upon several cross-country speaking tours. Vice-President Nixon carried on an extensive nation-wide campaign, as did the Democratic nominees.

The issues raised by the Democrats—except for Stevenson's proposals, late in the period, to end hydrogen bomb tests and cut down the draft for Selective Service—did not arouse great national interest. Labour, as in previous campaigns, threw its official support to the Democratic ticket. Both parties in their national conventions had agreed upon moderate statements calling for gradualism in the problem of desegregation.

Late in October an apathetic electorate was aroused when eastern Europe and the middle east burst into flames. A crisis had come to the administration in September, following the seizure of the Suez canal in July by Egyptian Pres. Gamal Abdel Nasser and the counterefforts of France and Great Britain in protest. The subsequent outbreak of anti-Communist revolt in Poland; a violent anti-Communist revolution throughout Hungary; an invasion of Egyptian territory by national forces of Israel claiming self-defense against border depredations; the swift attack of Great Britain and France upon Egypt with the immediate purpose of regaining control of the Suez canal—all of these events were brought to bear upon the final days of the presidential campaign.

The electorate voted overwhelmingly for President Eisenhower. He carried all but seven states with a popular vote of 35,582,236 to Stevenson's 26,028,887. The Democrats, however, captured both house and senate, thus ensuring a divided government for the term beginning Jan. 20, 1957.

UNITED STATES AIR FORCE ACADEMY, an institution of higher education for the training of commissioned officers for the air force, was formally opened on July 11, 1955, at the academy's temporary headquarters at Lowry Air Force base, Denver, Colo. The academy's permanent site is 7 mi. N. of Colorado Springs, Colo.

The four-year curriculum, leading to a bachelor's degree and a second lieutenant's commission in the air force, covers traditional higher education as well as airmanship. Studies in subjects such as government, geography, history and philosophy were introduced, and the science courses range from the fundamentals of mathematics, physics and chemistry through the technical areas related to aeronautical engineering.

The airmanship program includes military training, intramural athletics, leadership and flight training. The flight training qualifies graduates in aerial navigation, entitling them to the wings of an aircraft observer. During the sophomore year, the cadets receive pilot training and, if still physically qualified, most graduates go to air force pilot training schools.

Any male citizen of good moral character who will be 17 years old but less than 22 on July 1 of the year he plans to enter the academy, who has never been married and who can meet the prescribed physical standards may compete for appointment to the Air Force academy. Roughly 85% of the vacancies, allocated to the states on the basis of congressional representation, are filled by competitive examinations among candidates nominated by United States senators and representatives. The remainder are filled by competitive examinations among candidates nominated by the president and vice-president, among members of the regular and reserve components of the air force and army, and sons of deceased veterans of the armed forces.

UNITED STATES COAST GUARD, THE: *see* COAST GUARD.

UNITED STATES COAST GUARD ACADEMY at New London, Conn., an institution of higher learning for the training of commissioned officers for the coast guard, was founded by act of congress in 1876, and embraces a four-year curriculum of liberal, theoretical and practical education. Prior to the advent of World War II, the Coast Guard academy had a cadet corps of between 200 and 300 cadets, but after the war many new duties with peacetime implications were added to the work under the administration of the coast guard, and enrollment at the academy was about 500 cadets in the latter 1950s.

Entrance to the Coast Guard academy, which is beautifully located overlooking the Thames river, is restricted to unmarried men between the ages of 17 and 22 at the time of their appointment. Unlike the naval and military academies, appointment to the Coast Guard academy is obtained exclusively through nationwide competitive examinations. There are no political nominations. Examinations are held late in February each year, and application to take the examinations must be made through the coast guard commandant, Washington, D.C. Prospective cadets are examined in mathematics, English and general adaptability. A rigid physical examination is given, and no cadet is accepted who stands less than 5 ft. 4 in. or more than 6 ft. 6 in. Coast guard cadets receive stipends to cover expenses and allowances for food. A cadet is required to deposit $100 upon entrance to the academy for uniforms, and a portion of his pay is put aside for the purpose of outfitting him at the time of his commissioning.

The new class enters the academy during the summer, usually in July. The "swabs," or fourth classmen, spend their first summer in becoming indoctrinated to military life. They are introduced to small boats, seamanship and military drill, in addition to attending their first classes, which include mathematics and history. While acute needs of the service early in World War II resulted in the adoption of an accelerated three-year curriculum, the Coast Guard academy later returned to a four-year course of intensive instruction. At the same time, the curriculum was revised along lines intended to liberalize the education of a cadet without reducing his theoretical and practical schooling. The subjects of instruction include mathematics, English composition, English and comparative literature, history, maritime economics, chemistry, physics, mechanics, electricity, radio, navigation, nautical astronomy, mechanical and ship drawing, naval construction, engineering, thermodynamics, marine engineering, engineering materials, seamanship, law, tactics, gunnery, ordnance and ballistics, communications and machine tool laboratory. The Coast Guard academy confers on its graduates the bachelor of science degree as well as a commission as ensign in the U.S. coast guard.

The present home of the Coast Guard academy was constructed in 1932 at a cost of more than $2,000,000, and was expanded, just prior to the war, at a similar cost. The buildings are of red brick in the Georgian colonial style, and centre around the administration building, Hamilton hall, named after Alexander Hamilton, the first secretary of treasury, who founded the coast guard in 1790. During World War II, ten temporary buildings were erected as quarters for a reserve officers' training school which graduated approximately 4,000 ensigns, a large percentage of them formerly coast guard enlisted personnel detached for officer training from assignments at sea. Facilities of this school were also utilized for special postgraduate work by both regular and reserve officers.

Although, as in any military establishment, discipline and regulations play a very important role, the life of a coast guard cadet has its lighter aspects. Among them are athletics, social events and cruises. In peacetime, the first and third classes make an annual extended summer cruise aboard the larger coast guard cutters, while the second class normally remains at the academy to assist in the indoctrination of the "swabs" and to go on a shorter cruise, generally along the New England coast. The Coast Guard academy's athletic program supports teams in basketball, baseball, boxing, cross country, fencing, golf, rifle and pistol, sailing, soccer, swimming, tennis and wrestling, with each cadet undergoing a rigorous training in physical education.

The cadets are organized in a battalion of five companies. The officers of the battalion are first classmen and the battalion organization plays an important role in the life of the cadet, for his official, social and recreational life centres about this basic organization. The highest honour which may come to any cadet of the academy is to be chosen battalion commander in his first-class year. The choice is based on such leadership qualities as honour, personality, tact, courage, truthfulness and military knowledge and bearing. (J. F. Fy.; X.)

UNITED STATES MERCHANT MARINE ACADEMY. The U.S. merchant marine corps was established in 1938 and the academy at Kings Point, N.Y., about 20 mi. E. of New York city, was dedicated on Sept. 30, 1943. Similar in many respects to the other federal academies, it prepares cadets to serve as officers in the merchant marine.

Graduates are licensed as either deck or engineer officers and receive the degree of bachelor of science. They are also eligible to apply for commissions as ensign in the U.S. naval reserve. A candidate for admission to the academy must be an unmarried U.S. male citizen, have reached his 17th but not 22nd birthday by July 1 of the year in which he seeks admission, be nominated by his congressman, take a competitive examination held annually in March, and meet rigid physical requirements.

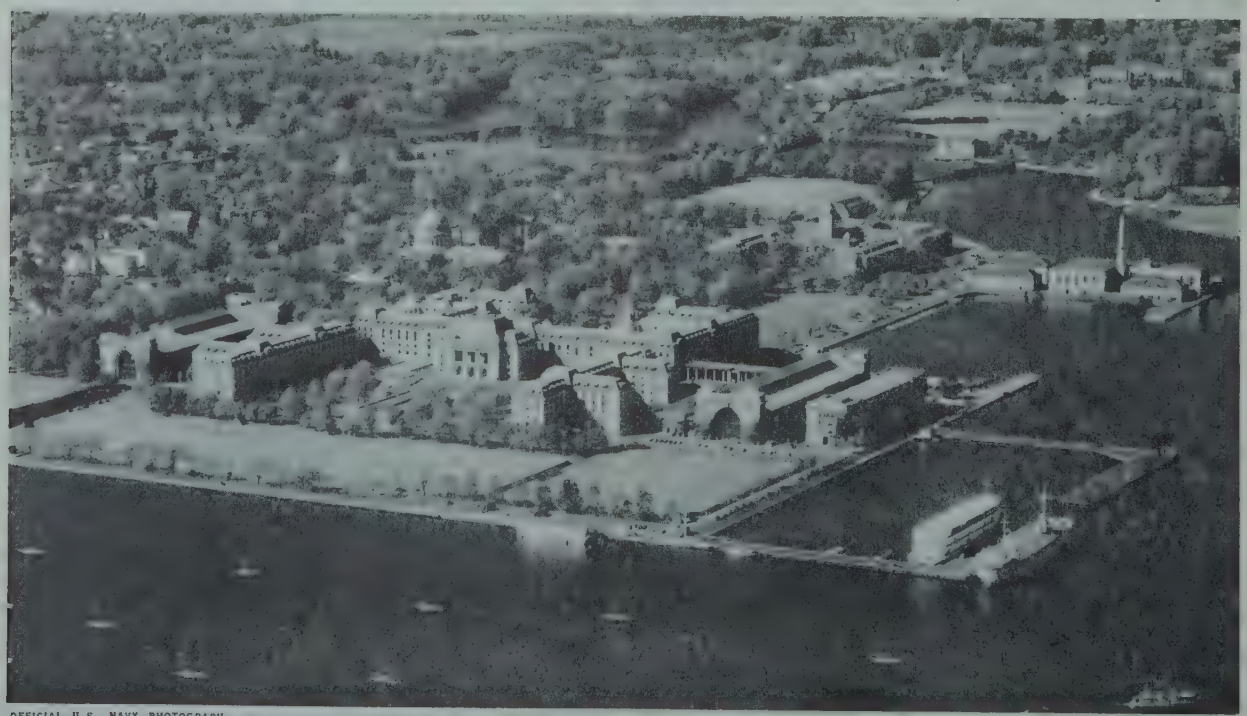
After the first year at Kings Point, cadets spend a full year at sea before returning to the academy for their second- and first-class years. The curriculum includes courses in nautical science, engineering, mathematics and science, ship management, history and languages, naval science and ship's medicine.

UNITED STATES MILITARY ACADEMY: *see* WEST POINT.

UNITED STATES NAVAL ACADEMY, an institution of college grade conducted by the U.S. navy department and located at Annapolis, Md., for the purpose of preparing young men to enter the lowest commissioned ranks of the navy and marine corps. The principal source of career officers, it was founded as the Naval school in 1845 by George Bancroft, historian, educator and secretary of the navy, to improve the then unsatisfactory methods of instructing midshipmen. At first the course was five years, of which only the first and last were spent at the school, the intervening three years being spent on board ships on active service. It was reorganized in 1850–51 as the U.S. Naval academy, with a course of study of four consecutive years. A summer practice cruise replaced the omitted sea service, and gave better opportunities for intensive training.

During the Civil War the academy was moved to Newport, R.I., but was brought back to Annapolis in 1865. In the following years great improvements were effected in the organization and curriculum. During the Civil, Spanish-American and World Wars I and II, the course was shortened to provide more officers for the fleets. During the latter two wars large classes of reserve officers were also trained at the academy.

Under the superintendent, the academy is organized into the following departments: the executive department, headed by the commandant of midshipmen, who is charged with interior discipline, drills and tactical instruction; and the academic departments



OFFICIAL U.S. NAVY PHOTOGRAPH

AERIAL VIEW OF THE U.S. NAVAL ACADEMY AT ANNAPOLIS, MD.

of seamanship and navigation, ordnance and gunnery, marine engineering, aviation, mathematics, electrical engineering, English, history and government, foreign languages, hygiene and physical education. The superintendent, commandant of midshipmen and the heads of the academic departments constitute the academic board, which determines policies. There are also medical, supply and public works departments, station ships, a hospital, a library, a museum and a rifle range.

Considering that the Naval academy does not attempt to produce specialists in any one subject, the course is equal to those of the best colleges and technical schools. Candidates are appointed upon nomination by the president from the United States at large, by the vice-president and from the several states and territories upon nomination by the senators, representatives and delegates in congress. Also, 160 each year may be appointed from the navy and marine corps and 160 from the naval and marine corps reserve by competitive examination; and 40 by competitive examination from among the sons of officers, soldiers, sailors and marines who died as a result of World Wars I and II. There are other sources of limited numbers of appointments available to candidates under conditions which are specific as to residence or service connection.

Entrance examinations are designed to admit competent graduates of first-class secondary schools. The physical requirements are rigid. A fourth-classman or "plebe" enters in June or July, between 17 and 22 years of age, and spends the summer in drills designed to fit him for his new environment. Of the next three succeeding summers, two are spent on two months' practice cruises in ships of various types assigned from the U.S. fleet, and one is devoted to aviation practical instruction both ashore and afloat, and there is a brief period of training in amphibious operations. The academic year runs from September to June. The course covers higher mathematics, physics, chemistry, engineering, naval construction, electricity, seamanship, communications, military and international law, elementary strategy and tactics, military tactics, aeronautics, ordnance and gunnery, navigation, English, naval history, modern history, government, French, Spanish, German, Italian, Portuguese or Russian, hygiene and physical education. Theoretical and practical instruction are fully integrated. Graduates are awarded the degree of bachelor of science.

Beginning in 1899 the academy was almost completely rebuilt. The buildings and grounds present a most pleasing appearance with the major buildings in granite, reinforced concrete, white brick and terra cotta, in the French Renaissance style, after the designs of Ernest Flagg. The U.S. Naval postgraduate school was moved from Annapolis to Monterey, Calif., in 1951.

UNITED STATES SHIPPING BOARD, a board created by an act of congress approved Sept. 7, 1916, entitled:

An act to establish a United States Shipping Board for the purpose of encouraging, developing and creating a naval auxiliary and naval reserve and a merchant marine to meet the requirements of the commerce of the United States with its territories and possessions and with foreign countries; to regulate carriers by water engaged in foreign and interstate commerce of the United States; and for other purposes.

Under the act the board was authorized to form a shipping corporation with a capital stock not exceeding $50,000,000, of which a majority was to be held by the United States, for the purchase, construction, equipment, lease, charter and operation of merchant vessels in the commerce of the United States. The act provided that the $50,000,000 to be placed at the disposal of the board would be raised through the sale of Panama canal bonds. The shipping corporation provided for in the act was incorporated under the name of the Emergency Fleet corporation, but in 1927 congress changed the name to the U.S. Shipping Board Merchant Fleet corporation.

In the spring of 1917, when the United States entered World War I, there were in the country 37 steel shipyards with 162 ways and 24 wooden shipyards with 72 ways, capable of launching vessels of 3,500 dead-weight tons. At the signing of the Armistice in 1918, there were in all 223 shipyards, steel and wood, with a total of 1,099 ways. At the close of the war the shipping board controlled a total fleet of 1,196 vessels of 6,540,205 dead-weight tons. These vessels were acquired by: (1) New ships built by the shipping board. (2) U.S. ships requisitioned on "time" and "bare boat" charters. (3) Seized German ships. (4) Commandeered Dutch ships. (5) Chartered neutral ships.

The shipping board is an independent department of the executive branch of the government. The powers given the board under the act to regulate the operation of common carriers by water make its powers not unlike those of the Interstate Commerce commission. However, it is expressly provided in the act that the board has not concurrent jurisdiction with the Interstate Commerce commission in matters within the latter's power.

Following the directions of congress, contained in the Merchant Marine act of 1916, as amended in 1920, the shipping board has gradually disposed of its vessels to U.S. citizens. Some vessels were disposed of with the obligation that the vessel would be used in a definite service and trade. The sale of some vessels carried with it the obligation to undertake alterations, betterments and reconditioning under approved plans and specifications.

UNITED SYNAGOGUE, the largest of the religious organizations of London Jews. It was founded by act of parliament in 1870. While the United Synagogue is confined in its direct spiritual, educational and charitable work to London, it exercises considerable influence over the Jews of the empire by reason of the high respect felt towards its chief rabbi, who is officially styled "Chief Rabbi of the United Hebrew Congregations of the British Empire." Besides the United Synagogue, there are the Spanish and Portuguese Jews' congregation, founded in 1657: principal synagogue, Bevis Marks, Aldgate (built 1699–1701) and its constituent synagogues; the West London Synagogue of British Jews (Reform), founded in 1841; the Federation of Synagogues, founded in 1887; the Adas Yisroel (ultra-Orthodox); the Liberal Jewish Synagogue, established 1910. Besides these organizations there are many independent synagogues.

The United Synagogue of America is a federation of Jewish congregations, sisterhoods and young people's organizations, in the United States, Canada and Cuba. It is the central agency for the exponents of what is popularly called conservative Judaism. It was founded in 1913 by the late Solomon Schechter, for the purpose of advancing the cause of Judaism in America and the maintenance of Jewish tradition in its historical continuity. It was incorporated on April 24, 1916. The United Synagogue of America does not endorse innovations introduced by any of its constituent bodies, yet embraces all elements essentially loyal to traditional Judaism. In 1918, the Women's league was organized with the object of advancing traditional Judaism by furthering Jewish education among women, by creating and fostering Jewish sentiment in the home, by promoting the observance of Jewish dietary laws and home ceremonials, Sabbath and festivals, and by generally strengthening the religious institutions of the home and the community. In 1921, the Young People's league was established for the purpose of enlisting the activity of the Jewish youth in the advancement of traditional Judaism by extending their knowledge of Judaism, deepening their devotion to its precepts and establishing closer relations between them and the synagogue; to foster a knowledge of Hebrew and to encourage an active interest in the Zionist cause. In 1951, the United Synagogue Youth was organized with the objective of providing a program of activities for the adolescents in the congregations affiliated with the United Synagogue. The objectives of this organization parallel those of the Young People's league. (R. SN.)

UNITS, DIMENSIONS OF: *see* DIMENSIONAL ANALYSIS.

UNIVERSAL. Universal words are those which can be applied to more than one particular thing (in the widest possible sense of "thing"); *e.g.*, the word "red" applies to more than one object, and the word "prime" applies to more than one number. Such words are sometimes called "universals." But it is more usual to call them "general words" and to reserve the title "universal" for that which each member of a given class must possess if the

same general word is to apply to them all. But what must they all possess? Is it something which exists in the same way that particulars exist? In one way it seems that this is how it exists, since, like a particular, it has a name which is a noun. But in other ways universals are quite unlike particulars; *e.g.*, redness, unlike red objects, cannot be picked up, and primeness, unlike prime numbers, cannot be multiplied. Then do universals exist at all? This question has been debated from the time of Plato.

Plato held that universals exist, and so was a realist (this use of the word is quite distinct from its application to those who hold that material objects exist; *see* REALISM). He called them "Forms" (εἴδη), and produced many arguments for their existence. One of his most important arguments was that goodness stands apart from and is more perfect than any of its manifestations on earth. Another, scientific rather than ethical, was that particulars are too shifting and changeable to be objects of precise knowledge; which therefore must be concerned with universals. A third argument was logical—namely, that there must exist a universal corresponding to every general word (or anyway to most general words). It is not obvious that these three arguments, if successful, would all establish the existence of the same kind of thing. For it is impossible to attain precise knowledge about all classes of particulars, so that the scientific argument would seem to establish the existence of universals which are fewer than and perhaps different in kind from the universals of the logical argument. Also, there is nothing ethical about redness, and it is only by a metaphor that particular red objects may be said to endeavour to realize it. Furthermore, Plato did not draw the important distinction between generality and abstractness. "Red" is general, but not abstract, since particular red objects are concrete; whereas "prime" is both general and abstract, since particular prime numbers are not concrete. So generality and abstractness do not always go together. It is not clear how much of the ethical part of Plato's theory depended on the generality of "good" and how much it depended on the abstractness of "good" when it is applied to particular virtues (which are obviously not concrete). In any case it certainly relied chiefly on a third feature of goodness; viz., that it is the ideal aim of human endeavour.

Plato's ethical approach had led him to attribute separate existence to his universals, since it seems that this is how ideals ought to exist. Aristotle used an abundance of logical arguments to prove that universals exist, not separately from particulars, but in them. This is a different variety of realism, which, as Aristotle pointed out, avoids some of the difficulties of Plato's variety. For instance, if manhood were a separate thing just like a man, then one could argue for the separate existence of a second manhood with as much justification as Plato had when he argued for the separate existence of ordinary manhood. This is the famous "third man" argument. Again, if a universal like redness is literally a separate thing, then, since it cannot manifest its complete self in all red particulars simultaneously, it seems to follow that none of these particulars can be completely red. This argument from literal participation was cited later by Anicius Boethius against Augustine's version of Platonic realism. Plato himself was aware of these two arguments. Probably he would have moved on to Aristotle's kind of realism if his approach had been more exclusively logical. For, apart from the difficulties of its rival, Aristotle's kind of realism is very persuasive in itself. Nobody would apply a general word to a group of particulars unless he had noticed something common to all of them.

Realism, in one of these two versions, was orthodox in the middle ages, the Aristotelian version tending to predominate after Thomas Aquinas. But meanwhile a third rival, which had been recessive in antiquity, took the field—this was nominalism (*q.v.*). Nominalists deny that universals exist, arguing that the existence of a general word does not imply the existence of a general thing named by it. The middle ages also saw the clear emergence of a fourth view, conceptualism (*q.v.*), which is sometimes regarded as a rival of nominalism and of the two varieties of realism. A conceptualist is one who holds that we have concepts or general ideas. Some conceptualists (*e.g.*, John Locke) say that we form these general ideas by abstracting a common element from each particular of a given class (hence he calls these general ideas abstract, but not for the same reason that numbers are abstract: the point is not that they are not concrete—though of course they are not—but that they are formed by abstraction). Clearly conceptualism is not incompatible with either variety of realism; Aristotle and his mediaeval followers, for instance, combined realism with conceptualism. Conceptualism can be regarded as a rival of realism only to this extent: a philosopher who asks the question "How is it that we are able to think and speak in general terms?" might hold that conceptualism provides the complete answer; then, if he had no other reasons for accepting realism, he would reject it.

Some would maintain that the only right approach to the problem is through the question just cited, which is a logical question (in the widest sense of "logical"). This view entails that there can be no other reason for accepting realism, so that supporters of this view would accept realism (usually the more sober, Aristotelian variety) only if they found that it was a necessary part of the answer to that question. Such an approach is characteristic of empiricism and particularly of empiricism since the time of John Locke. On the other hand, there have always been philosophers who have held that there are independent reasons for asserting or denying the existence of universals, reasons which they would call "ontological." For example, in the middle ages, while the Platonic tradition was still dominant, Platonism was associated with the immutability of moral standards, and Plato's Forms were sometimes interpreted as a limited number of fixed ideas in the mind of God.

It would be an exaggeration to say that the dividing line between these two kinds of approach to the problem is clearly marked. But philosophers have been made increasingly conscious of it by the various attempts to determine the powers and limitations of the intellect which have appeared since the Renaissance and particularly by the work of the logico-analytic school since the beginning of the 20th century. Consequently it is now more revealing to classify philosophers' treatments of this problem according to their approach rather than according to their conclusions. Those who think that ontology is partly an independent subject fit their solutions of the problem into metaphysical systems and perhaps give them connections with theological doctrines. Those who think that the only right approach to the problem is through logic are less ambitious. The most that they would claim is that the world must contain such features as recurrent similarities if we are to be able to think and speak as we do; and, if they call their inquiries ontological, this is only in order to emphasize that, though they cover far less ground than the traditional inquiries whose pattern was set by Plato, still they do cover part of the same ground. (D. F. P.)

UNIVERSALIST CHURCH, a body of religious liberals organized in the United States, and represented chiefly by parishes and churches in that country and Canada. A distinction should be noted between Universalism and the Universalist denomination. Universalism—the belief that the whole human race will be "saved"—was a doctrine of some of the greatest of the church fathers, notably Clement of Alexandria and Origen, and is held by many in other communions. The Universalist denomination arose in the United States in the latter part of the 18th century.

History.—The origin of this church is commonly associated with the landing and preaching of Rev. John Murray at Good Luck, N.J., in Sept. 1770. Murray, a disciple of James Relly (1720–78), a Calvinistic Universalist of London, was seeking refuge in the new world from sorrow and trouble. Persuaded that he should be an apostle of this new faith, he became an itinerant minister in Massachusetts, New York, New Jersey, Pennsylvania and settled in Gloucester, Mass. (1774). His Universalism was a protest against the doctrine of endless punishment.

Under the leadership of Hosea Ballou (1771–1852), the most influential minister of the sect for half a century, Universalists became largely unitarian and broke with the Calvinism of Murray. The first period of the denomination's history was controversial. Religious and sectarian feeling for and against Universalism was intense. After 1820, ministers and churches began to multiply; colleges, seminaries, and newspapers were established.

Doctrine.—The fundamental tenet of Universalism may be said to be the illimitable love and goodness of God, assuring triumph over evil in society and in the life of every individual. Following its organization, the denomination officially summarized the faith of its adherents four times. These brief statements permitting the widest possible variety of interpretation within the bounds of reason and conscience were: the Articles of Faith adopted at Philadelphia in 1790; the Winchester Profession, Winchester, N.H., 1803; the Boston Declaration, Boston, Mass., 1899; and the Washington Avowal of Faith, Washington, D.C., 1935.

The Avowal of Faith adopted at Washington in 1935, restated American Universalism without departing in essentials from historic convictions as follows: "The Bond of Fellowship in this church shall be a common purpose to do the Will of God as Jesus revealed it and to co-operate in establishing the Kingdom for which he lived and died.

"To that end We Avow Our Faith in God as eternal and all conquering love, in the spiritual leadership of Jesus, in the supreme worth of every human personality, in the authority of truth known or to be known, and in the power of men of good will and sacrificial spirit to overcome all evil and progressively establish the Kingdom of God.

"Neither this nor any other statement shall be imposed as a creedal test."

Emphasis on "the authority of truth known or to be known" expresses acceptance by Universalists of the application of scientific method to the realm of values and meanings. The affirmation of "the

supreme worth" of personality makes explicit the historic and continuing concern of Universalists for relations of justice and good will between individuals, races and differing religious groups. Standing within the Judeo-Christian tradition, Universalists, nevertheless, are committed to the conviction that valid religion is always universal and so not to be justly claimed as the only true revelation by any one religion. Seeking to express the universal spirit of Christianity, Universalists extend the hand of fellowship to world religionists of other historic faiths.

Universalist parishes govern themselves, but acknowledge the authority of The Universalist Church of America, constituted of its officers, a board of trustees, ordained clergymen, two lay delegates from each parish and officers of the state conventions, which are subordinate to the national organization.

By the latter 1950s there were more than 70,000 Universalists in the U.S. and Canada; the number of churches was approximately 400.

UNIVERSAL LANGUAGE. The term international language is generally used to denote a second, or auxiliary, language for international use. Hellenistic Greek, Church Latin and Arabic had, at various times, the status of international languages. French occupied a similar position in the 18th and early 19th centuries, particularly in diplomacy. Thereafter English gained prestige in diplomacy and became the language of commerce par excellence.

After 1875 interest in finding a universal language gained momentum. At mid-20th century opinions differed sharply on the question whether it should be a scientifically constructed language or a simplified form of a natural language, such as English. It was generally agreed that to become an international medium, a language must have: (1) a limited vocabulary; (2) a simple, regular grammar; (3) a consistent, phonetic spelling; and (4) a sizable body of living speakers. Obviously, a constructed language has the advantage with respect to points one to three, while a living language has it with respect to point four.

CONSTRUCTED LANGUAGES

Constructed languages devised from 1875 draw their vocabularies from the chief natural languages of Europe, more specifically from their Latin elements.

Esperanto and Ido.—In 1880 J. M. Schleyer published Volapük, which enjoyed popularity for a decade and then died. In 1887 L. L. Zamenhof published Esperanto. In 1907 Louis Couturat and Louis de Beaufront published a variant of Esperanto, which became known as Ido. An international committee, meeting in Paris, Fr., in 1907 "to select the best language for international use," proposed a modification of Esperanto "in the direction of Ido." This the Esperantists rejected. Between 1907 and 1950 more than 50 schemes were proposed for reformed Esperanto, reformed Ido or some other compromise, but none met with any success.

By 1950 the Esperantists could point to 5,000 published books and a number of journals. Short-wave news broadcasts in Esperanto averaged 150 a month. Theirs was the only constructed language which had a world-wide body of living speakers (about 1,500,000), was being taught in more than 600 schools by 7,000 teachers and was being used widely in international gatherings.

Interlingua.—Volapük, which had been displaced by Esperanto, did not die without leaving a heritage. The central Volapük academy, under the direction of W. Rosenberger, carried on valuable research into the best form of a constructed international language. In 1908 G. Peano became its director, and its name was changed to Academia pro Interlingua. Interlingua is a constructed language, consisting of the living Latin roots in all European tongues with modern word-order rules and without grammar.

Iala.—The International Auxiliary Language association was founded in 1924 in New York city, at the instance of the International Research council, by Mr. and Mrs. Dave Hennen Morris. In consultation with linguists in European and American universities, Iala carried on extensive research in natural and constructed languages, seeking to develop the field of interlinguistics as a recognized part of comparative linguistics. In 1951 it brought out an Interlingua-English dictionary in which the name "Interlingua" connotes an international language evolved from national languages. The dictionary contains 27,000 standardized international words, covering a general vocabulary and all special fields of the arts, sciences and technology. It was offered as the scientific foundation for further experimentation. An experimental grammar, too, was published. Later there followed the publication of Interlingua bulletins.

NATURAL LANGUAGES

English.—As early as 1789 Roland de la Platier predicted in a communication to the Academy of Lyon that American English would become the international language. Jacob Grimm (1785–1863) wrote, "English may rightfully be called a world language. Did not a whimsical, antiquated orthography stand in the way, the universality of this language would be still more evident."

Recognizing the force of Grimm's statement, the American Philological association in 1876 held a convention at Philadelphia, Pa., for the amendment of English spelling. In 1878 it published, with the approval of the British Philological society, a "fonetic alfabet," which was later called the S.R.A. (Spelling Reform association) alphabet. Its spokesman, Francis A. March, wrote, "The English language has gone farther than any other language in the simplification of grammar. Linguists should encourage and guide the process, so as to eliminate all irregular forms both in nouns and verbs."

In 1920 a North European Peace conference, meeting in Stockholm, Swed., polled the chambers of commerce of all European countries except England, France and Germany as to their choice for an international language. Of 44 replying, 5 voted for Esperanto or Ido, 1 for German, 1 for Spanish, 8 for French, 29 for a modified form of English. At the English Language congress, meeting in 1926 in Philadelphia, Charles Grandgent of Harvard university and W. A. Craigie of Oxford university discussed requisites for English to become the international language, namely, a limited vocabulary for international use and a consistent spelling.

Basic English.—In 1929 C. K. Ogden and I. A. Richards of Cambridge university published their system of teaching English by means of a basic list of 850 words, followed by a second list of 350. The words were selected, not by frequency count, but by a continuous process of defining specific words in terms of more general ones. Most of the 1,200 words occur in E. L. Thorndike's list of the 2,000 commonest words in the English language. Only 100 of them fall outside Thorndike's list of the 4,000 commonest words. The distinctive contributions of Basic are its use of a small number of verbs and its teaching materials and methods. In 1947 the British government, having decided to use Basic English as an auxiliary and administrative language for certain official communications, purchased the copyright for $92,000. During World War II Basic English was used to teach illiterates and non-English personnel in the armed services. How much more effective its use might have been, if it had included the use of phonetic spelling, can only be conjectured. (*See* also BASIC ENGLISH.)

Anglic.—In 1930 R. E. Zachrisson and associates at Uppsala, Swed., launched the Anglic movement. Utilizing the findings of Godfrey Dewey's frequency count of English speech sounds, they devised Anglic spelling, in which each sound is invariably represented by that letter or combination of letters by which it is most frequently represented in traditional spelling. Their textbooks, written in a limited vocabulary and Anglic spelling, proved very efficient in the teaching of English in Scandinavia.

In 1946 the Simpler Spelling Society of Great Britain and the Simpler Spelling Association of America agreed on a revision of the S.R.A. alphabet of 1876, in the direction of Anglic and designated it as World English spelling. In 1947 the British group began publishing a series of primers, which were used experimentally in some public and private schools in England and Wales. In 1949 a bill, introduced in the house of commons, asking the gov-

ernment to create a commission to investigate the problem of spelling and to propose a reformed system for official use, was defeated for second reading by only three votes.

Significant for the future role of English are two facts. First, after the end of hostilities in World War II, English-speaking troops remained in many countries. Second, in 1954 the Vatican authorized the use of English in certain portions of the Roman Catholic ritual, a concession made to no other language.

UNIVERSE OF DISCOURSE, in logic, is the limited sphere of reference within which an assertion is intended to hold good. Hence the alternative name, "limited universe." The expression "universe of discourse" was first introduced by A. De Morgan, who states his meaning as follows: "For the most part the objects of thought which enter into a proposition are supposed to be taken, not from the whole universe of possible objects, but from some more definite collection of them. Thus when we say 'All animals require air' . . . we should understand that we are speaking of things on this earth: the planets, etc. . . . not being included" (*Formal Logic*, ch. iv). George Boole and W. S. Jevons used the term in the same sense, namely, for a part of the real world. Subsequently the notion was extended so as to include also merely imaginary spheres of reference—the world of illusions, supernatural worlds, worlds of sheer madness and vagary, etc. (*see* W. James, *Principles of Psychology*, vol. ii, ch. xxi). In logic the question is of some importance in connection with the problem of the existential import of propositions, especially of categorical propositions.

See A. Wolf, *The Existential Import of Categorical Predication: Studies in Logic* (Cambridge, 1905).

UNIVERSITIES. The mediaeval Latin term *universitas* was originally employed to denote any community or corporation. When used in its modern sense of a body devoted to learning and education, it required the addition of other words, such as *magistrorum et scholarium*. In the course of time, probably towards the latter part of the 14th century, the term began to be used by itself, with the exclusive meaning of a lawfully recognized community of teachers and scholars. But the more ancient and customary designation of such communities in mediaeval times (regarded as places of instruction) was *studium* (and subsequently *studium generale*), a term implying a centre of instruction for all.

A university often had a vigorous virtual existence long before it obtained that legal recognition which entitled it, technically, to take rank as a *studium generale*.

The university appears to have started as a scholastic guild—a spontaneous combination, that is to say, of teachers or scholars, or of both combined, and formed, probably, on the analogy of the trades guilds and the guilds of aliens in foreign cities, which, in the course of the 13th and 14th centuries, sprang up in most of the great European centres. The design, in the first instance, was little more than that of securing mutual protection. And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its members from the extortion of the townsmen and the other annoyances incident in mediaeval times to residence in a foreign state.

It was a first stage of development in connection with these primary organizations when the chancellor of the cathedral or some other authority began to accord to other masters permission to open other schools than the cathedral school in the neighbourhood of his church; a further stage was reached when a licence to teach—granted only after a formal examination—empowered a master to carry on his vocation at any similar centre that either already existed or might afterward be formed throughout Europe —*facultas ubique docendi*.

It was a still further development when it began to be recognized that, without a licence from either pope, emperor or king, no *studium generale* could be formed possessing this right of conferring degrees, which originally meant nothing more than licences to teach.

Meaning of "Studium Generale."—In the north of Europe licences to teach were granted by the chancellor scholasticus or some other officer of a cathedral church; in the south it is probable that the guilds of masters (when these came to be formed) were at first free to grant their own licences, without any ecclesiastical or other supervision. Gradually, however, toward the end of the 12th century, a few great schools claimed, from the excellence of their teaching, to be of more than merely local importance. Practically, a doctor of Paris or Bologna would be allowed to teach anywhere; and those great schools began to be known as *studia generalia; i.e.*, places resorted to by scholars from all parts. Eventually the term came to have a more definite and technical significance. The emperor Frederick II in 1225 set the example of attempting to confer, by an authoritative bull, upon his new school at Naples the prestige which the earlier *studia* had acquired by reputation and general consent. Gregory IX did the same for Toulouse in 1229 and added to its original privileges in 1233 a bull by which anyone who had been admitted to the doctorate or mastership in that university should have the right to teach anywhere without further examination. Other *studia generalia* were subsequently founded by papal or imperial bulls, and in 1292 even the oldest universities, Paris and Bologna, found it desirable to obtain similar bulls from Nicholas IV. From this time the notion began to prevail among the jurists that the essence of the *studium generale* was the privilege of conferring the *ius ubicunque docendi*, and that no new *studium* could acquire that position without a papal or imperial bull. There were, however, a few *studia generalia* (*e.g.*, Oxford) whose position was too well established to be seriously questioned, although they had never obtained such a bull; these were held to be *studia generalia ex consuetudine*. A few Spanish universities founded by royal charter were held to be *studia generalia respectu regni*. The word *universitas* was originally applied only to the scholastic guild (or guilds) within the *studium*, and was at first not used absolutely; the phrase was always *universitas magistrorum* or *scholarium* or *magistrorum et scholarium*. By the close of the mediaeval period, however, the distinction between the terms *studium generale* and *universitas* was more or less lost sight of, and the term *universitas* began to be used alone.

ITALIAN UNIVERSITIES IN THE MIDDLE AGES

Rise of University of Salerno.—To understand why the earliest universities arose it is necessary to take account not only of their organization but also of their studies. By the 6th century the secular pagan schools of the Roman empire had been swept away. By the 12th, the cathedral and monastic schools which replaced them had attained to their highest degree of influence and reputation. But these schools taught only what was supposed to be necessary for the education of the priest and the monk. The *studia* arose out of efforts to provide instruction beyond the range of the cathedral and monastic schools. Salerno, the first great *studium*, became known as a school of medicine as early as the 9th century. Its medical system was originally an outcome of the Graeco-Roman tradition of the old Roman world. In the first half of the 9th century the emperor at Constantinople sent to the caliph Mamoun at Baghdad a collection of Greek manuscripts. These texts were translated into Arabic by Syrian Christians, and the Arabic was later rendered into Latin for the use of teachers in the west. Of the existence of such versions we have evidence, according to C. M. G. Bréchillet-Jourdain, long before Constantine the African (d. 1087) began to lecture on medicine at Salerno. Under his teaching the fame of Salerno as a medical school became diffused all over Europe. It was distinguished by its catholic spirit; at a time when Jews were the object of religious persecution throughout Europe, they were to be found both as teachers and learners at Salerno. In 1231 it was constituted by the emperor Frederick II the only school of medicine in the kingdom of Naples. It remained a medical school only. "Nothing approaching a

regular university ever existed there" (H. Rashdall, *The Universities of Europe in the Middle Ages*, vol. i, part 3, p. 82).

Bologna.—The great revival of legal studies which took place at Bologna about the year 1000 had been preceded by a corresponding activity elsewhere—at Pavia by a famous school of Lombard law and at Ravenna by a yet more important school of Roman law. In Bologna itself we have evidence that the *Digest* was known and studied before the time of Irnerius (1100–30), a certain Pepo being named as lecturing on the text about the year 1076. The secular character of this new study and its close connection with the claims and prerogatives of the western emperor aroused papal suspicion, and for a time Bologna and its civilians were regarded by the church with distrust. But the appearance of the *Decretum* of Franciscus Gratianus, about 1140, invested the studies of the canonist with fresh importance. It was quickly regarded as official canon law, and so numerous decrees of past and almost forgotten pontiffs now claimed to take their stand side by side with the enactments contained in the *Corpus Juris Civilis*. They constituted, in fact, the main basis of those new pretensions asserted by the papacy in the course of the 12th and 13th centuries. It was necessary, accordingly, that the *Decretum* should be known and studied beyond the walls of the monastery or the episcopal palace. Such a centre of instruction was found in Bologna, which became recognized as the chief school of both civil and canon law. But the statement that university degrees were instituted there as early as the pontificate of Eugenius III (1145–53) rests on no good authority. The students found their first real protector in the emperor Frederick I, Barbarossa. Finding that their grievances were real, especially against the landlords in whose houses they were domiciled, he granted the foreign students substantial protection by conferring on them certain special immunities and privileges (Nov. 1158). These privileges were embodied in the celebrated *Authentica, Habita,* in the *Corpus Juris Civilis* of the empire (book iv, tit. 13), and were eventually extended to all the other universities of Italy.

Nevertheless, Bologna did not possess a university as early as 1158. Its first university was not constituted until the close of the 12th century. The "universities" at Bologna were, as H. S. Denifle has shown, really student guilds. These were originally only two in number, the *Ultramontani* and the *Citramontani,* and arose out of the absolute necessity under which residents in a foreign city found themselves of obtaining by combination that protection and those rights which they could not claim as citizens. Originally, they did not include the native student element and were composed exclusively of students in law. Denifle thinks that the "universities" at Bologna were at one time certainly more than four in number, and we know that the Italian students alone were subdivided into two—the Tuscans and the Lombards. In the centres formed by secession from the parent body a like subdivision took place. At Vercelli there were four *universitates,* composed, respectively, of Italians, English, Provençals and Germans; at Padua there were similar divisions into Italians, French (*i.e., Francigenae,* comprising both English and Normans), Provençals (including Spaniards and Catalans). According to Odofred, in the time of the eminent jurist Azo, who lectured at Bologna about 1200, the number of the students there amounted to about 10,000, of whom the majority were foreigners. It seems, therefore, reasonable to conclude that the number of these confederations of students (*societates scholarium*) at Bologna was yet greater.

The Rector.—In marked resemblance to the guilds, these confederations were presided over by a common head, the *rector scholarium,* an obvious imitation of the *rector societatum* or *artium* of the guild, but to be carefully distinguished from the *rector scholarum,* or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the guilds, again, the different nations were represented by their *consiliarii,* a deliberative assembly with which the rector habitually took counsel. The students at Bologna were mostly of mature years. As the civil law and the canon law were, at first, the only branches of study, the class they attracted was often composed of men already filling office in some department of the church or state —archdeacons, heads of schools, canons of cathedrals and like functionaries forming a considerable element in the aggregate.

About the year 1200 were formed the two faculties of medicine and philosophy (or the "seven liberal arts"), the former being somewhat the earlier. It was developed, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddeus Alderottus was especially eminent. The faculty of arts, down to the 14th century, scarcely attained to equal eminence. The teaching of theology at Bologna remained for a long time exclusively in the hands of the Dominicans, and it was not until the year 1360 that Innocent VI recognized the university as a *studium generale* in this branch.

The term "college" at Bologna long had a different meaning from that it now ordinarily conveys. The masters formed themselves into *collegia* (that is, organizations), chiefly for the conferment of degrees. Places of residence for students existed at Bologna at a very early date, but it was not until the 14th century that they possessed any organization; the humble *domus,* as it was termed, was at first designed solely for necessitous students who were not natives of Bologna. A separate house, with a fund for the maintenance of a specified number of scholars, was all that was originally contemplated. Such was the character of that founded by Zoen, bishop of Avignon, in Feb. 1256 (O.S.), the same month and year, it is to be noted, in which the Sorbonne was founded in Paris. It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the church, maintaining themselves in the university. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poor foreign students, without distinction as to nationality. The Spanish college was founded in 1364 for 24 Spanish scholars and two chaplains.

Other Italian Centres.—The earliest foundations in Italy after that of Bologna were the universities of Reggio nell' Emilia and Modena, both of which had flourishing schools of civil law before the close of the 12th century. Vicenza (founded 1204) and Padua (1222) both originated in migrations of students from Bologna. The University of Naples was founded by the emperor Frederick II in 1225 and was temporarily suppressed after his death. It was reconstituted in 1258. Piacenza, founded by papal charter in 1248, had little importance until 1398 when it was reconstituted by Galeazzo Visconti, duke of Milan, who caused the University of Pavia to be transferred to Piacenza. Pavia had long been famous as a school of Roman law, and for a time its fame was transferred to Piacenza. From 1404 to 1412 both universities ceased to exist. But after that date Pavia became almost as famous a school of civil law as Padua itself. Arezzo was a centre for legal study from 1215 to 1470. Rome (1303) had schools of canon and civil law for poor foreign students throughout the 14th and 15th centuries. Perugia (1308) specialized in civil law, Pisa (1343) was closed from 1403 to 1476, when it was reopened by Lorenzo dei Medici. The University of Florence (1349) had a brilliant existence in the first half of the 15th century, but was closed in 1472. Graduates of Siena, whose importance dates from 1357 though it was nominally founded in 1241, were accorded the same privileges as those of Bologna. Ferrara was famous in the latter half of the 15th century. The University of Turin was founded about the year 1400, that of Parma not until 200 years later.

PARIS IN THE MIDDLE AGES

Origin of University of Paris.—The commencement of the University of Paris well illustrates the fact that the universities arose in response to new needs. The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received about the year 1100 a powerful stimulus on two occasions—first from the memorable controversy between Lanfranc and Berengarius, and second from the no less famous controversy between Anselm and Roscellinus. The belief arose that intelligent appreciation of spiritual truth depended upon correct use of prescribed methods of argument. Dialectic was looked upon as the "science of sciences"; and when, somewhere in the first decade of the 12th century, William of Champeaux opened in Paris a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils

was Peter Abelard, in whose hands the study made a yet more notable advance. By the middle of the century John of Salisbury could say that all learned Paris had gone well-nigh mad in its pursuit and practice. Abelard taught first at the cathedral school at Notre Dame and later at the schools on the Mont Ste. Geneviève, of which he was the founder and where he imparted to logic its new development.

The schools out of which the university arose were those attached to the cathedral on the Île de la Cité and presided over by the chancellor—a dignitary who must be carefully distinguished from the later chancellor of the university. For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society and that special buildings were constructed for their classwork. The flame which Abelard's teaching had kindled was not destined to expire. Among his pupils was Peter Lombard, who was bishop of Paris in 1159 and widely known to posterity as the compiler of the famous volume of the *Sentences*. The design of this work was to place before the student, in as strictly logical a form as practicable, the views (*sententiae*) of the fathers and all the great doctors of the church upon the chief and most difficult points in the Christian belief. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refinement. It was probably this development of new methods of instruction concurrently with new material upon which to exercise them which finally distinguished the university from the cathedral schools.

Early Organization.—The University of Paris, as already stated, took its rise entirely out of the movement carried on by teachers on the island, who taught by virtue of the licence conferred by the chancellor of the cathedral. In the second decade of the 13th century, it is true, we find masters repairing to the left bank of the Seine and placing themselves under the jurisdiction of the abbot of the monastery of Ste. Geneviève; but it was around the bestowal of this licence by the chancellor of Notre Dame, on the Île de la Cité, that the university grew up. It is in this licence that the whole significance of the master of arts degree is contained; for what is technically known as admission to that degree was really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and commencement of, the functions of a duly licensed teacher and his recognition as such by his brethren in the profession. The previous stage of his academic career, that of bachelordom, had been one of apprenticeship for the mastership; and his emancipation from this state was symbolized by placing the magisterial cap (*biretta*) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former instructor. He gave a formal inaugural lecture, and was then welcomed into the society of his professional brethren with set speeches and took his seat in his master's chair.

Some time between the years 1150 and 1170 the University of Paris came formally into being. Its first written statutes were not, however, compiled until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliest recognition as a legal corporation belongs to about the year 1211, when a brief of Innocent III empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body. Papal recognition did not imply episcopal recognition, but with papal support Paris became the great transalpine centre of orthodox theological teaching. Successive pontiffs, down to the great schism of 1378, cultivated friendly relations with the university and systematically discouraged the formation of theological faculties at other centres. In 1231 Gregory IX, in the bull *Parens Scientiarum* (which has been called the Magna Carta of the university), gave full recognition to the right of the several faculties to regulate and modify the constitution of the university. The fully developed university was divided into four faculties: three "superior," those of theology, canon law and medicine; and one "inferior," that of arts, which was divided into four "nations." These nations, which included both professors and scholars, were: (1) the French, composed, in addition to the native element, of Spaniards, Italians and Greeks; (2) the Picard, representing the students from the northeast and the Netherlands; (3) the Norman; (4) the English, comprising, besides students from the provinces under English rule, those from England, Ireland, Scotland and Germany. The head of each faculty was the dean, of each nation the proctor. The rector, in the first instance, was head of the faculty of arts. Eventually he became the head of the collective university, by the incorporation under him, first, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, second, of the theologians, which took place about half a century later.

In the course of the 16th and 17th centuries this democratic constitution of the middle ages was largely superseded by the growth of a small oligarchy of officials. The tribunal of the university—the rector, deans and proctors—came to occupy a somewhat similar position to the old "Hebdomadal board" of heads of colleges at Oxford and the *caput* at Cambridge. Moreover, the teaching functions of the university, or rather of the faculty of arts, chiefly because of the absence of any endowment for the regents or teaching graduates, practically passed to the colleges. Almost as much as the English universities, Paris came to be virtually reduced to a federation of colleges, though the colleges were at Paris less independent of university authority, while the smaller colleges sent their members to receive instruction in the larger ones (*collèges de plein exercice*), which received large numbers of nonfoundation members. This state of things lasted till the French Revolution swept away the whole university system of the middle ages. It may be noted that the famous Sorbonne (*see* PARIS UNIVERSITY) was really the most celebrated college of Paris—founded by Robert de Sorbon in 1257—but as this college and the College of Navarre were the only college foundations which provided for students in theology, the close connection of the former with the faculty, and the use of its hall for the disputations of that body, led to the word Sorbonne becoming a popular term for the theological faculty of Paris.

In the 14th century the University of Paris had 40 colleges, governed either by secular or religious communities, and numbered among its students representatives of every country in Europe. The university became known as the great school where theology was studied in its most scientific spirit, and the decisions of its doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the middle ages were regarded as almost final. The popes, as already stated, discouraged the creation of faculties of theology elsewhere. The apparent exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy—Pisa (1343), Florence (1349), Bologna (1362) and Padua (1363)—were designed to benefit the Italian monasteries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at Toulouse (1229) took its rise under circumstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favoured the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived its most warmly contested powers and prerogatives.

ENGLISH MEDIAEVAL UNIVERSITIES

Oxford.—The University of Paris became the model for French universities north of the Loire and for those of central Europe and England. Of the universities modelled on that of Paris, Oxford would appear to have been the earliest. Certain schools, opened within the precincts of the dissolved nunnery of St. Frideswyde and of Oseney abbey, are supposed to have been the nucleus round which it grew up. In the year 1133 one Robert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is uncertain), arrived from Paris and delivered lectures on the Bible. Denifle maintains that there is, at best, only presumptive evidence of a *studium generale* at Oxford in the 12th century. Rashdall inclines to find the beginning in a migration of English students from Paris about 1167 or

1168. In the first-mentioned year we are told by John of Salisbury that "France, the mildest and most civil of nations," has "expelled her foreign scholars" (*Materials for the History of Thomas Becket*, ed. by Robertson, vi, pp. 235–236). At about the same time we hear of an edict of Henry II, during the quarrel with Becket, recalling all clerks holding benefices in England (as they loved their benefices) and forbidding all clerks in England to cross the channel (*ibid.*, i, pp. 53–54). Paris was at this time the great place of higher education for English students. Immediately after 1168 allusions to Oxford as a *studium* and a *studium generale* begin to multiply. The natural inference is that the breaking off of relations between England and Paris, in 1167 or 1168, led to the growth of a *studium generale* in Oxford, formed, no doubt, in the first instance of seceders from Paris. In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students. Hall, or places of licensed residence for students, also began to be established. In the year 1257, when the bishop of Lincoln, as diocesan, had trenched too closely on the liberties of the community, the deputies from Oxford, when preferring their appeal to the king at St. Albans, could venture to speak of the university as *schola secunda ecclesiae*, or second only to Paris. Its numbers about this time were probably about 3,000; but whenever plague or tumult led to a temporary dispersion, a serious diminution in its numerical strength generally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University college, founded in 1249 by William of Durham; Balliol college, founded about 1263 by John Balliol, the father of the king of Scotland of the same name; and Merton college, founded in 1264. The last-named is especially notable as associated with a new conception of university education; viz., that of collegiate discipline for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had previously been designed. The statutes given to the society by Walter de Merton are not less noteworthy, being characterized not only by breadth of conception but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges not only at Oxford but at Cambridge.

Cambridge.—The University of Cambridge, although it rose into existence somewhat later than Oxford, may reasonably be held to have had its origin in the same century. There was probably a certain amount of educational work carried on by the canons of the church of St. Giles, which gradually developed into the instruction belonging to a regular *studium*. In the year 1112 the canons crossed the river and took up their residence in the new priory in Barnwell, and their work of instruction acquired additional importance. In 1209 a body of students migrated there from Oxford. Then, as early as the year 1224, the Franciscans established themselves in the town and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the mendicants and other religious orders were admitted to degrees, a privilege which, until the year 1337, was extended to them at no other university. Their interest in and influence at these three centres were consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the University of Cambridge was already an organized body, with a chancellor at its head. In 1229 and 1231 the numbers were largely augmented by migrations from Paris and from Oxford. Cambridge, however, in its turn suffered from emigration; while in the year 1261, and again in 1381, the records of the university were wantonly burned by the townsmen. Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for. Although both Oxford and Cambridge were modelled on Paris, their higher faculties never developed the same distinct organization; and while the two proctors at Cambridge originally represented "north" and "south," the "nations" are scarcely to be discerned. An important step in the direction of discipline was, however, made in the year 1276, when an ordinance was passed requiring that everyone who claimed to be recognized as a scholar should have a fixed master within 15 days after his entry into the university. The traditional constitution of the English universities was, in its origin, an imitation of the Parisian, modified by the absence of the cathedral chancellor. But the feature which most served to give permanence and cohesion to the entire community at Cambridge was, as at Oxford, the institution of colleges. The earliest of these was Peterhouse, first founded as a separate institution by Hugh Balsham, bishop of Ely, in the year 1284. In 1324 was founded Michaelhouse, and two years later, in 1326, Edward II instituted his foundation of "king's scholars," afterward forming the community of King's hall. Both these societies, in the 16th century, were merged in Trinity college. To these succeeded Pembroke hall (1347) and Gonville hall (1348). All these colleges were expressly designed for the benefit of the secular clergy. The foundation of Trinity hall (*Aula*) in 1350 by Bishop William Bateman, on the other hand, as a school of civil and canon law was probably designed to further ultramontane interests. That of Corpus Christi (1352), the outcome of the liberality of a guild of Cambridge townsmen, was conceived with the combined object of providing a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the guild. But both Trinity hall and Corpus Christi college, as well as Clare hall, founded in 1359, were, to a great extent, indebted for their origin to the ravages caused among the clergy by the great plague of 1349.

FRENCH AND SPANISH MEDIAEVAL STUDIA

France.—Montpellier was a recognized school of medicine as early as the 12th century. Before the end of the century it possessed also a faculty of jurisprudence. The university of medicine and that of law continued, however, to be totally distinct bodies, with different constitutions. On Oct. 26, 1289, Montpellier was raised by Nicholas IV to the rank of a *studium generale*.

The University of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX on Count Raymund of Toulouse. In the year 1233 it first acquired its full privileges as a *studium generale* by virtue of a charter given by Gregory IX. The University of Orléans had a virtual existence as a *studium generale* as early as the first half of the 13th century, but in the year 1305 Clement V endowed it with new privileges and gave its teachers permission to form themselves into a corporation. The schools of the city had an existence long before—as early, it is said, as the 6th century. In the 14th century its fame as a school of law was surpassed by no other university in Europe. Before the 13th century it had been famed for its classical learning.

The other French universities famous in the middle ages were Angers, Avignon, Cahors (1331) and Grenoble (1339). At Perpignan and Orange there were schools of small note.

Spain.—Valladolid, which received its charter from Pope Clement VI in 1346, attained great celebrity. In 1418, at the Council of Constance, Martin V decreed that Valladolid should take rank not only as a *studium generale* but also as a *universitas theologiae*. From this time, accordingly, the advance of the university in numbers was steady and continuous throughout the 15th century, and, along with Salamanca, it served as the model for Alcalá in 1409.

Seville was founded in 1254 by Alphonso the Wise, simply for the study of Latin and of the Semitic languages, especially Arabic. Salamanca had been founded in 1243 by Ferdinand III of Castile as a *studium generale* in the three faculties of jurisprudence, the arts and medicine. But the main stress of its activity, as was the case with all the earlier Spanish universities, was laid on the civil and the canon law. In the early part of the

15th century, however, the efforts of Martin V established a school of theology which was afterward regarded almost as an oracle by Catholic Europe. About the year 1600 the students are shown by the matriculation books to have numbered more than 5,000. According to Cervantes they were noted for their lawlessness. The earliest of the numerous colleges founded at Salamanca was that of St. Bartholomew, long noted for its ancient library and valuable collection of manuscripts.

The only Portuguese university in mediaeval times was founded at Lisbon in 1290 and had its seat alternately there and in Coimbra, until, in the year 1537, it was permanently attached to Coimbra. It had received from King Dinis a charter, the provisions of which were mainly taken from those of the charter given to Salamanca. In 1772 the university was entirely reconstituted.

MEDIAEVAL UNIVERSITIES IN CENTRAL EUROPE

Prague.—Of the mediaeval universities in central Europe, Prague, which existed as a *studium* in the 13th century, was the earliest. It was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the emperor Charles IV, who was also king of Bohemia, and at whose request Pope Clement VI, on Jan. 26, 1347, promulgated a bull authorizing the foundation of a *studium generale* in all the faculties. In the following year Charles himself issued a charter for the foundation. Charles had been a student in Paris, and the organization of his new foundation was modelled on that university, a like division into four "nations" (although with different names) constituting one of the most marked features of imitation. The numerous students—and none of the mediaeval universities attracted in its earlier history a larger concourse—were drawn from a gradually widening area, which at length included not only all parts of Germany but also England, France, Lombardy, Hungary and Poland.

Cracow.—The University of Cracow, in Poland, was founded in May 1364 by virtue of a charter given by King Casimir III the Great, but its real commencement must be considered to belong to the year 1400, when it was reconstituted. Toward the close of the 15th century the university is said to have been in high repute as a school of both astronomical and humanistic studies.

Vienna.—The Avignonese popes appear to have regarded the establishment of new faculties of theology with special jealousy; and when, in 1364, Duke Rudolph IV founded the University of Vienna, with the design of constituting it a *studium generale* in all the faculties, Urban V refused his assent to the foundation of a theological school. Because of the sudden death of Duke Rudolph, the university languished for the next 20 years, but after the accession of Duke Albert III, who may be regarded as its real founder, it acquired additional privileges.

Heidelberg.—The University of Heidelberg (the oldest of those of the German realm) received its charter (Oct. 23, 1385) from Urban VI as a *studium generale* in all the recognized faculties save that of the civil law. It was granted at the request of the elector palatine, Rupert I. But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. In spite of the omission of the civil law in the original charter, this was included among its faculties almost from its first creation. No mediaeval university achieved a more rapid and permanent success.

Cologne.—As a result of the labours of the Dominicans, Cologne had gained a reputation as a seat of learning long before the founding of its university; and it was through the advocacy of some leading members of the mendicant orders that, at the desire of the city council, its charter as a *studium generale* (May 21, 1388) was obtained from Urban VI. It was organized on the model of the University of Paris, as a school of theology and canon law and "any other recognized faculty," the civil law being incorporated as a faculty soon after the promulgation of the charter. In common with the other early universities of Germany—Prague, Vienna and Heidelberg—Cologne owed nothing to imperial patronage, while it would appear to have been, from the first, the object of special favour with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in mediaeval times, and even far into the 16th century.

Erfurt.—Erfurt, no less noted as a centre of Franciscan than was Cologne of Dominican influence, received its charter (Sept. 16, 1379) from the antipope Clement VII, as a *studium generale* in all the faculties. Ten years later it was founded afresh by Urban VI. In the 15th century the number of its students was larger than that at any other German university—a fact attributable partly to the reputation it had acquired as a school of jurisprudence and partly to the ardour with which the nominalist and realist controversies of the time were debated in its midst; its readiness in according a hearing to novel theories caused it to be known as *novorum omnium portus*.

Leipzig.—The conditions connected with the rise of the University of Leipzig are especially noteworthy, it having been the result of the migration of almost the entire German element from the University of Prague. This element comprised: (1) Bavarians, (2) Saxons, (3) Poles (this last-named division being drawn from a wide area which included Meissen, Lusatia, Silesia and Prussia), and, being represented by three votes in the assemblies of the university, while the Bohemians possessed but one, had acquired a preponderance in the direction of affairs to which the latter could no longer submit. Religious differences, again, evoked mainly by the preaching of John Huss, further intensified the existing disagreements; and eventually, in the year 1409, King Wenceslaus, at the prayer of his Bohemian subjects, issued a decree which exactly reversed the previous distribution of votes —three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep umbrage and seceded to Leipzig, where, a bull having been obtained from Alexander V (Sept. 9, 1409), a new *studium generale* was founded by the landgrave of Thuringia and the margraves of Meissen. The members were divided into four nations composed of natives of Meissen, Saxony, Bavaria and Poland.

Rostock.—At Rostock, in the north, the dukes John and Albert of Mecklenburg conceived the design of founding a university from which the faculty of theology should be excluded. The university was accordingly founded as proposed in 1419, but in 1431 Eugenius IV instituted a faculty of theology. Six years later, the whole academic community having incurred the papal ban, was fain to migrate to Greifswald, returning, however, to Rostock in 1443, but with one important exception, that of a master of arts named Henry Rubenow, who remained to become burgomaster of the former city and succeeded in persuading Duke Wratislaw of Pommern to make it the seat of a university. Calixtus III granted a bull in 1456, but it was stipulated that the rector should be a bishop, and the professorial chairs were also made partially dependent for endowment on canonries. Greifswald thus became exposed to the full brunt of the struggle which had ensued when the endeavour to nationalize the German church was terminated by the Concordat of Vienna (1448).

Freiburg.—The universities of Freiburg, in Baden, and Tübingen, in Württemberg, alike owed their foundation to the countess Matilda, by whose persuasion her husband, the archduke of Austria, known as Albrecht VI, was induced to found Freiburg in 1455, and Count Eberhard (her son by a former marriage) to found Tübingen in 1477. At Freiburg, under the supervision of its first rector, Matthew Hummel of Villingen, the numbers were soon largely augmented by migrations of students from Vienna and from Heidelberg, while its resources, which originally were chiefly an annual grant from the city council, were increased by the bestowal of canonries and prebends. Erasmus made Freiburg his residence from 1529 to 1535, during which time he may have originated the tradition of liberal learning, but in 1620, under the rule of the archduke Maximilian, the control of the humanistic studies and of the entire faculty of philosophy was handed over to the Jesuits, who also gained possession of two of the chairs of theology.

Tübingen.—The University of Tübingen was founded in 1477 with the usual four faculties, and numbered Johann Reuchlin and Philipp Melanchthon among its teachers.

Louvain.—In the Netherlands the growing wealth and pros-

perity of the different states especially favoured the formation of new centres of learning. In the flourishing duchy of Brabant the University of Louvain (1426) was to a great extent controlled by the municipality; and its patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which it rewarded its professors. In the course of the next century the "Belgian Athens," as styled by Justus Lipsius, ranked second only to Paris in numbers and reputation. It possessed no fewer than 28 colleges, while its active press afforded facilities to the author and the controversialist of which both Cambridge and Oxford were at that time almost destitute. It embraced all the faculties, and no degrees in Europe stood so high as guarantees of general requirements. Erasmus recorded it as a common saying that "no one could graduate at Louvain without knowledge, manners and age."

Budapest.—In Hungary, Matthias I, Hunyadi, obtained permission in 1465 to found a university where he thought best in his realm. The university at Ofen (Hungarian *Buda*) was founded in 1475. It had a school of law at Pressburg, the sole remains of the university there founded by Matthias in 1465.

THE PASSING OF MEDIAEVALISM

France.—The earliest 15th-century university in France was that of Aix in Provence. It had originally been nothing more than a school of theology and law, but in 1409 it was reorganized as a *studium generale* on the model of Paris. Its students were divided into Burgundians, Provençals and Catalans.

The University of Poitiers was instituted by Charles VII in 1431 with the design of creating a centre of learning less favourable to English interests than Paris had at that time shown itself to be. He conferred on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers and Orléans, and at the same time placed the university under special royal protection.

The University of Caen was founded under English auspices during the short period of the supremacy of the English arms in Normandy in the 15th century. Its charter (May 1437) was given by Eugenius IV, and the bishop of Bayeux was appointed its chancellor. After the expulsion of the English from France, it received a new charter. From this time the University of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions; and, although swept away at the French Revolution, it was afterward restored, owing to the sense of the services it had thus once rendered to the national cause. Other French 15th-century foundations are Bordeaux (1441), Valence (1452), Nantes (1463) and Bourges (1465).

Central and Northern Europe.—The University of Basle was opened in 1460, under the auspices of its own citizens, and Pius II (Aeneas Sylvius) granted the charter (Nov. 12, 1459). During the first 70 years of its existence the university prospered, and its chairs were held by eminent professors, among them historical scholars such as Sebastian Brant and Jacob Wimpheling. But with the Reformation Basle became the arena of contests which menaced the very existence of the university itself, the professors being, for the most part, opposed to the new movement with which the burghers warmly sympathized. Eventually the statutes were revised, and in the latter half of the 16th century the university may be said to have attained its apogee.

The University of Ingolstadt was founded on April 7, 1459. But it was not until 1472 that the work of teaching was actually commenced there. Some long-existing prebends, founded by former dukes of Bavaria, were appropriated to the endowment. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter Reformation commenced. In 1556 the Jesuits made their first settlement in the university.

At Trier and Mainz universities were established in the second half of the 15th century. Trier received its charter as early as 1450, but the first academical session did not commence until 1473. Sixtus IV granted the charter to Mainz (Nov. 23, 1476) at the request of Archbishop Diether, who was himself a great humanist.

Other foundations were those of Uppsala (1477) and Copenhagen (1479), which, although lying outside the political boundaries of Germany, reflected its influence. The charter for Copenhagen was given by Sixtus IV as early as 1475.

The university founded at Wittenberg by Maximilian I (July 6, 1502) was the first established in Germany by imperial decree. Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls and is evidently not conceived in any spirit of antagonism to Rome. Wittenberg was constituted a *studium generale* in all the four faculties, the right to confer degrees in theology and canon law having been sanctioned by the papal legate several months before, on Feb. 2, 1502. Wittenberg was the first academic centre north of the Alps where the Latinity and antiquated methods of the scholastic era were overthrown.

Frankfurt-on-Oder received its charter in 1506.

Scotland.—The first Scottish foundation was at St. Andrews, founded in 1411 by Henry Wardlaw, bishop of that see, and modelled chiefly on the constitution of the University of Paris. It acquired all its three colleges—St. Salvator's, St. Leonard's and St. Mary's—before the Reformation. The most ancient of the universities of Scotland, with its three colleges, was thus reared in an atmosphere of mediaeval theology, and undoubtedly designed as a bulwark against heresy and schism. But "by a strange irony of fate, two of these colleges became, almost from the first, the foremost agents in working the overthrow of that Church which they were founded to defend." St. Leonard's more especially became a noted centre of intellectual life and Reformation principles.

The University of Glasgow was founded as a *studium generale* in 1453. Among its objects also was "the extension of the Catholic faith"; but it was to produce John Knox. It was founded on the model of Bologna, but in its customs largely imitated Louvain, whose rector at the time was a Scotsman. Though founded to "flourish in theology, canon and civil law, and in any other lawful Faculty," for long only the faculty of arts had a constitution. Throughout the 15th century this faculty flourished exceedingly.

The University of Aberdeen was founded in 1494, mainly through the efforts of Bishop William Elphinstone, who had earlier been successively dean of the faculty of arts and rector of Glasgow university. He avoided two defects in the constitutions of St. Andrews and Glasgow by providing salaries for teachers in the higher faculties and establishing a visitorial power.

The fourth Scottish university, Edinburgh, was a post-Reformation foundation.

General Aspects.—Generally speaking, the mediaeval universities were conservative. Alexander Hegius, Johan Wessel and Rodolphus Agricola carried on their work as reformers at places like Deventer, remote from university influences. That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that unprofitable kind which, while giving rise to endless controversy, turned upon questions in connection with which the implied postulates and the terminology employed rendered all scientific investigation hopeless. At almost every university—Leipzig, Greifswald and Prague (after 1409) being the principal exceptions—the so-called Realists and Nominalists represented two great parties occupied with an internecine struggle. At Paris, because of the overwhelming strength of the theologians, the Nominalists were, indeed, under a kind of ban; but at Heidelberg they had altogether expelled their antagonists. It was much the same at Vienna and at Erfurt. At Basle, under the leadership of the eminent Johannes a Lapide, the Realists with difficulty maintained their ground. Freiburg, Tübingen and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor and representing a distinct "nation." At Mainz the authorities adopted a manual of logic which was essentially an embodiment of nominalistic principles.

In Italian universities, it was decided that these controversies were endless and that their effects were pernicious. It was resolved, accordingly, to expel logic and allow its place to be filled by rhetoric, thereby effecting that important revolution in aca-

demic studies which constituted a new era in university learning and largely helped to pave the way for the Reformation. Hence the Italian universities enjoyed a fortunate immunity from dissensions such as those which distracted the centres of learning in Germany.

The professorial body in the great Italian universities attained an almost unrivalled reputation throughout Europe. For each subject of importance there were always two, and sometimes three, rival chairs, and a powerful and continuous emulation was thus maintained among the teachers. "The call to a Paduan or Pisan chair was deemed the highest of all literary honours. The status of professor was, in Italy, elevated to a dignity which in other countries it has never reached; and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land. While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and country were, in them, no bar—the latter not even a reason of preference. Foreigners of every nation are to be found among their professors; and the most learned man in Scotland, Thomas Dempster, sought in a Pisan chair that theatre for his abilities which he could not find at home."

Spain.—To such catholicity of sentiment the Spanish universities of this period offer a complete contrast, their history being strongly modified by political and religious movements. Valencia, founded in 1501, and Seville, sanctioned by Julius II in 1505, appear both to have been regarded without mistrust at Rome. Julius had approved the foundation of the University of Santiago as early as 1504, but the bull for its creation was not granted by Clement VII until 1526. The design of establishing a university at Granada was deferred until 1531. Little, indeed, is to be learned respecting the new society until the foundation of the liberally endowed College de Sacro Monte by the archbishop of the province in 1605. Under the direction of the Jesuits, the scholastic philosophy, together with a certain attention to Greek and Hebrew, became the dominant study. Gregory XIII in 1574 authorized the foundation of the University of Oviedo; but this was not opened until 1608, and then only with a faculty of law. After this time the universities in Spain shared in the general decline of the country; and, even after the expulsion of the Jesuits in 1769, no marked improvement is discernible in their schools until the second half of the 19th century.

Mention should be made, however, of the foundations in Spanish America, which went on for more than two centuries. They included the University of Lima, Peru (now Universidad Nacional Mayor de San Marcos and claimed as the oldest university in the new world), set up as a Dominican seminary in 1551 and secularized in 1571 with faculties in philosophy and theology; Mexico City, opened in 1553, Bogotá, Colom. (1572); Cuzco, Peru (1696); Havana, Cuba (1728); and Santiago, Chile (1747).

THE REFORMATION

The Reformation represents the first great boundary line in the history of European universities. Even in Roman Catholic countries its effects found expression in connection with the Counter Reformation. The influence of the humanists, and the special character which the Reformation assumed in Germany through the labours of scholars like Erasmus, Reuchlin and Melanchthon, augured well for the future. German university teaching was free from the frivolity, pedantry and scepticism which characterized so much of the corresponding culture in Italy. It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the Fathers. The bigoted and ceaseless controversies evoked by the promulgation of Lutheran or Calvinistic doctrine dispelled, however, this prospect, and converted the universities into gloomy fortresses of sectarianism. For a century after the Reformation the history of Lutheran theology became almost identified with that of the German universities.

Marburg.—The first Protestant university was that of Marburg, founded by Philip the Magnanimous, landgrave of Hesse, May 30, 1527, and mainly built up out of the confiscation of the property of the religious orders in the Hessian capital. It rapidly became famous and attracted students from remote countries. After 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined. This dictation by the temporal power now becomes one of the most notable features in academic history in Protestant Germany.

Königsberg.—The Lutheran University of Königsberg was founded Aug. 17, 1544, by Albert III, margrave of Brandenburg and the first duke of Prussia, and his wife Dorothea, a Danish princess. King Sigismund of Poland gave the charter (Sept. 29, 1561), and students who graduated as masters in the faculty of philosophy ranked as nobles of the Polish kingdom. When Prussia was raised to the rank of a kingdom (1701) the university was made a royal foundation, and the *collegium Fridericianum*, which was then erected, received corresponding privileges. Königsberg will always be remembered as the university of Kant.

Jena.—The Lutheran University of Jena was opened on Feb. 2, 1558. Distinguished for its vehement assertion of Lutheran doctrine, its hostility to the teaching of Wittenberg was hardly less pronounced than that with which both centres regarded Roman Catholicism. For a long time it was chiefly noted as a school of medicine, and in the 17th and 18th centuries was in bad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent.

Helmstedt.—The Lutheran University of Helmstedt, founded by Duke Julius (of the house of Brunswick-Wolfenbüttel), received its charter May 8, 1575, from the emperor Maximilian II. It was munificently endowed by the founder and by his son, and its *Convictorium*, or college for poor students, expended in the course of 30 years no less than 100,000 thalers, an extraordinary expenditure for an institution of such a character in those days. Distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes. Until suppressed in 1809, Helmstedt enjoyed the special and powerful patronage of the dukes of Saxony.

Altdorf.—The *Gymnasium Aegidianum* of Nuremberg, founded in 1526 and moved in 1575 to Altdorf, represents the origin of the University of Altdorf. Altdorf was about the poorest university in Germany, yet long one of the most eminent. Its whole endowment never rose above £800 a year.

17TH- AND 18TH-CENTURY GERMAN FOUNDATIONS

Giessen.—The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the universities of Giessen and of Rinteln. Giessen, founded by the margrave of Hesse-Darmstadt, Louis V, as a kind of refuge for the Lutheran professors from Marburg, received its charter from the emperor Rudolph II (May 19, 1607). In 1625 the university was transferred to Marburg; in 1650 it was moved back again to Giessen.

Strasbourg.—The University of Strasbourg was founded in 1621 on the basis of an already existing academy which, under the direction of John Sturm, had attracted students from all parts of Europe and especially from Portugal, Poland, Denmark, France and England. The method of Sturm's teaching became the basis of that of the Jesuits, and, through them, of the public schools in England. In 1621 Ferdinand II conferred on this academy full privileges as a university. In 1681 Strasbourg became French. It was refounded by the emperor William I and before the close of the century numbered more than 1,100 students. At the end of the 18th century, after its reversion to Germany, it was distinguished by an intellectual activity with which the name of Goethe is connected.

Kiel.—The royal university of Kiel was founded in 1665 by Duke Christian Albrecht of Holstein (who himself assumed the office of rector), with faculties of theology, law, medicine and philosophy. After the incorporation of Schleswig-Holstein with

the kingdom of Prussia it made a marked advance.

Halle and Pietism.—The year 1693 saw the foundation of the University of Halle, which has been described as the "first real modern university." It originated in a *Ritterschule* for the sons of the nobility. Leopold I granted (Oct. 19, 1693) the requisite charter. The primary object in founding a university in Halle was to create a centre for the Lutheran party; but its character, under the influence of its two most notable teachers, Christian Thomasius and A. H. Francke, soon expanded beyond the limits of this conception. Thomasius and Francke had both been driven from Leipzig because of their liberal and progressive tendencies. Thomasius was the first to set the example, soon after followed by all the universities of Germany, of lecturing in the vernacular instead of in the customary Latin. Francke, as the founder of that Pietistic school, exercised great influence. Christian Wolff, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pietists. In 1740, however, he was recalled by Frederick II and reinstated. Throughout the whole of the 18th century Halle was the leader of academic thought and advanced theology in Protestant Germany, although sharing that leadership, after the middle of the century, with Göttingen.

Göttingen.—The University of Göttingen (named after its founder, "Georgia Augusta"), was endowed with the amplest privileges as a university by George II of England, elector of Hanover, Dec. 7, 1736. The university included all the faculties, and two of its first professors—J. L. von Mosheim, the eminent theologian from Helmstedt, and G. L. Böhmer, the no less distinguished jurist from Halle—together with Johann Gesner, the man of letters, at once established its reputation. Not least among its attractions was also its splendid library, located in an ancient monastery. The Göttingen school of history became famous. The labours of the professors at Göttingen, especially J. S. Pütter, J. C. Gatterer, A. L. von Schlözer and L. T. von Spittler, combined with those of J. J. Mascov at Leipzig, did much to promote both a more catholic treatment and a wider scope. The method of appointment of professors was reformed by the chief curator, G. A. von Münchhausen, on lines similar to those already instituted in the universities of the Netherlands by Janus Dousa.

Erlangen.—The University of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Bayreuth. Its charter was granted by the emperor Charles VII in 1743. In 1791, Ansbach and Bayreuth having passed into the possession of Prussia, Erlangen also became subject to the Prussian government.

NORTHERN EUROPE

The earliest Dutch university, Leyden, founded in 1575, commemorated the successful resistance of the citizens to the Spanish. Throughout the 17th century Leyden was distinguished by its learning, the ability of its professors and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Much of its early success was a result of the wise provisions and the influence of the celebrated Janus Dousa. Dousa, in fact, did for Leyden and the Dutch what Münchhausen afterward did for Göttingen and the German universities. The appointment of the professors at Leyden was vested in three (afterward five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province, the office being held for nine years and eventually for life. With these was associated the mayor of Leyden for the time being. Leyden secured and maintained a very high reputation for scientific work. Other Dutch universities with a famous history are Franeker (1585), Harderwyk (1600), Groningen (1614) and Utrecht (1634), the last being a great resort in the 18th century for English students.

The Royal University of Uppsala, whose foundation as a *studium generale* was sanctioned by Pope Sixtus IV in 1477, despite a checkered history remained the chief centre of higher education in Sweden. In the 18th century lectures began to be delivered in Swedish, but the mediaeval division of the students into "nations" continued, as at Lund (1666), until the second quarter of the 19th.

REFORMATION AND POST-REFORMATION IN BRITAIN

Oxford and Cambridge.—The influence of the Renaissance and the teaching of Erasmus, who resided at both universities, exercised a notable effect alike at Oxford and Cambridge. The names of John Colet, William Grocyn and Thomas Linacre illustrate this influence at the former centre; those of Bishop John Fisher, Sir John Cheke and Sir Thomas Smith at the latter. The labours of Erasmus at Cambridge, as the author of a new Latin version of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine several years before the writings of Luther became known in England. The foundation of Christ's college (1505) and St. John's college (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity college, Cambridge, in 1547 (partly by an amalgamation of two older societies), represents the earliest conception of such an institution in England in complete independence of Roman Catholic traditions. Trinity (1554) and St. John's (1555) at Oxford, on the other hand, founded during the reactionary reign of Mary, serve rather as examples of a transitional period.

Puritanism at Cambridge.—In the reign of Elizabeth, Cambridge became the centre of another great movement, that of the earlier Puritanism, St. John's and Queens' being the strongholds of the party led by Thomas Cartwright, Walter Travers and others. The movement continued to gather strength, and Emmanuel college, founded in 1584, owed much of its early prosperity to the fact that it was a known school of Puritan doctrine. Most of the Puritans objected to the discipline enforced by the university and ordinary college statutes, especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as archbishops John Whitgift and Richard Bancroft, resorted in defense to a repressive policy, of which subscription to the Acts of Supremacy and Uniformity and the Elizabethan statutes of 1570 (investing the *caput* with larger powers and thereby creating a more oligarchical form of government) were the most notable results. Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636. It was under these respective codes—the Elizabethan statutes of 1570 and the Laudian statutes of 1636—that the two universities were governed until the introduction of new codes in 1858. The fidelity with which both universities adhered to the royal cause in the Civil War caused them to be regarded with suspicion by the Puritan party, and under the Commonwealth both Oxford and Cambridge were, for a brief period, in great danger because of the distrust, which reached its highest point among the members of the "nominated parliament" (July-December 1653), of university education generally, as tending to foster contentiousness with respect to religious belief. It was even proposed by William Dell—himself the master of Caius college—to abolish the two universities altogether, as hopelessly pledged to antiquated and obsolete methods, and to establish in their place schools for higher instruction throughout the country. They were saved, however, by the firmness of Cromwell, at that time chancellor of Oxford, and, although Aristotle and the scholastic philosophy no longer held their ground, a marked improvement was observable both in discipline and morality among the students. At Oxford, under the influence and teaching of John Wilkins, Seth Ward and John Wallis, a flourishing school of mathematics was formed.

The Cambridge Platonist Movement.—In the 17th century Cambridge became the centre of a further movement (a reflex of the influence of the Cartesian philosophy), which attracted for a time considerable attention. Its leaders, known as the Cambridge Platonists, among whom Henry More and Ralph Cudworth were

especially conspicuous, were men of high character and great learning, although much under the influence of an ill-restrained enthusiasm and purely speculative doctrines. The spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whom were Isaac Barrow, master of Trinity (1673–77), the two Lucasian professors Isaac Newton (professor 1669–1702) and his successor William Whiston (professor 1702–11), and Roger Cotes (Plumian professor 1707–16), began to render the exact sciences more and more an object of study, and the institution of the tripos examinations in the course of the first half of the 18th century established the reputation of Cambridge as a school of mathematical science. At Oxford, where the study had, in turn, declined, and where the statutable requirements with respect to lectures and exercises were suffered to fall into neglect, academic culture declined.

Edinburgh.—The "College of Edinburgh" was founded by charter of James VI, dated April 14, 1582. This made no mention of a *studium generale* or of any of the privileges associated with a university, and not until 1685 was the college referred to as a university in municipal records. But the charter gave the town council the right to provide for the teaching of all the subjects usual in a university, and from 1587 the college conferred degrees.

Trinity College, Dublin.—Trinity college, Dublin, was founded in 1591. A royal charter nominated a provost and a minimum number of three fellows and three scholars as a body corporate. The first five provosts of Trinity college were all Cambridge men, and under the influence of Archbishop Adam Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias, but the policy of Laud and Wentworth was to make the college more distinctly Anglican as regards its tone and belief. At the Restoration its condition was found to be that of a well-ordered home of learning and piety, with its estates well secured and its privileges unimpaired. Under Bishop Jeremy Taylor, who succeeded to the vice-chancellorship, its progress in learning was considerable.

THE COUNTER REFORMATION

Bamberg.—The earliest university whose charter represented the Counter Reformation was that of Bamberg, founded by the prince-bishop and opened Sept. 1, 1648. At first, however, it comprised only the faculties of arts and of theology; to these were added in 1729 that of jurisprudence and in 1764 that of medicine. The university library was enriched by a collection of manuscripts from about 30 suppressed monasteries, convents and religious institutions at the time of the "secularization."

Innsbruck.—The University of Innsbruck was founded in 1672 by the emperor Leopold I. In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745. In 1782 the university was reduced by the emperor Joseph II from the status of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees. In 1791 it was restored to its privileges by the emperor Leopold II.

Breslau.—The University of Breslau was founded by the emperor Leopold I in 1702. When Frederick the Great conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when, in 1774, the order was suppressed by Clement XIV he established them as priests in the Royal Scholastic institute, at the same time giving new statutes to the university.

Jesuit Influence in France.—In no country was the influence of the Jesuits on the universities more marked than in France. The civil wars in that country during the 30 years which preceded the close of the 16th century told with disastrous effects upon the condition of the University of Paris, and with the commencement of the 17th century its collegiate life seemed at an end and its 40 colleges stood absolutely deserted. To this state of affairs the obstinate conservatism of the academic authorities contributed not a little. The Jesuits did not fail to profit by this excessive conservatism on the part of the university, and during the second half of the 16th century and the whole of the 17th they contrived to gain almost a complete monopoly of both the higher and the lower education of provincial France. Their schools rose at Toulouse and Bordeaux, at Auch, Agen, Rhodez, Périgueux, Limoges, Le Puy, Aubenas, Béziers, Tournon, in the colleges of Flanders and Lorraine, Douai and Pont-à-Mousson—places beyond the jurisdiction of the *parlement* of Paris or even of the crown of France. Their banishment from Paris itself had been by the decree of the *parlement* alone and had never been confirmed by the crown. "Lyons," says Mark Pattison, "loudly demanded a Jesuit college," and even the Huguenot duke of Lesdiguières, almost king in Dauphiné, was prepared to erect one at Grenoble. The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Edmond Richer in 1598 and by the discerning protection extended by Henry IV.

Nevertheless, the University of Paris remained distracted throughout the 17th century by theological dissensions—in the first instance as a result of the struggle that ensued after the Jesuits had effected a footing at the Collège de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Toward the close of the century a certain revival took place, and a succession of illustrious names—E. Pourchot, Charles Rollin, Bénigne Grenan, Charles Coffin, Jean-Gabriel Demontempuis, J. B. L. Crevier, Charles Le Beau—appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation of the bull *Unigenitus* in 1713, condemning the tenets of Pasquier Quesnel. At last, in 1762, the *parlement* of Paris issued a decree (Aug. 6) placing the colleges of the Jesuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris, the university being installed in possession of its vacated premises. Concurrently with this measure, both history and natural science began to be cultivated with a certain success. Then came the French Revolution.

19TH AND EARLY 20TH CENTURIES

The United Kingdom.—The Reformation marked the first great turning point in the history of the universities; the 19th century can lay good claim to having marked the second. It saw the foundation of numerous new universities, many in parts of the world previously unprovided with facilities for higher education; it saw also the reconstitution of numerous ancient universities. Neither process was the result of chance; new and reconstituted universities alike arose to meet new needs, the needs of an expanding world and an increasingly industrialized age.

Oxford and Cambridge.—In the United Kingdom of Great Britain and Ireland both processes took place. At the beginning of the 19th century Oxford and Cambridge were "the endowed preserve of a class" (Sir Charles Grant Robertson, *The British Universities*); by the end of it the "privileges and monopoly" of this class had been almost completely swept away. Much of the reform came from within, but two royal commissions, in 1858 and 1877, investigated the affairs of the universities and recommended drastic and far-reaching changes. During the century the range of studies was enormously extended. Exacting written examinations took the place of the often merely formal oral ceremonies. The professoriate was increased, reorganized and re-endowed, so that it became a resident university body.

General and uniform regulations were enforced for the selection, duties and salaries of professors, lecturers and examiners. Fellowships were thrown open to merit. The colleges were emancipated from their mediaeval statutes, invested with new constitutions and granted new legislative powers, while at the same time a proportion of their revenues was diverted to the uses of the university. A great mass of vexatious and obsolete oaths was swept away; in 1858 dissenters were admitted to matriculation and the B.A., and in 1871 all religious tests were abolished.

In 1863 noncollegiate students were admitted to Oxford and in 1869 to Cambridge. Women's colleges were also established, Girton (1869) and Newnham (1871–75) at Cambridge, Somerville (1879) and Lady Margaret Hall (1878), the latter being followed by St. Hugh's (1886) and St. Hilda's (1893) at Oxford.

Women had to wait, however, until the 20th century before the ancient English universities would admit them to degrees.

London.—London, the first of Britain's modern universities, was born out of religious differences, which gave it a unique and unhappy start. It originated in a movement begun in 1825 by the poet Thomas Campbell, Henry (later Lord) Brougham and influential dissenters, whose aim was to set up an institution of university status for students excluded from Oxford and Cambridge by religious belief or lack of means. In 1828 the University of London was opened. But the project brought into being a rival group, equally influential, which in 1829 opened King's college, London, whose curriculum was similar except that it included instruction in "the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland." The result was that neither college received a university charter. In 1836 a nonteaching body, called London university, was created, authorized to hold examinations and confer degrees, not only, it is important to note, upon students of its two incorporated colleges, University and King's, but also upon students of such other institutions in the United Kingdom and the British colonies as it might affiliate.

In 1858 the degrees of London university (except in medicine) were made available to all. Since that date London has awarded two kinds of degrees, *internal* to members of the university and *external* to anyone else passing its examinations, whether members of an educational institution or private students. This extraordinary constitution caused the University of London embarrassment for many years but later the external degrees were to prove of inestimable value in assisting university colleges in England and throughout the British Commonwealth to qualify for full university status. The colleges prepare their students for the London degrees until such time as their academic standards, their teaching staff and their financial resources are sufficiently good to justify application for a university charter.

Attempt after attempt was made to reorganize the university until in 1900 it was reconstituted so that only institutions within the county of London could become recognized as "schools of the university."

Durham and Newcastle.—The London colleges were designed for students of limited means. So was the University of Durham. A residential, collegiate university, modelled on Oxford, it was founded by act of parliament in 1832 and received its charter in 1837. It was endowed from the revenues of Durham cathedral and diocese. With it was associated in 1852, and more closely in 1870, the Newcastle College of Medicine.

In 1871 the Durham College of Physical Science was founded (in Newcastle; later called Armstrong college) and incorporated into the university. In 1908 the university was reconstituted in two divisions—Durham and Newcastle—under a single vice-chancellor but with separate teaching staffs. A further reconstitution in 1937 established a central financial control and merged the two Newcastle colleges into King's college, Newcastle upon Tyne.

Other Provincial Universities.—Forty-four years were to elapse before another English university was founded, but within that period the progenitors of at least three others were born, and before the end of the century an additional five. In 1851 Owens college, Manchester, was established to teach "such branches of learning and science as were then or might hereafter be usually taught in English universities."

In 1874, at Leeds, arose the Yorkshire College of Science; in 1876 the University college, Bristol; both absorbed earlier medical schools. Within the next 20 years there were similar colleges at Birmingham, Liverpool, Nottingham, Reading and Sheffield. In 1880 Owens college became the Victoria University of Manchester, in which were shortly federated the university colleges of Leeds and Liverpool.

"Redbrick" Universities.—The university college movement produced a rich harvest in the first decade of the 20th century. Mason college became Birmingham university in 1900. Liverpool and Leeds broke away from Manchester to obtain their own charters in 1903 and 1904, respectively. The University of Sheffield followed in 1905 and that of Bristol in 1909. These five, with Manchester, established a new tradition in English university education. Each was the product of a large industrial city, endowed by its citizens (who justly claimed a share in its government) and linked closely with its occupations. Each had a strong scientific and technological side. Each catered mainly though never exclusively, for local students and was consequently nonresidential. All were completely free of religious tests; in some the teaching of religion was forbidden. In all the fees and other expenses were low. The sobriquet "Redbrick" given them later by an English writer referred primarily to their buildings but also characterized them as a homogeneous group.

Scotland.—In the 19th century three royal commissions wrestled with the affairs of the Scottish universities. The first, which reported in 1830, produced no tangible results, the opposition to its proposals proving too strong. But it stimulated thought about reform and paved the way for the commission of 1858, whose recommendations, embodied in the Universities (Scotland) act, 1858, remodelled the Scottish universities and assimilated their constitutions and conditions of graduation. The teaching and administrative functions were differentiated by the setting up at each university of a university court whose duty was to review all decisions taken by the *Senatus Academicus*. In addition, each university was given a general council, which was to meet twice yearly to consider "all questions affecting the well-being and prosperity of the university." The two independent degree-conferring colleges at Aberdeen, King's and Marischal, were amalgamated.

The Universities (Scotland) act, 1889, introduced further drastic changes. It set up a Scottish universities committee of the privy council, to which all ordinances and petitions from the universities had to be referred. (This procedure was abandoned 20 years later because of the delays and difficulties it caused.) It increased the membership and powers of the university courts, adding to them representatives of the senate, the general council and the municipality within which the university was situated, and vesting in them responsibility for the business management of the university property and finances, leaving the control of education and discipline only to the *senatus*. It gave statutory recognition to the Students' Representative council (which had come into being in 1884) and empowered it to petition the *senatus* or the university court about any matter affecting the students' interests. It reorganized the curriculums of all the faculties except divinity, greatly broadening them and ending the compulsion to take the "sacred six" subjects in arts (Latin, Greek, mathematics, natural philosophy, logic and moral philosophy). It reduced the period of required residence from four to three years, established a new system of honours degrees and empowered the courts to admit women to lectures and degrees in all faculties. Most of these changes were effected by the executive commission set up under the act; they took eight years to complete.

Wales.—The principality of Wales played a notable part in the university college movement and because of a strong national feeling and an earlier development of secondary education than in England, secured its university in 1893, when the university colleges of Aberystwyth (1872), Cardiff (1883) and Bangor (1885) were federated. St. David's college, Lampeter (1827), a theological college, was not included, but retained its right to confer the degrees of bachelor of arts and of divinity.

Ireland.—Religious difficulties gravely impeded university education. In 1845 three state-endowed university colleges were set up by act of parliament at Belfast, Cork and Galway, and in 1850 they were federated as the Queen's university. As no provision was made for theological teaching they were boycotted by Roman Catholics. In 1850 John Henry (later Cardinal) Newman founded a Roman Catholic university at Dublin, but this was refused the right to grant degrees. In 1879 the Queen's university was displaced by the Royal university, a nonteaching body empowered to hold examinations and grant degrees, which Roman Catholics could take.

In 1909 university education in Ireland was reorganized. Two new universities were created: the National University of Ireland at Dublin, which incorporated the Queen's colleges at Cork and

Galway and set up a third college in Dublin; and the Queen's university at Belfast (formerly the Queen's college). Both universities were given nominated senates, with a Roman Catholic majority in Dublin and a Protestant one in Belfast. Trinity college, Dublin, was left intact. In all three universities there were to be no religious tests for teachers or students.

COMMONWEALTH OF NATIONS

India.—Though there were previously institutions of university status, the foundation of universities as such in India was the outcome of the parliamentary inquiry which preceded the confirmation of the East India company's charter in 1853, and of Sir Charles Wood's dispatch to its court of directors in 1854. In 1857 three universities—Calcutta (Jan. 24), Bombay (July 18) and Madras (Sept. 5)—were founded on the London model as examining bodies with power to affiliate. The framers of this policy did not intend the universities to have no teaching functions, but not until the 20th century did they become fully teaching institutions. Proposals made in 1865–67 for an oriental university in the Punjab resulted in the foundation of a university college at Lahore which became a university in 1882, and in 1887 Allahabad university followed. Both of these were London-model examining and affiliating bodies, though the University of the Punjab was also authorized to appoint teachers.

In 1902 a universities' commission recommended, and in 1904 an act provided, that the older universities should become teaching bodies. The conditions for affiliation were stiffened. In 1913 a government resolution proposed the establishment of residential universities at Dacca, Aligarh and Benares and the creation of new universities at Rangoon, Patna and Nagpur; but the outbreak of World War I delayed these developments.

Canada.—The history of the universities of Canada is highly complex, reflecting the varied religious and political influences in the making of the nation. All the older universities except two were founded by religious bodies, among whom the Roman Catholics, Anglicans, Presbyterians, Methodists and Baptists were prominent. Broadly speaking, these copied three models, Paris, Oxford and Edinburgh, according to the nationality of the founders. Later, after efforts, largely unsuccessful, to overcome the denominational problem by founding universities on the London style, there came the evolution of a distinctively Canadian type of federated university. Finally, the 20th century saw, in the western provinces, the foundation of fully state-provided universities.

The French Laval university, Quebec, was founded as late as 1852, but the Seminary of Quebec, from which it sprang, dates from 1633. The University of Montreal was founded in 1878 as a branch of Laval, from which it was finally separated in 1920. Other Roman Catholic foundations were Ottawa (1849) and St. Francis Xavier, Antigonish, N.S. (1853), the latter with no religious tests for entrance or degrees. Three colleges, each called King's college and each a Church of England establishment, were early founded by the immigrant American loyalists and received royal charters: at Windsor, N.S. (1802; later moved to Halifax), Toronto (1827)—later the University of Toronto—and Fredericton, N.B. (1828), which in 1859 was secularized as the University of New Brunswick. All three were modelled upon Oxford. Later Anglican foundations included the University of Bishop's College, Lennoxville, Que. (1853), and Western university (1878); the latter became nondenominational in 1908 and later changed its name to Western Ontario. The Baptists founded Acadia, Wolfville, N.S. (1838), and in 1887 amalgamated two colleges to form McMaster, now located in Hamilton, Ont. The Presbyterians founded Queen's, Kingston, Ont. (1841), modelling it on Edinburgh; it became nondenominational in 1912. The Methodists founded Mount Allison academy at Sackville, N.S., which was given a university charter in 1858 and later also became nondenominational.

The two private foundations, Dalhousie (Halifax, N.S.) and McGill (Montreal, Que.), were both from the start nonsectarian. Both were Scottish-type universities. Each had a precarious early existence; Dalhousie, though founded in 1818, did not open until 1838, and was closed again between 1843 and 1863. The reopening was made possible by the closing of various Presbyterian and Congregational colleges. In 1868 the government withdrew grants from denominational colleges, and this, with the increasing cost of maintenance, compelled them to think seriously about federation. In 1887 a scheme was approved for a university of Toronto consisting essentially of "a group of arts or divinity colleges gathered about a central university, supported and controlled by the State, the University conducting examinations, conferring degrees (except in Divinity), and giving the instruction in those branches of learning which are costly to conduct, or are taken by only a few students, or are professional in character." (*Yearbook of the Universities of the Commonwealth, 1949–50*, p. 547). This scheme became archetypal.

For nearly 20 years Toronto university was administered by a government department. In 1906 it was granted an independent board of governors, nominated by the lieutenant governor in council, and the right of nominating to academic appointments was vested in the president of the university. In 1907 Manitoba university was reconstituted on the same lines. In 1906 and 1907 provincial universities, modelled on Toronto, were founded in Alberta at Edmonton and in Saskatchewan at Saskatoon.

Australia.—The earliest Australian universities successfully combined mediaeval and modern features. Each was established by the state legislature, yet constituted a self-governing corporation. Each relied for support upon both public money and private benefactions. Each was nonresidential, nondenominational and secular, yet each made provision for including residential denominational colleges on religious foundations. Geography dictated their location in capital cities. The first to be founded was Sydney (1850), closely followed by Melbourne (1853). Each of these had, before the end of the 19th century, three colleges for men and residential accommodation for women. Adelaide was similarly established in 1874 but did not incorporate any colleges until the 20th century. When the University of Queensland was founded in 1909 it was made wholly residential, and four colleges, including one for women, were established within four years. Living at home was recognized as residence. The universities of Tasmania, Hobart (founded 1890, charter 1915), and Western Australia, Perth (1911), had no such provision.

New Zealand.—In 1869 the University of Otago, Dunedin, was founded by provincial ordinance, with power to grant degrees in arts, law and medicine. But the next year the University of New Zealand, Wellington, a purely examining body, was established, and in 1874 Otago agreed to affiliate with it and to hold in abeyance its own right to grant degrees. Canterbury University college, Christchurch (founded 1873), also affiliated, as did later Auckland (1882) and Victoria (1897). In the early days New Zealand maintained academic standards by appointing external examiners from England.

Union of South Africa.—The development of university education in South Africa aptly illustrates the truth that universities are born to meet new needs. Higher education began with the founding in 1829 of South African college, Capetown, a proprietary institution which for 20 years had no competitors. Then within six years appeared the Diocesan college, Capetown (1849), St. Andrew's, Grahamstown (1855), and Grey college, Bloemfontein (1855). In 1858 there was established, primarily to examine candidates for public appointments, a board of examiners in literature and science, which shortly began to conduct examinations not unlike those for university degrees. This greatly stimulated the work of the colleges, and by a natural sequence the University of the Cape of Good Hope, an examining and degree-granting body, took the place of the board in 1873. Almost simultaneously the Cape parliament passed a higher education act providing for salary grants to professors at recognized colleges. This further stimulated progress and incited other college foundations, including Stellenbosch (1874), which was raised to university status in 1916. Later came the Kimberley School of Mines (1896), Pretoria University college (1908) and Natal University college (1909), all destined eventually to graduate into universities.

CONTINENTAL EUROPE

France.—On Sept. 15, 1793, the universities and colleges throughout France, together with the faculties of theology, medicine, jurisprudence and arts, had been abolished by a decree of the convention, and the whole system of national education may be said to have remained in abeyance until 1808, when Napoleon I promulgated the scheme which in many essential features obtains today. The whole system of education, primary, secondary and higher, was made subject to the control and direction of the state. France was divided into 17 districts, designated "academies," each administered by its own rector and council, but subject to the supreme authority of the minister of public instruction, and representing certain faculties which varied at different centres, in conformity with the new scheme of distribution for the entire country. The "University of France," as it was styled, became little more than an abstract term signifying collectively the various centres of professional education in their new relations to the state. While three new "academies"—those of Lille, Lyons and Rennes—were formed in 1808, many of the pre-existing centres were completely suppressed. In some cases, however, the effacement of an ancient institution was avoided by investing it with new importance, as at Grenoble; in others, the vacated premises were appropriated to new uses connected with the department, as at Avignon, Cahors and Perpignan. Each rector of an "academy" was also constituted president of a local *conseil d'enseignement*, in conjunction with which he nominated the teachers in elementary and secondary schools. The appointments were ratified by a promotion committee in Paris.

"Free Faculties."—In 1895 the government was prevailed upon to sanction the institution of certain "free faculties," as they were termed, to be placed under the direction of the bishop, depending for support upon voluntary contributions and each including a faculty of theology, the best known being those of Paris and Lille. The faculty at Marseilles was called upon to unite with the academy of Aix, its faculties being restricted to mathematics and natural science (including a medical school), while faculties of law and philosophy were fixed at Aix, which possessed also the university library. In the capital itself, the University of Paris and the École Pratique des Hautes Études carried on the work of higher instruction independently of each other—the former with faculties of Protestant theology, law, medicine, science, letters and chemistry, distributed over the Quartier Latin; the latter with schools of mathematics, natural science, history, philology and history of religions centred at the Sorbonne.

In 1896 the higher education of France was decentralized and the existing academies, consisting of isolated faculties, were converted into regional universities, while the Sorbonne, from being the University of France, became the University of Paris. The total number of universities, including that of Algiers, was 16.

Germany.—The political storms which marked the close of the 18th and the beginning of the 19th century gave the deathblow to not a few of the ancient universities of Germany. Mainz and Cologne ceased to exist in 1798, Bamberg, Dillingen and Duisburg in 1804, Rinteln and Helmstedt in 1809, Salzburg in 1810 and Erfurt in 1816. Altdorf was united to Erlangen in 1807, Frankfurt-on-Oder to Breslau in 1809 and Wittenberg to Halle in 1815. The University of Ingolstadt was first moved in 1802 to Landshut and from there, in 1826, to Munich, where it was united to the academy of sciences which had been founded in the Bavarian capital in 1759. Münster, in Prussia, which had been constituted a university by Maximilian Frederick (elector and archbishop) in 1771, was abolished in the year 1818; but two faculties, those of theology and philosophy, continued to exist, and in 1843 it received the full privileges of a Prussian university, together with the designation of a royal foundation. Of those of the above centres which altogether ceased to exist, few were much missed or regretted, that at Mainz, which had numbered about 600 students, being the one notable exception. The others had, for the most part, fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revenues and declining numbers, had long ceased worthily to represent the functions of a university. Whatever loss may have attended their suppression was more than compensated by the activity and influence of the three great German universities which were born in the 19th century.

Munich, after having been completely reorganized, soon became a distinguished centre of study in all the faculties, and its numbers, allowing for the wars of 1866 and 1870, continuously increased. The eminence of its professoriate, among whom were J. J. I. von Döllinger, Justus von Liebig, Friedrich von Schelling, K. Zeuss and W. von Giesebrecht, attracted students from all parts of Europe.

The University of Berlin, known as the *Royal* Friedrich Wilhelm university, was founded in 1809, immediately after the peace of Tilsit, when Prussia had been reduced to the level of a third-rate power. It incorporated the famous academy of sciences. Wilhelm von Humboldt, supported by Frederick William III, adopted for it principles which not only raised it to a foremost place among the universities of Europe but also largely conduced to the regeneration of Germany. Attachment to any particular creed or school of thought was expressly repudiated in favour of complete *Lehrfreiheit* ("teaching freedom"). Each teacher presented freely his own views. The growth of the university was astonishing; before the end of the 19th century it had more matriculated students than any university except Vienna.

The University of Bonn, founded in 1818, also by Frederick William III, became known as the *Rhenish* Friedrich Wilhelm university. It was the king's design to introduce into the Rhine provinces the classic literature and the newly developed scientific knowledge of Germany proper. Accordingly, he summoned to his aid the best available talent, including B. G. Niebuhr and A. W. von Schlegel, with C. F. Nasse in medicine and Georg Hermes in theology. In the last-named faculty Bonn combined the opposed schools of theological doctrine of the Evangelical (or Lutheran) and of the Roman Catholic churches.

The German universities underwent considerable changes as a result of the compulsory military service required by the law of 1867, and the events of 1870 were not unconnected with the martial spirit that had been evoked in the student world.

The Low Countries.—The settlement of Europe in 1814–15 created the "Kingdom of the Netherlands" comprising Holland and Belgium. The universities of Franeker and Harderwijk were suppressed and those of Ghent and Liège created in 1815, and a uniform constitution was given to Dutch and Belgian universities. It was provided that there should be attached to each a board of curators, consisting of five persons "distinguished by their love of literature and science and by their rank in society," to be nominated by the king. At least three had to come from the province in which the university was situated. When in 1830 Belgium was created as a separate kingdom, further changes took place there. From Louvain, the chief Catholic centre, the faculties of law, medicine and philosophy had already, in 1788, been moved to Brussels; in 1834 Brussels was constituted a free and independent university with a new fourth faculty of natural science. Having, however, no charter, it continued incapable by law of possessing property. Louvain and Brussels came to represent the two chief political parties in the realm, while the universities of Ghent and Liège recruited their students mainly from the two chief language groups, the Flemish and the Walloon. In Holland, where no such marked differences existed, the universities of Groningen, Leyden and Utrecht were in 1876 assimilated in constitution, each being administered by a consistory of five rectors with a senate composed of the professors in the respective faculties. The opening of the Free University of Amsterdam in 1880 more than repaired the loss of Franeker and Harderwijk, particularly as the progress of this new centre during its first ten years was remarkably rapid.

Scandinavia and Iceland.—The University of Christiania (now Oslo) in Norway was founded in 1811 as a state institution yet given self-government by a *collegium academicum*. It had at first four faculties, theology, law, medicine and philosophy; in 1860 the last was divided into the faculties of letters and science. Women gained admittance in 1882, and the first woman professor

was appointed in 1912. In 1910 the Norwegian Institute of Technology was opened at Trondheim. No new universities were founded in Sweden, though institutions at Göteborg (1887) and Stockholm (1877) achieved something of university status. In Finland, the University of Åbo was moved to Helsingfors (Helsinki) in 1828. In 1911 the University of Iceland was created by bringing together schools of theology (1847), medicine (1876) and law (1908). The university is probably unique in having been conducted for the first 29 years of its life in the parliament building (*Altingishus*).

Switzerland.—In Switzerland the universities shared in the conflicts handed down from the days when the Helvetic republic was first created. In 1832, Basle having joined the League of the Catholic Cantons, the Confederates divided the canton into two and agreed to raise the flourishing *Hochschule,* which already existed at Zürich, to the rank of a university—a measure which may be said to mark a turning point and a new epoch in the history of higher education in the republic. The gymnasium of Berne, originally established under the teaching of Ulrich Zwingli, developed, in 1834, into a university with all the faculties. As early as 1586 Lausanne had been a noted school for the education of Protestant ministers, but it was not until 1806 that chairs of philosophy and law were established, to which those of natural science and literature were added in 1836 and, somewhat later, that of medicine. Not, however, until 1891 was Lausanne formally constituted a university. At Geneva the famous academy of the 16th and 17th centuries, long distinguished as a centre of Calvinistic teaching, became merged in 1876 in a university, where the instruction was given mainly in the French language. With this was also incorporated an earlier school of science in which H. B. de Saussure and A. P. de Candolle had once been teachers. Fribourg, founded in 1889, began with only two faculties, those of law and philosophy, to which one of theology was added in the following year. At Zürich in 1872, and later at Geneva and Berne, women were admitted to lectures, and in 1892 were permitted to lecture.

Austria-Hungary.—The Austrian universities declined rather than advanced during the 19th century. Salzburg, founded in 1623, was suppressed in 1810. Throughout the first half of the century Vienna was in a depressed state; though its medical school attained an unrivalled reputation, its other faculties languished. Olmütz (Olomouc), founded in 1581, was closed in 1853. Lemberg, founded in 1774 by the emperor Joseph II, was in 1805 moved to Cracow, but in 1816 opened on an independent basis. In 1848 it lost by bombardment its buildings, library and natural history museum. Graz (1586) alone flourished. In 1875 Czernowitz university was founded, three years after that of Klausenburg (Cluj), the chief Magyar centre in Hungary. Zagreb, in Croatia, originally founded in 1669, was reopened in 1874.

Russia.—At the beginning of the 19th century Russia possessed only three universities: Moscow (1755), founded by the empress Elizabeth; Vilnius (1578), which was Polish; and Dorpat (Tartu) (1632), which was virtually German. Under the enlightened policy of Alexander I were founded the universities of Kharkov (1804) for New Russia, Kazan (1804) for the countries about the Volga but designed also for the populations of Finland and Siberia, and St. Petersburg (1819). Each of the foregoing six universities had a definite district assigned to it, and, as a further incentive to the pursuit of academic studies, a ukase promulgated in 1809 proclaimed that in all appointments to official posts throughout the empire the holders of university degrees would receive the first consideration. In 1835 the foundation of the St. Vladimir university of Kiev absorbed the university at Vilnius. Odessa, founded in 1865, was designed to be the university of New Russia. Although at St. Petersburg considerable attention was regularly given to the teaching of languages, especially those of Armenia, Georgia and Tartary, the general status of the Russian universities continued, throughout the greater part of the century, exceptionally low. In 1884 they were all reconstituted by the promulgation of a "universal code"; with this the statutes of the universities at Dorpat (1632) and Warsaw (1816) were essentially in agreement. The study of the Slavonic languages received a considerable stimulus, especially when, by a decree in May 1887, the use of the Russian language was made obligatory in all places of instruction throughout the Baltic provinces. During the ensuing 20 years the general influence of Dorpat rapidly spread far beyond the Baltic provinces. In 1889 the Russification of the university went far to deprive it of its claim to be considered German.

The University of Tomsk in western Siberia, founded in 1888, depended chiefly on a grant from the state, aided by private liberality.

Greece.—The University of Otho at Athens, founded by King Otho (Otto) in 1837, was modelled on the university systems of northern Germany. It originally included only four faculties, theology, jurisprudence, medicine and philosophy, to which one of applied mathematics was subsequently added. It was later renamed the National University of Athens.

Rumania, Bulgaria and Turkey.—The University of Jassy (1860) was founded by Prince Cuza of Rumania, and together with the newly founded University of Bucharest received its completed organization in 1864. Both were constituted state institutions and were represented in the senate, although not receiving any fixed revenues from the government. In the Kliment Ochridski university of Sofia (1888) in Bulgaria, faculties were established of history, philology, physics, mathematics and jurisprudence, the main object in view being the training of competent schoolteachers and lawyers and affording them the means of gaining an intelligent insight into the real wants of the native population. The University of Istanbul, founded 1453, was until the 19th century a religious school.

Mediterranean Lands.—The distracted state of Italy long prevented advance. In 1875, when the educational system was reformed, an attempt was made to assimilate the universities to the German pattern, but this policy was quickly reversed. In 1890 four "free universities," Camerino, Ferrara, Perugia and Urbino, were created, and women were admitted. In Sicily the University of Palermo, founded 1779, was closed in 1805 but reopened in 1850 and became of considerable importance and size. The Sardinian universities, Cagliari (1596) and Sassari (1617) were similarly closed and reopened, but attained little eminence.

Spain.—Lifeless routine and unreasoning tradition characterized the Spanish universities until the second half of the 19th century. In 1857 the entire system of education was placed, as in France, under the control of the minister for public instruction. The kingdom was divided into ten university districts, each in the charge of a rector, and a precise plan of instruction was prescribed in which every hour had its appointed lecturer and subject. At every university philosophy, natural science, law and medicine were to be studied, but no provision was made for theology, this being transferred to the seminaries in the episcopal cities. In the same year the University of Manila in the Philippines was formally founded; it had been in existence for 250 years.

(J. B. Mu.; C. Br.; H. C. D.)

THE UNITED STATES

The origins of the universities in the U.S. are to be found in the colleges established in the colonies before the nation was formed. Nine such colleges were founded: Harvard college, 1636; College of William and Mary, 1693; Yale college, 1701; College of New Jersey, 1746; King's college, 1754; College and Academy of Philadelphia, 1755 (originated in a charity school trust created in 1740); Rhode Island college, 1764; Queen's college, 1766; and Dartmouth college, 1770. In general, these institutions represented the arts course provided in the colleges of the universities of England, particularly at Cambridge and Oxford. The principal purpose of the colonial colleges was to train a class of learned men specifically for the Christian ministry, although some of them aimed also at training a body of men in culture and knowledge for service in the state. The College and Academy of Philadelphia, in contrast with the other colleges, was founded on a broad plan of education, which included a considerable amount of mathematics, science, government and law. It established a medical department in 1765—the first in the country. Two years later King's college in New York city also opened a medical department.

From the American Revolution to the Civil War there was a

spectacular increase in the number of new colleges established. During this period some of the older colleges came to be known as universities, and new institutions bearing the name were founded. The constitution of Massachusetts adopted in 1780 refers to Harvard college as the "University at Cambridge." The College and Academy of Philadelphia, through legislative action, became the University of Pennsylvania in 1791, and in 1804 Rhode Island college was named Brown university. The names of three other colonial colleges were officially changed at later dates—Yale college to Yale university, 1887; the College of New Jersey to Princeton university, 1896; King's college to Columbia college, 1784, and to Columbia university, 1912—although all three operated as universities before these dates. Queen's college became Rutgers college in 1825 and Rutgers university in 1924. The legislature of New Hampshire attempted in 1816 to take over Dartmouth college and make of it a state university, but a decision of the United States supreme court in 1819 stopped this action.

The state university, destined to become one of the important and characteristic types of U.S. higher education institutions, had its origin in the latter part of the 18th century: the University of North Carolina was provided for in the state constitution of 1776, chartered in 1789 and opened in 1795; the University of Georgia was chartered in 1785 and opened in 1801. The Indiana constitution of 1816 made it the duty of the general assembly "to provide by law for a general system of education, ascending in a regular gradation from township schools to a state university, wherein tuition shall be gratis, and equally open to all." This statement represents the ideal of the state university—the capstone of the system of public education.

The most notable early example of the state university was the University of Virginia, which, through the influence of Thomas Jefferson, was established by legislative act in 1819 and opened in 1825. The model for the state universities, however, particularly those in the western states, was the University of Michigan, opened in 1841 and reorganized in 1850. The establishment of the state universities in the states carved out of the public lands in the west was greatly aided by grants of land from the federal government, beginning with the admission of Ohio into the union in 1803. The State University of New York, created by the legislature in 1948, was, at mid-20th century, the most recently established state university. It consisted of a number of state-owned institutions of higher education located at various places and of such new ones as might be established.

By the mid-1950s, 47 states each maintained one or more state universities. The state of Pennsylvania supports Pennsylvania State university, a privately controlled institution, and it gives also some financial assistance to several privately controlled universities, including the University of Pennsylvania. Alaska, Hawaii and Puerto Rico maintain territorial universities. Distinguishing characteristics of the typical state university are: (1) creation and direct support by the state government; (2) control by a publicly appointed or elected board; (3) free or low tuition to students who reside in the state; and (4) provision for numerous educational services to the state in addition to instruction on the campus.

Thirteen municipal colleges and universities were established by mid-20th century: College of Charleston (S.C.); College of the City of New York, comprising four colleges; the universities of Akron, Cincinnati, Houston (district), Louisville, Omaha, Toledo and Wichita; and Washburn Municipal university of Topeka, Kan. These institutions are controlled and supported by the municipalities in which they are located.

A group of institutions which became a prominent feature of higher education in the United States are the land-grant colleges and universities, which numbered 68 in 1957. About 200 colleges for women had also been established by mid-century. (*See* WOMEN, EDUCATION OF.)

As large personal fortunes were amassed in the United States another type of university was established—that endowed by individual munificence. Among these universities (with date of original founding) were: Tulane (1834), Emory (1836), Duke (1838), Cornell (1865), Vanderbilt (1873), Johns Hopkins (1876), Stanford (1885) and Chicago (1890). Other highly endowed institutions were the Massachusetts Institute of Technology, founded in 1861 and opened in 1865; Rice institute, 1912; Carnegie Institute of Technology, 1900; and California Institute of Technology, 1891. A number of the older universities also became the recipients of large endowments, among them Columbia, Brown, Dartmouth (college), Harvard, New York, Northwestern, Pennsylvania, Princeton, Rochester, Washington, Western Reserve and Yale. A few state universities likewise acquired large endowments, some from private and some from public sources, among them California, Michigan, Minnesota, Texas, Virginia and Washington. The endowments of these 30 institutions at mid-century ranged from $24,784,000 (Brown) to $450,461,000 (Harvard), the average being $88,123,408. When the federal government was organized, some leaders of the nation desired the establishment of a national university, and subsequently numerous proposals for such an institution were placed before congress, but none was enacted into law. Some of the federal interests are served through institutions maintained by the federal government, such as the United States Military academy; other federal interests are served through certain relationships established with higher education institutions through grants-in-aid, payment for contracted services and loans for the construction of housing for students and faculty members.

Control and Organization.—Some universities are publicly controlled—by a state, a municipality or a district. Others are controlled by private organizations, which usually receive their charters from the states in which they are located. In general, each university is under direct control of a lay board, usually known as a board of trustees, although other titles, such as board of regents and board of directors, are also used. Boards of publicly controlled universities are elected by the voters of the state or the municipality which maintains the institution, or they are chosen by a governmental official or agency. In a few states all the state institutions of higher education are controlled by one board, as in Georgia and Oregon. The members of the boards of privately controlled universities elect persons to fill vacancies; such boards are known as self-perpetuating. The members of the boards that control church-related universities are, in many instances, elected by the religious organizations which maintain the institutions. For many universities the alumni elect some members of the boards of trustees. Most of the Roman Catholic institutions are controlled by the religious orders, though some are under diocesan control.

The actual administration of a university is assigned to administrative officers employed by the board of trustees. Usually the principal officer is called president or sometimes chancellor. He has a heavy responsibility and large authority in the direction and management of the institution. Among his principal assistants are vice-presidents, directors, deans and business managers. The various colleges and schools of the university are in charge of deans, who have large responsibility for such matters as selection of faculty members, leadership in development of the curriculum and improvement of the quality of instruction. Each college or school is organized in departments or divisions, or both, the division being the larger unit. In most universities the faculties have considerable control over educational policy, especially matters relating to admission requirements, organization of the curriculum and requirements for degrees; in the larger universities this control is usually delegated to a smaller group selected entirely or partly by the faculty or by instructional staff members holding certain positions. In the universities the academic year of approximately nine months usually begins in September or early October and ends the latter part of May or early June. The academic calendar is arranged on the semester plan under which the academic year is divided into two equal parts, each of which is called a semester; or it is arranged on the quarter plan under which the academic year is divided into three equal parts, providing terms or "quarters" of about three months in length. Most universities are open also for summer sessions. Some of these students in the summer sessions attend the universities during the academic year; others are teachers of elementary and secondary schools and colleges who are employed and attend only during the summer.

Educational Programs.—Admission to the university generally presupposes the completion of 12 years of elementary and secondary education or the equivalent of such education as measured by some form of entrance examination. Admission is by an examination or by a certificate which attests the satisfactory completion of an educational program in an approved secondary school. In addition to these two means of selection most institutions use also a number of others, among them psychological tests, personal interviews, and confidential information about the applicant's character and moral qualities. At the centre of the typical university in the United States is the college of arts and sciences. Students enter it upon completion of secondary education. The curriculum, which is four years long, leads to the bachelor's degree—bachelor of arts or bachelor of science. The college of arts and sciences offers a program of education for students who take all their work in the arts and sciences, and provides a considerable amount of instruction to students who are registered in the professional schools of the university. The curriculum is usually so arranged as to require the student to obtain a general knowledge of a number of fields and more highly specialized and advanced knowledge in one or two fields.

Most of the formal professional education in the United States is acquired in the universities, where it is organized in various patterns. Much of it consists of four-year programs which students enter upon completion of secondary education and which end with attainment of the bachelor's degree. Examples are agriculture, business administration, education (preparation of teachers of elementary and secondary schools), engineering, fine arts, forestry, journalism and pharmacy. The degrees conferred for the completion of study in special fields frequently carry designation of those fields, as bachelor of education, bachelor of fine arts and bachelor of business administration; or as bachelor of science in education, bachelor of science in engineering, bachelor of science in pharmacy; or as bachelor of arts in education, bachelor of arts in business administration.

There is a tendency to lengthen programs of education for the professions. This is usually done by including, as an entrance requirement of the professional college or school, the completion of a specified amount of study in a college of liberal arts or a college of arts and sciences. As an example, three years of college work constitute a minimum for admission to the study of medicine. The medical curriculum is four years long. The educational patterns in some other fields are: dentistry, two years in college and four years in the school of dentistry; veterinary medicine, two and four; law, three and three or two and four. For admission to professional training in several fields, possession of a bachelor's degree is a prerequisite, and the professional curriculums range in length from one to three years; examples are hospital administration, public health, social work and theology. The first degrees conferred for the completion of curriculums in these professional fields are doctor of medicine, doctor of dental surgery or doctor of dental medicine, bachelor of laws, doctor of veterinary medicine, master of hospital administration (master of business administration, master of science in some schools), master of public health and doctor of public health, master of social work and bachelor of divinity.

All universities, except those that are universities in name only, provide programs of advanced study leading to graduate degrees. Such study is usually supervised by an administrative division known as a graduate school, which establishes and enforces policies and standards for advanced work. The instruction, however, is usually carried on by the regular departments of the university. In some universities the graduate work in professional studies is carried on by the professional schools independent of the graduate school. As a prerequisite for admission to graduate study a student must present a bachelor's or a first professional degree or the equivalent.

The principal purposes of graduate education are: to prepare college and university teachers; to prepare specialists in the various professions; and to prepare students to carry on research. Graduate study also prepares teachers of elementary and secondary schools for better service. Programs of graduate study consist of (1) specialized and advanced courses aimed at broadening and deepening the student's knowledge in one or a few fields and (2) independent study and research, largely original in character, intended to develop ability to do research in a particular field. The degrees conferred for graduate study are the master's degree, usually master of arts or master of science, and the degree of doctor of philosophy. The master's degree is usually obtained for one academic year of graduate work as a minimum; three or more years of study are required for the doctor of philosophy degree. Other types of doctoral degrees comparable with the doctor of philosophy are the doctor of science and the doctor of education. These degrees should not be confused with the doctor of laws (LL.D.), doctor of humane letters (L.H.D.), doctor of letters or doctor of literature (Litt.D.), doctor of divinity (D.D.) and other doctoral degrees which are conferred by colleges and universities as purely honorary distinctions.

Other Services.—Research is an important part of the work of the universities. Some of it is carried on by individual faculty members as a part of their effort to improve themselves and gain professional recognition and advancement. A considerable part of the research, however, is organized in projects for which funds are appropriated to pay the costs. The land-grant colleges and universities maintain agricultural experiment stations, and many colleges of engineering carry on research through their engineering experiment stations. Within a number of universities research institutes have been organized to promote specific types of investigations.

Research in universities is supported from university funds and from funds supplied by foundations, scholarly and professional societies, commercial concerns, state agencies, the federal government and individual donors. The financial assistance takes the form of fellowships and grants-in-aid to mature students and faculty members, and grants and contract payments to the universities. During the year 1953–54 (as an example), $372,643,000 was spent in organized research by higher education institutions.

Research in universities results in the preparation of many scholarly and scientific articles, monographs and books. To facilitate publication of such materials a number of institutions, beginning with Cornell university in 1869, established university presses. In addition to books, these presses publish a number of scholarly periodicals.

Many universities extend their educational services to persons who cannot go to the institution for regular residence instruction. These services are usually grouped under the category of extension work (*see* UNIVERSITY EXTENSION), which includes home-study or correspondence courses, extension classes, short courses and various minor activities. The co-operative agricultural and home economics extension work carried on by the land-grant colleges and universities is supported partly by the federal government.

Statistical Data.—The *Education Directory* for 1956–57 published by the United States office of education of the department of health, education and welfare, listed 1,886 institutions of higher education in the United States. Of this number, 228 bore the name university, but perhaps one-third of these were universities in name only and should more appropriately be called colleges.

In the fall of 1955 the enrolment in institutions of higher education was 2,720,929. Of this number 1,241,101 students were enrolled in 141 universities. (Universities, as defined by the office of education for statistical purposes, are "those institutions of large and complex organization in which several professional schools and colleges, not exclusively technical, are incorporated within the administrative framework of the institution.") The other 1,479,828 students were enrolled in smaller universities and liberal arts colleges, teachers colleges, institutes of technology, technical institutes and other institutions. The largest enrolment in one institution was 38,594; 44 universities and colleges enrolled more than 10,000 each. Graduate students comprised approximately 9% of the enrolment. The numbers of earned degrees conferred by all higher education institutions during the academic year 1954–55 were: bachelor's and first professional, 287,401; master's and second professional, 58,204; doctor's, 8,840.

The amount expended in 1953–54 by all higher education institu-

tions for educational and general purposes, including research but not including expenditures for plant expansion and for noneducational purposes, was $2,271,296,000. At many of the institutions the expenditures ran into millions of dollars; as examples: the University of Illinois $46,946,000; The University of Chicago, $48,819,000; the University of Minnesota, $37,089,000.

The funds which the institutions of higher education received for educational and general purposes during the year 1951–52 were from the following sources: state governments, 32%; student fees, 24%; federal government, 18%; private benefactions, 8%; endowment earnings, 5%; local governments, 4%; others, 9%.

The universities, particularly the larger ones, possess extensive libraries. The book collections of 18 run to more than 1,000,000 volumes each. Some of the largest are: Harvard, 5,956,000; Yale, 4,280,000; Illinois, 2,889,000; Michigan, 2,325,000; Columbia, 2,117,000. (L. E. Bh.)

SOUTH AND CENTRAL AMERICA

The achievement of independence by the Latin-American states was, in some instances at least, accompanied by measures of educational reform. Between 1821 and 1832 nine universities were founded or refounded and survived the many and grievous troubles which wracked the continent throughout the 19th century.

In Peru, Trujillo (1824), founded by Simón Bolívar; Arequipa, raised in 1827 from academy to university status; and Cuzco (founded 1696), which was in the same year transformed from an ecclesiastical to a lay foundation and made open to all, became centres of considerable intellectual activity. In Colombia the foundation of the University of Antioquia at Medellín in 1822 was followed by those of Cartagena (1824) and Popayán (1827). In Argentina arose Buenos Aires (1821), and in Bolivia, La Paz (1831) and Cochabamba (1832). Round the mid-19th century there was a second cluster of foundations. The University of Montevideo in Uruguay dates from 1849, though it became important only when a medical school was added in 1876. In 1843 the University of Costa Rica was founded at San José, and in 1867 the University of Cuenca in Ecuador. In 1842 the century-old University of Havana was reorganized; its subsequent history for 60 years was unhappy, until in 1900 it was refounded with U.S. aid. In 1843 the University of Santiago in Chile (1738) was nationalized, as was also in 1856 that of Córdoba in Argentina (1613). The closing years of the century were also marked by new foundations: La Plata (1890) in Argentina (to be reopened in 1905–08 under the auspices of the University of Philadelphia), the Catholic University of Chile in Santiago (1888), the National University of Paraguay at Asunción (1889) and the University of Guayaquil in Ecuador (1867) among others.

THE FAR EAST
